Apparatus 7 (see *Drug Release* (724)): 30 cycles/min; 2–3 cm amplitude. Follow *Sample preparation A* using a metal spring sample holder (*Figure 5d*). Place one Tablet in the holder with the Tablet orifice facing down, and cover the top of the holder with Parafilm™. At the end of each specified test interval, the systems are transferred to the next row of new test tubes containing 50 mL of fresh *Medium*.

Times: 1-h intervals for a duration of 10 h

Calculate the percentage of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved by using the following method.

Solution A: Dissolve 2.0 g of sodium 1-octanesulfonate in 700 mL of water, mix well, and adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Solution A* (30:70)

Diluent: Acetonitrile and *Medium* (25:75)

Standard stock solution: 0.3 mg/mL of USP Methylphenidate Hydrochloride RS in *Diluent*

Standard solutions: Prepare at least six solutions by making serial dilutions of the *Standard stock solution* in *Diluent* to bracket the expected drug concentration range.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 3.2-mm × 5-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 25 μL

System suitability

Sample: Middle range concentration of the *Standard solutions*

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 2% for the peak response of the analyte; NMT 2% for the retention time of the analyte

Analysis

Samples: *Standard solutions* and the solution under test

Construct a calibration curve by plotting the peak response versus the concentration of the *Standard solutions*. Determine the amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) in each interval by linear regression analysis of the standard curve.

Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved (%)
1	12–32
4	40–60
10	NLT 85
3–6 (avg)	9–15 (/h)

The percentages of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Calculate the average percentage released from 3–6 h:

$$\text{Result} = (Y - X)/3$$

Y = cumulative drug released from 0–6 h

X = cumulative drug released from 0–3 h

For products labeled for dosing every 24 h

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: pH 6.8 phosphate buffer (6.8 g/L of monobasic potassium phosphate in water; adjusted with 2 N sodium hydroxide or 10% phosphoric acid to a pH of 6.80); 900 mL

Apparatus 1: 100 rpm

Times: 0.75, 4, and 10 h

Buffer: pH 4.0 phosphate buffer (2.72 g/L of monobasic potassium phosphate in water; adjusted with 2 N sodium hydroxide or 10% phosphoric acid to a pH of 4.00)

Mobile phase: Acetonitrile and *Buffer* (17.5: 82.5)

Standard solution: 0.06 mg/mL of USP Methylphenidate Hydrochloride RS in 0.1 N hydrochloric acid

Sample solution: Pass a portion of the solution under test through a suitable polytetrafluoroethylene (PTFE) filter of 0.45-μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.0-mm × 5-cm; 2.5-μm packing L1

Column temperature: 50°

Flow rate: See *Table 3*.

Table 3

Time (min)	Flow Rate (mL/min)
0.0	0.75
2.5	0.75
3.0	2.00
6.0	2.00
6.5	0.75
7.0	0.75

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methylphenidate related compound A, the erythro isomer, and methylphenidate are 0.47, 0.65, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i) shown in *Table 4*:

$$\text{Result}_i = (r_u/r_s) \times C_s$$

r_u = sum of the peak responses of methylphenidate and methylphenidate related compound A from the *Sample solution*

r_s = peak response of methylphenidate from the *Standard solution*

C_s = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution*

Calculate the percentage of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved at each time point (i) shown in *Table 4*:

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_s)] + [C_1 \times V_s]\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_s)]] + [(C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

C_i = concentration of methylphenidate hydrochloride in the portion of sample withdrawn at time point (i) (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (h)	Amount Dissolved (%)
1	0.75	12–30
2	4	55–80
3	10	NLT 80

The percentages of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: 0.001 N hydrochloric acid; 500 mL

Apparatus 2: 50 rpm

Times: 1, 2, 6, and 10 h

Mobile phase: Acetonitrile and water (20:80). For every L of *Mobile phase* add 1.0 mL of formic acid and 0.2 mL of trifluoroacetic acid.

Standard solution: 0.02 mg/mL of USP Methylphenidate Hydrochloride RS in *Mobile phase*

Sample solution: Pass a portion of the solution under test through a suitable PTFE filter of 0.45- μ m pore size. Do not use glass fiber filters.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 3.0-mm \times 15-cm; 3- μ m packing L1

Column temperature: 40°

Flow rate: 0.75 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the concentration (C_i) of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i) shown in *Table 5*:

$$Result_i = (r_u/r_s) \times C_s$$

r_u = peak response of methylphenidate from the *Sample solution*

r_s = peak response of methylphenidate from the *Standard solution*

C_s = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution*

Calculate the percentage of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved at each time point (i) shown in *Table 5*:

$$Result_1 = C_i \times V \times (1/L) \times 100$$

$$Result_2 = \{[C_2 \times (V - V_s)] + [C_i \times V_s]\} \times (1/L) \times 100$$

$$Result_3 = \{[C_3 \times [V - (2 \times V_s)]] + [(C_2 + C_i) \times V_s]\} \times (1/L) \times 100$$

$$Result_4 = \{[C_4 \times [V - (3 \times V_s)]] + [(C_3 + C_2 + C_i) \times V_s]\} \times (1/L) \times 100$$

C_i = concentration of methylphenidate hydrochloride in the portion of sample withdrawn at time point (i) (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 5*.

Table 5

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	20–40
2	2	35–55
3	6	65–85
4	10	NLT 80

The percentages of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase: Dissolve 2 g of sodium-1-octanesulfonate in 730 mL of water. Adjust with phosphoric acid to a pH of 2.7. Mix with 270 mL of acetonitrile.

Solution A: Acidified water; adjusted with phosphoric acid to a pH of 3

Diluent A: Acetonitrile and *Solution A* (25:75)

Diluent B: Acetonitrile and methanol (50:50)

System suitability solution: 80 μ g/mL of USP

Methylphenidate Hydrochloride RS, 1 μ g/mL of methylphenidate hydrochloride erythro isomer from USP Methylphenidate Hydrochloride Erythro Isomer Solution RS, and 2 μ g/mL of USP Methylphenidate Related Compound A RS in *Diluent A*

Standard solution: 0.2 μ g/mL of USP Methylphenidate Hydrochloride RS, 0.5 μ g/mL of methylphenidate hydrochloride erythro isomer from USP Methylphenidate Hydrochloride Erythro Isomer Solution RS, and 1.5 μ g/mL of USP Methylphenidate Related Compound A RS in *Diluent A*

Sample stock solution: Nominally 1 mg/mL of methylphenidate hydrochloride prepared as follows. Dissolve NLT 10 Tablets in a suitable volumetric flask with 20% of the total flask volume of *Diluent B*. [NOTE—Alternatively, a portion of powder from NLT 10 Tablets may be transferred to a suitable volumetric flask and suspended in 20% of the total flask volume of *Diluent B*.] Stir for 4 h. Dilute with *Solution A* to volume.

Sample solution: 0.1 mg/mL of methylphenidate hydrochloride in *Solution A* from the *Sample stock solution*. [NOTE—Centrifuge before chromatographic analysis.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm \times 15-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 25 μ L

Run time: 2 times the retention time of methylphenidate

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 6.0 between the methylphenidate and erythro isomer peaks

Tailing factor: NMT 2.0 for the methylphenidate peak

Relative standard deviation: NMT 2.0% for the methylphenidate peak; NMT 4.0% each for the methylphenidate related compound A and erythro isomer peaks

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of methylphenidate related compound A or erythro isomer in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of methylphenidate related compound A or erythro isomer from the *Sample solution*
 r_S = peak response of methylphenidate related compound A or erythro isomer from the *Standard solution*
 C_S = concentration of USP Methylphenidate Related Compound A RS or methylphenidate hydrochloride erythro isomer in the *Standard solution* (mg/mL)
 C_U = nominal concentration of methylphenidate hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each unspecified degradation product from the *Sample solution*
 r_S = peak response of USP Methylphenidate Hydrochloride RS from the *Standard solution*
 C_S = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of methylphenidate hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 6.

Table 6

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methylphenidate related compound A	0.47	1.5
Erythro isomer ^a	0.65	0.5
Methylphenidate	1.0	—
Any unspecified degradation product	—	0.2
Total degradation products	—	2.5

^a Methyl (RS,SR)-2-phenyl-2-(piperidin-2-yl) acetate.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- LABELING:** The labeling states the *Dissolution* test with which the product complies if other than *Test 1*.
- USP REFERENCE STANDARDS (11)**
 - USP Methylphenidate Hydrochloride RS
 - USP Methylphenidate Hydrochloride Erythro Isomer Solution RS
 - This solution contains 0.5 mg of methylphenidate hydrochloride erythro isomer per mL in methanol.
 - USP Methylphenidate Related Compound A RS
 - α -Phenyl-2-piperidineacetic acid hydrochloride.
 - $C_{13}H_{17}NO_2 \cdot HCl$ 255.74

Methylprednisolone

$C_{22}H_{30}O_5$ 374.47

Pregna-1,4-diene-3,20-dione, 11,17,21-trihydroxy-6-methyl-, (6 α ,11 β)-, 11 β ,17,21-Trihydroxy-6 α -methylpregna-1,4-diene-3,20-dione [83-43-2].

» Methylprednisolone contains not less than 97.0 percent and not more than 103.0 percent of $C_{22}H_{30}O_5$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—
USP Methylprednisolone RS

Identification

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 10 μ g per mL.

Medium: alcohol.

Absorptivities at 243 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: Dissolve about 5 mg in 2 mL of sulfuric acid: a red color is produced.

Specific rotation (781S): between +79° and +86°.

Test solution: 5 mg per mL, in dioxane.

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.2%.

Chromatographic purity

Mobile phase—Prepare a filtered and degassed mixture of water, tetrahydrofuran, dimethyl sulfoxide, and butanol (149:40:10:1). Make adjustments if necessary (see *System Suitability in Chromatography* (621)).

Diluting solution—Prepare a filtered mixture of water, tetrahydrofuran, and glacial acetic acid (72:25:3).

Standard solution—Dissolve an accurately weighed quantity of USP Methylprednisolone RS in *Diluting solution*. Dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 0.01 mg per mL.

Test solution—Transfer about 25 mg of Methylprednisolone, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluting solution* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 20-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 800 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the

peak responses. Calculate the percentage of each impurity in the portion of Methylprednisolone taken by the formula:

$$100(C_s / C_u)(r_i / r_s)$$

in which C_s and C_u are the concentrations, in mg per mL, of Methylprednisolone in the *Standard solution* and the *Test solution*, respectively; r_i is the peak response for each impurity obtained from the *Test solution*; and r_s is the peak response for methylprednisolone in the *Standard solution*: not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

Assay—

Mobile phase—Prepare a solution containing a mixture of butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30).

Internal standard solution—Dissolve prednisone in a 3 in 100 solution of glacial acetic acid in chloroform to obtain a solution having a concentration of about 0.2 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Methylprednisolone RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Using about 10 mg of Methylprednisolone, accurately weighed, proceed as directed for *Standard preparation*.

Chromatographic system (see *Chromatography*)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 25-cm column that contains packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between the methylprednisolone and internal standard peaks is not less than 4.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks: the relative retention times are about 0.7 for prednisone and 1.0 for methylprednisolone. Calculate the quantity, in percent, of $C_{22}H_{30}O_5$ in the portion of Methylprednisolone taken by the formula:

$$100(C_s / C_u)(R_u / R_s)$$

in which C_s is the concentration of methylprednisolone, in mg per mL, in the *Standard preparation*; C_u is the nominal concentration, in mg per mL, of Methylprednisolone in the *Assay preparation*; and R_u and R_s are the ratios of the peak responses for the methylprednisolone peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methylprednisolone Tablets

» Methylprednisolone Tablets contain not less than 92.5 percent and not more than 107.5 percent of the labeled amount of methylprednisolone ($C_{22}H_{30}O_5$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Methylprednisolone RS

Identification—Powder a number of Tablets, equivalent to about 40 mg of methylprednisolone, and digest with 25 mL of solvent hexane for 15 minutes. Filter, and discard the fil-

trate. Digest the residue with 25 mL of chloroform for 15 minutes. Filter, evaporate the filtrate to dryness, and dry at 105° for 2 hours: the residue so obtained responds to *Identification tests A and C* under *Methylprednisolone*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Measure the UV absorption of filtered aliquots removed from the *Dissolution Medium* and suitably diluted, if necessary, in 1-cm cells at 246 nm, with a suitable spectrophotometer, using water as the blank and utilizing a standard curve, representing the absorbance versus concentration of USP Methylprednisolone RS. [NOTE—Dissolve about 20 mg of USP Methylprednisolone RS, accurately weighed, in 1 mL of alcohol, dilute in a 1000-mL volumetric flask with water to volume, and mix. Prepare quantitative dilutions of this solution for the development of a standard curve.]

Tolerances—Not less than 70% (Q) of the labeled amount of $C_{22}H_{30}O_5$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Mobile phase, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the Assay under *Methylprednisolone*.

Test preparation—Place 1 Tablet in a suitable container. For tablet labeled strengths of 10 mg or less, add 0.5 mL of water. For tablet labeled strengths greater than 10 mg, add 1.0 mL of water. Allow the tablet to stand for about 2 minutes, then swirl the container to disperse the tablet. Add 5.0 mL of *Internal standard solution* for each mg of labeled tablet strength, shake for 15 minutes, and filter or centrifuge a portion of the test specimen. Analyze the clear solution as directed under *Procedure*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Methylprednisolone*. Calculate the quantity, in mg, of $C_{22}H_{30}O_5$ in the Tablet taken by the formula:

$$(FW_s)(R_u / R_s)$$

in which F is the ratio of the volume of *Internal standard preparation*, in mL, in the *Test preparation* to the volume, in mL, of the *Internal standard preparation* in the *Standard preparation*; W_s is the weight, in mg, of USP Methylprednisolone RS taken for the *Standard preparation*; and the other terms are as defined for *Procedure* in the Assay under *Methylprednisolone*.

Assay—

Mobile phase, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the Assay under *Methylprednisolone*.

Assay preparation—Accurately weigh 20 Tablets, and grind to a fine powder in a mortar and pestle. Accurately weigh a portion of the powder, equivalent to about 10 mg of methylprednisolone, and transfer to a suitable container. Add 2.5 mL of water to the ground tablet material and swirl to form a fine slurry. Add 50.0 mL of *Internal standard solution*, and shake for 15 minutes. Filter or centrifuge a portion of the liquid so obtained, if necessary, and analyze the clear solution as directed under *Procedure*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Methylprednisolone*. Calculate the quantity, in mg, of $C_{22}H_{30}O_5$ in the portion of Tablets taken by the formula:

$$50C(R_u / R_s)$$

in which the terms are as defined therein.

Methylprednisolone Acetate

$C_{24}H_{32}O_6$ 416.51
 Pregna-1,4-diene-3,20-dione, 21-(acetyloxy)-11,17-dihydroxy-6-methyl-, (6 α ,11 β)-;
 11 β ,17,21-Trihydroxy-6 α -methylpregna-1,4-diene-3,20-dione 21-acetate [53-36-1].

DEFINITION

Methylprednisolone Acetate contains NLT 97.0% and NMT 103.0% of methylprednisolone acetate ($C_{24}H_{32}O_6$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)
 - Analytical wavelength: 243 nm
 - Standard solution: 10 μ g/mL of USP Methylprednisolone Acetate RS in alcohol
 - Sample solution: 10 μ g/mL of methylprednisolone acetate in alcohol
 - Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

ASSAY

- **PROCEDURE**
 - Mobile phase: *n*-Butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)
 - Internal standard solution: 6 mg/mL of prednisone prepared as follows. Transfer an appropriate amount of prednisone to a suitable volumetric flask. Add 3% of the flask volume of glacial acetic acid, and sonicate. Dilute with chloroform to volume, slowly adding the chloroform. Sonicate, and shake to dissolve.
 - Standard solution: 0.2 mg/mL of USP Methylprednisolone Acetate RS prepared as follows. Transfer an appropriate amount of USP Methylprednisolone Acetate RS to a suitable volumetric flask, and add 5% of the flask volume of the *Internal standard solution*. Dilute with chloroform to volume, and shake to dissolve.
 - Sample solution: 0.2 mg/mL of Methylprednisolone Acetate prepared as follows. Transfer an appropriate amount of methylprednisolone acetate to a suitable volumetric flask, and add 5% of the flask volume of the *Internal standard solution*. Dilute with chloroform to volume, and shake to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 25-cm; packing L3

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methylprednisolone acetate and prednisone are about 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 2.5 between methylprednisolone acetate and prednisone

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of methylprednisolone acetate ($C_{24}H_{32}O_6$) in the portion of Methylprednisolone Acetate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak height ratio of methylprednisolone acetate to prednisone from the *Sample solution*

R_S = peak height ratio of methylprednisolone acetate to prednisone from the *Standard solution*

C_S = concentration of USP Methylprednisolone Acetate RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylprednisolone Acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

ORGANIC IMPURITIES

Mobile phase: Tetrahydrofuran and water (51:149)

Diluent: Tetrahydrofuran, acetonitrile, glacial acetic acid, and water (250:250:1:499)

Standard solution: 20 μ g/mL of USP Methylprednisolone Acetate RS in *Diluent*. Sonicate, if necessary, to dissolve.

Sample solution: 1 mg/mL of Methylprednisolone Acetate in *Diluent*. Sonicate, if necessary, to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Methylprednisolone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response for methylprednisolone acetate from the *Standard solution*

C_S = concentration of USP Methylprednisolone Acetate RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylprednisolone Acetate in the *Sample solution* (mg/mL)

Acceptance criteria

Any individual impurity: NMT 1.0%

Total impurities: NMT 2.0%

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S)

Sample solution: 10 mg/mL in dioxane

Acceptance criteria: +97° to +105°

- **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

- **USP REFERENCE STANDARDS** (11)

USP Methylprednisolone Acetate RS

Methylprednisolone Acetate Cream

DEFINITION

Methylprednisolone Acetate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of methylprednisolone acetate ($C_{24}H_{32}O_6$).

IDENTIFICATION**• A.**

Analysis: Use the thin-layer chromatogram, prepared as directed in *Analysis 1* in the *Assay*.

Acceptance criteria: The R_f value of the principal spot from the *Sample stock solution* corresponds to that from the *Standard stock solution*.

ASSAY**• PROCEDURE**

(See *Chromatography* (621).)

Solution A: Alcohol and chloroform (1:1)

Solution B: Alcohol and tetramethylammonium hydroxide TS (9:1)

Standard stock solution: 500 µg/mL of USP Methylprednisolone Acetate RS in *Solution A*

Sample stock solution: Transfer the equivalent of 5 mg of methylprednisolone acetate from Cream to a 125-mL separator, and add 50 mL of solvent hexane. Extract with three 10-mL portions of acetonitrile, and evaporate the combined extracts on a steam bath with the aid of a current of air nearly to dryness. Transfer the residue to a 10-mL volumetric flask with the aid of one 5-mL portion and two 2-mL portions of *Solution A*, and dilute with *Solution A* to volume.

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture

Application volume: 250 µL

Developing solvent system: Ethyl acetate and chloroform (7:5)

Analysis 1

Samples: *Standard stock solution* and *Sample stock solution*

Divide the plate into three equal sections, with the left and right sections to be used for the *Sample stock solution* and *Standard stock solution*, respectively, and the center section for the blank. Apply the solutions as streaks 2.5 cm from the bottom of the designated section of the plate, and dry the streaks with the aid of a current of air. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Locate the principal bands from the *Standard stock solution* and the *Sample stock solution* (see also *Identification test A*) by viewing under short-wavelength UV light.

Standard solution, Sample solution, and Blank: Mark the *Standard stock solution* and *Sample stock solution* bands and the corresponding band section for the *Blank* on the TLC plate from *Analysis 1*. Quantitatively remove the silica gel containing these bands, and transfer to separate glass-stoppered, 50-mL centrifuge tubes. Add 25.0 mL of alcohol to each tube, shake for 2 min, and centrifuge for 5 min. Transfer 20.0 mL of each supernatant to separate glass-stoppered, 50-mL conical flasks. Add 2.0 mL of blue tetrazolium TS to each solution, mix, and add 2.0 mL of *Solution B* to each flask. Mix, and allow the solutions to stand in the dark for 90 min.

Instrumental conditions

Mode: Vis

Analytical wavelength: Maximum absorbance at about 525 nm

Cell: 1 cm

Analysis 2

Samples: *Standard solution*, *Sample solution*, and *Blank*
Determine the absorbances of the *Standard solution* and the *Sample solution* at the wavelength of maximum absorbance against the *Blank*.

Calculate the percentage of the labeled amount of methylprednisolone acetate ($C_{24}H_{32}O_6$) in the portion of Cream taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methylprednisolone Acetate RS in the *Standard stock solution* (µg/mL)

C_U = nominal concentration of methylprednisolone in the *Sample stock solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- MINIMUM FILL (755):** Meets the requirements

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers, protected from light.
- USP REFERENCE STANDARDS (11)**
USP Methylprednisolone Acetate RS

Methylprednisolone Acetate Injectable Suspension

DEFINITION

Methylprednisolone Acetate Injectable Suspension is a sterile suspension of Methylprednisolone Acetate in a suitable aqueous medium. It contains NLT 90.0% and NMT 110.0% of the labeled amount of methylprednisolone acetate ($C_{24}H_{32}O_6$).

IDENTIFICATION**• A. INFRARED ABSORPTION (197K)**

Sample: Nominally 100 mg of methylprednisolone acetate from Injectable Suspension

Analysis: Filter the *Sample* through paper. Wash the residue with several 5-mL portions of water, and dry at 105° for 3 h.

Acceptance criteria: Meets the requirements

ASSAY**• PROCEDURE**

Mobile phase: *n*-Butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)

Internal standard solution: 6 mg/mL of prednisone prepared as follows. Transfer an appropriate amount of prednisone to a suitable volumetric flask. Add 3% of the flask volume of glacial acetic acid, and sonicate. Dilute with chloroform to volume, slowly adding the chloroform. Sonicate, and shake to dissolve.

Standard solution: 0.2 mg/mL of USP Methylprednisolone Acetate RS prepared as follows. Transfer an appropriate amount of USP Methylprednisolone Acetate RS to a suitable volumetric flask, and add 5% of the flask volume of the *Internal standard solution*. Dilute with chloroform to volume, and shake to dissolve.

Sample solution: Swirl Injectable Suspension to ensure uniformity before analysis. Transfer a suitable quantity of Injectable Suspension equivalent to 40 mg of methylprednisolone acetate to a 25-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, dilute with chloroform to volume, and shake for 15 min or until the aqueous layer is clear. Transfer 4.0 mL of the chloroform layer to a suitable vial, add 30 mL of chloroform and a small quantity (about 400 mg) of anhydrous sodium sulfate, shake for 5 min. Use the clear solution.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4-mm × 25-cm; packing L3**Flow rate:** 1 mL/min**Injection volume:** 10 µL**System suitability****Sample:** *Standard solution*

[NOTE—The relative retention times for methylprednisolone acetate and prednisone are 1.0 and 1.3, respectively.]

Suitability requirements**Resolution:** NLT 2.5 between methylprednisolone acetate and prednisone**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of methylprednisolone acetate (C₂₄H₃₂O₆) in the portion of Injectable Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

 R_U = peak height ratio of methylprednisolone acetate to prednisone from the *Sample solution* R_S = peak height ratio of methylprednisolone acetate to prednisone from the *Standard solution* C_S = concentration of USP Methylprednisolone Acetate RS in the *Standard solution* (mg/mL) C_U = nominal concentration of methylprednisolone acetate in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

SPECIFIC TESTS

- **pH** (791): 3.0–7.0
- **PARTICLE SIZE**

Analysis: Transfer 1 drop to a microscope slide, and spread it evenly, diluting with water if necessary, to decrease the density of the field. Examine the slide under a microscope equipped with a calibrated ocular micrometer, using 400× magnification. Scan the entire slide, and note the size of the individual particles.

Acceptance criteria: NLT 99% of the particles are less than 20 µm in length when measured along the longest axis, and NLT 75% of the particles are less than 10 µm.

- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS** (11)
USP Methylprednisolone Acetate RS

Methylprednisolone Hemisuccinate

C₂₆H₃₄O₈ 474.54

Methylprednisolone Sodium Succinate

$C_{26}H_{33}NaO_8$ 496.53

Pregna-1,4-diene-3,20-dione, 21-(3-carboxy-1-oxopropoxy)-11,17-dihydroxy-6-methyl-, monosodium salt, (6α,11β)-; 11β,17,21-Trihydroxy-6α-methylpregna-1,4-diene-3,20-dione 21-(sodium succinate) [2375-03-3].

DEFINITION

Methylprednisolone Sodium Succinate contains NLT 97.0% and NMT 103.0% of methylprednisolone sodium succinate ($C_{26}H_{33}NaO_8$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION

Sample: 100 mg of Methylprednisolone Sodium Succinate

Analysis: Transfer the *Sample* to a separator, dissolve in 10 mL of water, add 1 mL of 3 N hydrochloric acid, and extract immediately with 50 mL of chloroform. Filter the chloroform extract through cotton, evaporate on a steam bath to dryness, and dry under vacuum at 60° for 3 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as those of a similar preparation of USP Methylprednisolone Hemisuccinate RS.

• B. ULTRAVIOLET ABSORPTION (197U)

Standard solution: 20 μg/mL of USP Methylprednisolone Hemisuccinate RS in methanol

Sample solution: 20 μg/mL of Methylprednisolone Sodium Succinate in methanol

Analytical wavelength: 243 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

• C. The sample imparts an intense yellow color to a nonluminous flame.

ASSAY

• PROCEDURE

Solution A: 5 mg/mL of blue tetrazolium in alcohol

Solution B: Alcohol and tetramethylammonium hydroxide TS (9:1)

Standard solution: Proceed as directed for *Assay for Steroids* (351), *Standard Preparation*, preparing 12.5 μg/mL of USP Methylprednisolone Hemisuccinate RS in alcohol.

Sample solution: 12.5 μg/mL of Methylprednisolone Sodium Succinate in alcohol

Blank: Alcohol

Instrumental conditions

Mode: Vis

Analytical wavelength: 525 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Pipet 20.0 mL of the *Blank*, *Standard solution*, and *Sample solution* into three different glass-stoppered, 50-mL conical flasks. Add 2.0 mL of *Solution A*, and mix. To each flask add 4.0 mL of *Solution B*. Mix, and allow to stand in the dark for 90 min. Add 1.0 mL of glacial acetic acid, and mix. Without delay, determine the absorbances of the *Standard solution* and the *Sample solution* against the *Blank*.

Calculate the percentage of methylprednisolone sodium succinate ($C_{26}H_{33}NaO_8$) in the portion of Methylprednisolone Sodium Succinate taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methylprednisolone Hemisuccinate RS in the *Standard solution* (μg/mL)

C_U = concentration of Methylprednisolone Sodium Succinate in the *Sample solution* (μg/mL)

M_{r1} = molecular weight of methylprednisolone sodium succinate, 496.53

M_{r2} = molecular weight of methylprednisolone hemisuccinate, 474.54

Acceptance criteria: 97.0%–103.0% on the dried basis

OTHER COMPONENTS

• SODIUM CONTENT

Sample solution: Dissolve, with gentle heating, about 1 g of Methylprednisolone Sodium Succinate in 75 mL of glacial acetic acid. Add 20 mL of dioxane, then add 1 drop of crystal violet TS.

Titrimetric system

Mode: Direct

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Titrate with *Titrant* to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 2.299 mg of sodium (Na).

Acceptance criteria: 4.49%–4.77% on the dried basis

SPECIFIC TESTS• **OPTICAL ROTATION (781S), Specific Rotation**

Sample solution: 10 mg/mL of Methylprednisolone Sodium Succinate in alcohol

Acceptance criteria: +96° to +104°

• **LOSS ON DRYING (731)**

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 3.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Methylprednisolone Hemisuccinate RS

Methylprednisolone Sodium Succinate for Injection

DEFINITION

Methylprednisolone Sodium Succinate for Injection is a sterile mixture of Methylprednisolone Sodium Succinate with suitable buffers. It may be prepared from Methylprednisolone Sodium Succinate or from Methylprednisolone Hemisuccinate with the aid of Sodium Hydroxide or Sodium Carbonate. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of methylprednisolone ($C_{22}H_{30}O_5$) in the volume of constituted solution designated on the label.

IDENTIFICATION• **A. INFRARED ABSORPTION**

Sample: Nominally 100 mg of methylprednisolone sodium succinate from Methylprednisolone Sodium Succinate for Injection

Analysis: Transfer the *Sample* to a separator, dissolve in 10 mL of water, add 1 mL of 3 N hydrochloric acid, and extract immediately with 50 mL of chloroform. Filter the chloroform extract through cotton, evaporate on a steam bath to dryness, and dry under vacuum at 60° for 3 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as those of a similar preparation of USP Methylprednisolone Hemisuccinate RS.

ASSAY• **PROCEDURE**

Diluent: Chloroform and glacial acetic acid (97:3)

Mobile phase: Butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)

Standard stock solution: 0.30 mg/mL of USP Methylprednisolone RS in *Diluent*

Internal standard solution: 3 mg/mL of USP Fluorometholone RS in tetrahydrofuran

Standard solution: 0.65 mg/mL of USP Methylprednisolone Hemisuccinate RS prepared as follows.

Transfer an appropriate amount of USP Methylprednisolone Hemisuccinate RS to a suitable volumetric flask. Pipet 10% of the flask volume of the *Internal stan-*

ard solution and 10% of the flask volume of the *Standard stock solution*. Dilute with *Diluent* to volume.

Sample solution: Transfer a suitable quantity of constituted solutions (mix the constituted solutions prepared from the contents of 10 vials of Methylprednisolone Sodium Succinate for Injection) equivalent to 50 mg of methylprednisolone to a suitable flask containing 10.0 mL of the *Internal standard solution*, and dilute with *Diluent* to 100.0 mL. Shake thoroughly for 5 min, then allow the phases to separate, discarding the upper phase.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L3

Flow rate: 1 mL/min

Injection volume: 6 µL

[NOTE—The order of elution of peaks in the *Standard solution* is as follows. Internal standard peak, methylprednisolone hemisuccinate peak, and successive smaller peaks of free methylprednisolone and methylprednisolone 17-hemisuccinate.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylprednisolone ($C_{22}H_{30}O_5$) in the portion of constituted Methylprednisolone Sodium Succinate for Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

R_U = ratio of the sum of the peak areas for methylprednisolone hemisuccinate and methylprednisolone 17-hemisuccinate to the peak area of the internal standard from the *Sample solution*

R_S = ratio of the sum of the peak areas for methylprednisolone hemisuccinate and methylprednisolone 17-hemisuccinate to the peak area of the internal standard from the *Standard solution*

C_S = concentration of USP Methylprednisolone Hemisuccinate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methylprednisolone in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of methylprednisolone, 374.47

M_{r2} = molecular weight of methylprednisolone hemisuccinate, 474.54

To this calculated amount, add the percentage of free methylprednisolone found in the test for *Free Methylprednisolone*.

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS• **FREE METHYLPREDNISOLONE****Analysis**

Samples: *Standard solution* and *Sample solution*

Using the chromatograms obtained in the *Assay*, measure the areas of the peaks from the internal standard and free methylprednisolone.

Calculate the percentage of free methylprednisolone in the portion of *Sample solution* taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of the free methylprednisolone to the internal standard from the *Sample solution*

R_S = peak area ratio of the free methylprednisolone to the internal standard from the *Standard solution*

- C_S = concentration of USP Methylprednisolone RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of methylprednisolone in the *Sample solution* (mg/mL)

Acceptance criteria: The amount of free methylprednisolone is NMT 6.6% of the labeled amount of methylprednisolone ($C_{22}H_{30}O_5$).

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

SPECIFIC TESTS

- **pH** (791)
Sample solution: 50 mg/mL of methylprednisolone sodium succinate
Acceptance criteria: 7.0–8.0
- **STERILITY TESTS** (71): Meets the requirements
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.17 USP Endotoxin Units/mg of methylprednisolone
- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 3 h.

 Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Methyltestosterone RS

Methyltestosterone Tablets

DEFINITION

Methyltestosterone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methyltestosterone ($C_{20}H_{30}O_2$).

IDENTIFICATION• **A. INFRARED ABSORPTION**

Sample: Evaporate to dryness 25 mL of the *Sample stock solution* from the *Assay*.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima at the same wavelengths as those of a similar preparation of USP Methyltestosterone RS.

ASSAY• **PROCEDURE**

Standard solution: 10 µg/mL of USP Methyltestosterone RS in alcohol

Sample stock solution: Nominally 0.2 mg/mL of methyltestosterone prepared as follows. Transfer the equivalent to 10 mg of methyltestosterone from NLT 20 powdered Tablets to a 125-mL separator with the aid of about 5 mL of water. Extract with four 25-mL portions of chloroform, filtering each through chloroform-washed cotton. Evaporate the combined extracts on a steam bath, with the aid of a current of air, to dryness. Dissolve the residue in alcohol, transfer to a 50-mL volumetric flask, and dilute with alcohol to volume.

Sample solution: Nominally 10 µg/mL of methyltestosterone in alcohol from the *Sample stock solution*

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 241 nm

Cell: 1 cm

Blank: Alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methyltestosterone ($C_{20}H_{30}O_2$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of USP Methyltestosterone RS in the *Standard solution* (µg/mL)
 C_U = nominal concentration of methyltestosterone in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISINTEGRATION (701)**

Time: 30 min

Acceptance criteria: Tablets intended for buccal administration meet the requirements for *Buccal Tablets*.

• **UNIFORMITY OF DOSAGE UNITS (905)****Procedure for content uniformity**

Standard solution: 0.010 mg/mL of USP Methyltestosterone RS in methanol

Sample stock solution: Transfer 1 finely powdered Tablet to a 100-mL volumetric flask. Add 50 mL of methanol, and shake by mechanical means for 60 min. Dilute with methanol to volume, and filter, discarding the first 20 mL of the filtrate.

Sample solution: Dilute a suitable volume of the *Sample stock solution* with methanol to obtain 0.010 mg/mL of methyltestosterone.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 241 nm

Cell: 1 cm

Blank: Methanol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methyltestosterone ($C_{20}H_{30}O_2$) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times D \times 100$$

- A_U = absorbance of methyltestosterone from the *Sample solution*
 A_S = absorbance of methyltestosterone from the *Standard solution*
 C_S = concentration of USP Methyltestosterone RS in the *Standard solution* (mg/mL)
 L = label claim (mg/Tablet)
 V = volume of the *Sample solution* (mL)
 D = dilution factor of the *Sample solution*
 Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Methyltestosterone RS

Methysergide Maleate

$C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$ 469.53
 Ergoline-8-carboxamide, 9,10-didehydro-N-[1-(hydroxymethyl)propyl]-1,6-dimethyl-, (8β)-, (Z)-2-butenedioate (1:1) (salt);
 9,10-Didehydro-N-[1-(hydroxymethyl)propyl]-1,6-dimethylethylergoline-8β-carboxamide maleate (1:1) (salt) [129-49-7].

DEFINITION

Methysergide Maleate contains NLT 97.0% and NMT 103.0% of methysergide maleate ($C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION** (197K)• **B. THIN-LAYER CHROMATOGRAPHY**

Conduct this test without exposure to daylight and with minimum exposure to artificial light.

Standard solution: 5 mg/mL of USP Methysergide Maleate RS in methanol

Sample solution: 5 mg/mL of Methysergide Maleate in methanol

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 25 μ L

Developing solvent: Chloroform and methanol (20:1)

Spray reagent: 8 mg/mL of *p*-dimethylaminobenzaldehyde in a cooled mixture of alcohol and sulfuric acid (8:2)

Analysis

Samples: *Standard solution* and *Sample solution*

In the chromatographic chamber, place a volume of the *Developing solvent* sufficient to develop the chromatogram. Place a beaker containing 25 mL of ammonium hydroxide in the chamber, cover, and allow to equilibrate for 30 min. Apply the *Samples*, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with *Spray reagent*. Allow the plate to dry, then expose it briefly to fumes of a mixture of nitric and hydrochloric acids.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY• **PROCEDURE**

Sample solution: 200 mg of Methysergide Maleate in 30 mL of glacial acetic acid. Add 1 drop of crystal violet TS.

Analysis: Titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 46.95 mg of methysergide maleate ($C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$).

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES• **ORDINARY IMPURITIES** (466)

Standard solution and Sample solution: Methanol

Eluant: Use the *Developing solvent* from *Identification* test B.

Visualization: 1

Acceptance criteria: Meets the requirements

SPECIFIC TESTS• **OPTICAL ROTATION, Specific Rotation** (781S)

Sample solution: 2.5 mg/mL in water

Acceptance criteria: +35° to +45°

• **PH** (791)

Sample solution: 1 in 500 in carbon dioxide-free water

Acceptance criteria: 3.7–4.7

• **LOSS ON DRYING** (731)

Analysis: Dry a sample under vacuum at 120° for 2 h.

Acceptance criteria: NMT 7.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a cold place.

• **USP REFERENCE STANDARDS** (11)

USP Methysergide Maleate RS

Methysergide Maleate Tablets**DEFINITION**

Methysergide Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methysergide maleate ($C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$).

IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Conduct this procedure with a minimum exposure to light.

Mobile phase: Dissolve 6.8 g of monobasic potassium phosphate in 700 mL of water, add 300 mL of acetonitrile, and mix.

Diluent: Methanol and 10 g/L of tartaric acid (50:50)

Standard solution: 0.1 mg/mL of USP Methysergide Maleate RS in *Diluent*

[NOTE—Sonication may be used.]

Sample solution: Nominally 0.1 mg/mL of methysergide maleate prepared as follows. Transfer a portion of NLT 20 finely powdered Tablets equivalent to NLT 10 mg of methysergide maleate to a suitable volumetric flask. Add 75% of the flask volume with *Diluent*. Shake by mechanical means for 60 min. Dilute with *Diluent* to volume. Filter, and discard the first 20 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 318 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Flow rate: 2 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 1.0 between the analyte and the closest adjacent peak

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methysergide maleate

($C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methysergide Maleate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methysergide maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: Tartaric acid solution (1 in 200); 900 mL

Apparatus 2: 100 rpm

Time: 30 min

Standard solution: 0.002 mg/mL of USP Methysergide Maleate RS in *Medium*

Sample solution: Portions of the solution under test suitably diluted with *Medium*

Instrumental conditions

Mode: Fluorescence
 Excitation wavelength: 327 nm
 Emission wavelength: 428 nm
 Blank: Tartaric acid solution (1 in 200)

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of the labeled amount of methysergide maleate ($C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance from the *Sample solution*
 A_S = absorbance from the *Standard solution*
 C_S = concentration of USP Methysergide Maleate RS in the *Standard solution* (mg/mL)
 V = volume of *Medium*, 900 mL
 L = label claim of methysergide maleate (mg/Tablet)

Tolerances: NLT 70% (Q) of the labeled amount of methysergide maleate ($C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store below 30°.
- **USP REFERENCE STANDARDS** (11)
 USP Methysergide Maleate RS

Metoclopramide Hydrochloride

$C_{14}H_{22}ClN_3O_2 \cdot HCl \cdot H_2O$ 354.27
 Benzamide, 4-amino-5-chloro-N-[2-(diethylamino)ethyl]-2-methoxy-, monohydrochloride, monohydrate;
 4-Amino-5-chloro-N-[2-(diethylamino)ethyl]-o-anisamide monohydrochloride monohydrate [54143-57-6].

DEFINITION

Metoclopramide Hydrochloride contains NLT 98.0% and NMT 101.0% of metoclopramide hydrochloride ($C_{14}H_{22}ClN_3O_2 \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197)
 [NOTE—Methods described in *Infrared Absorption* (197K), (197M), or (197A) may be used.]
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191)
Sample solution: Dissolve 100 mg in 2 mL of water, and acidify the solution with dilute nitric acid.
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Sample: 250 mg
Analysis: Dissolve the *Sample* in a mixture of 5.0 mL of 0.01 N hydrochloric acid and 50 mL of alcohol. Titrate with 0.1 N sodium hydroxide VS (see *Titrimetry* (541)), determining the endpoint potentiometrically. Read the volume of 0.1 N sodium hydroxide added between the two points of inflection. Each mL of 0.1 N sodium hydroxide is equivalent to 33.63 mg of the anhydrous metoclopramide hydrochloride ($C_{14}H_{22}ClN_3O_2 \cdot HCl$).
Acceptance criteria: 98.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **ORGANIC IMPURITIES**
Buffer: Dissolve 6.8 g of monobasic potassium phosphate in 700 mL of water. Add 0.2 mL of *N,N*-dimethyloctylamine, and adjust with dilute phosphoric acid to a pH of 4.0. Dilute with water to 1000 mL.
Mobile phase: Acetonitrile and *Buffer* (250:1000)
Standard stock solution: 0.1 mg/mL each of USP Metoclopramide Hydrochloride RS, USP Metoclopramide Related Compound A RS, USP Metoclopramide Related Compound B RS, and USP Metoclopramide Related Compound D RS in *Mobile phase*
Standard solution: 2.0 µg/mL each of USP Metoclopramide Hydrochloride RS, USP Metoclopramide Related Compound A RS, USP Metoclopramide Related Compound B RS, and USP Metoclopramide Related Compound D RS in *Mobile phase* from the *Standard stock solution*

Sample solution: 1.0 mg/mL of Metoclopramide Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Run time: At least 8 times the retention time of the metoclopramide peak

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 3.0 for metoclopramide related compound A and metoclopramide

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of each of metoclopramide related compounds A, B, and D in the portion of Metoclopramide Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the relevant metoclopramide related compound from the *Sample solution*
 r_S = peak response of the relevant metoclopramide related compound from the *Standard solution*
 C_S = concentration of the relevant USP Metoclopramide Related Compound RS in the *Standard solution* (mg/mL)
 C_U = concentration of Metoclopramide Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Metoclopramide Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual impurity from the *Sample solution*
 r_S = peak response of metoclopramide from the *Standard solution*
 C_S = concentration of USP Metoclopramide Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = concentration of Metoclopramide Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
N-Acetylmeclopramide (meclopramide related compound A) ^a	0.8	0.15
Metoclopramide	1.0	—
Methyl 4-acetamido-2-methoxybenzoate (meclopramide related compound D)	2.4–2.7	0.15

Metoclopramide Injection

DEFINITION

Metoclopramide Injection is a sterile solution of Metoclopramide Hydrochloride in Water for Injection. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of metoclopramide (C₁₄H₂₂ClN₃O₂).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Dissolve 2.7 g of sodium acetate in 500 mL of water. Add 500 mL of acetonitrile and 2 mL of tetramethylammonium hydroxide solution in methanol (1 in 5), and mix. Adjust with glacial acetic acid to a pH of 6.5, filter, and degas.

System suitability stock solution: Transfer 12.5 mg of benzenesulfonamide to a 25-mL volumetric flask. Add 15 mL of methanol, and shake to dissolve. Dilute with 0.01 M phosphoric acid to volume.

Standard stock solution: 0.9 mg/mL of USP Metoclopramide Hydrochloride RS in 0.01 M phosphoric acid

System suitability solution: Transfer 5 mL of *System suitability stock solution* and 5 mL of *Standard stock solution* into a 100-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume.

Standard solution: 45 µg/mL of USP Metoclopramide Hydrochloride RS (equivalent to 40 µg/mL of metoclopramide) from *Standard stock solution*. Dilute with 0.01 M phosphoric acid.

Sample solution: Nominally 40 µg/mL of metoclopramide, prepared as follows. Transfer a volume of *Injection*, equivalent to about 40 mg of metoclopramide, to a 100-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm or diode array. [NOTE—Use the diode array detector to perform *Identification test B*.]

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

[NOTE—The relative retention times for benzenesulfonamide and metoclopramide are 0.7 and 1.0, respectively.]

Resolution: NLT 1.5 between the benzenesulfonamide and metoclopramide peaks, *System suitability solution*

Tailing factor: NMT 2.0 for the metoclopramide peak, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metoclopramide (C₁₄H₂₂ClN₃O₂) in the portion of *Injection* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Metoclopramide Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metoclopramide in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of metoclopramide, 299.80

M_{r2} = molecular weight of anhydrous metoclopramide hydrochloride, 336.26

Acceptance criteria: 90.0%–110.0%

IMPURITIES

ORGANIC IMPURITIES

Mobile phase: Prepare a 1.88 g/L solution of sodium 1-hexanesulfonate solution (0.01 M solution) in a mixture of acetonitrile and water (60:40), and adjust with glacial acetic acid to a pH of 4.0.

Standard solution: 5.5 µg/mL of USP Metoclopramide Hydrochloride RS in *Mobile phase*

Sample solution: Dilute a volume of *Injection* with *Mobile phase* to obtain a solution containing about 1.0 mg/mL of metoclopramide.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 265 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Flow rate:** 2 mL/min**Injection volume:** 20 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 1.8**Relative standard deviation:** NMT 5.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

 r_U = peak response of each impurity from the *Sample solution* r_S = peak response of metoclopramide from the *Standard solution* C_S = concentration of USP Metoclopramide Hydrochloride RS in the *Standard solution* (μg/mL) C_U = nominal concentration of metoclopramide in the *Sample solution* (μg/mL) M_{r1} = molecular weight of metoclopramide, 299.80 M_{r2} = molecular weight of anhydrous metoclopramide hydrochloride, 336.26**Acceptance criteria:** NMT 0.5% of any individual impurity is found.**SPECIFIC TESTS**

- pH** (791): 2.5–6.5
- BACTERIAL ENDOTOXINS TEST** (85): NMT 2.5 USP Endotoxin Units/mg of metoclopramide
- PARTICULATE MATTER IN INJECTIONS** (788): It meets the requirements for small-volume injections.
- OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light. [NOTE—Injection containing an antioxidant agent does not require protection from light.] Store at controlled room temperature.
- USP REFERENCE STANDARDS** (11)
 - USP Endotoxin RS
 - USP Metoclopramide Hydrochloride RS

Metoclopramide Oral Solution**DEFINITION**Metoclopramide Oral Solution contains an amount of metoclopramide hydrochloride ($C_{14}H_{22}ClN_3O_2 \cdot HCl \cdot H_2O$) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of metoclopramide ($C_{14}H_{22}ClN_3O_2$).**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**PROCEDURE****Mobile phase:** Dissolve 2.7 g of sodium acetate in 600 mL of water, and add 400 mL of acetonitrile and 4 mL of tetramethylammonium hydroxide solution in methanol (25%). Adjust with glacial acetic acid to a pH of 6.5, filter, and degas.**System suitability stock solution:** Transfer 125 mg of benzenesulfonamide to a 25-mL volumetric flask. Add 15 mL of methanol, and shake to dissolve. Dilute with 0.01 M phosphoric acid to volume.**Standard stock solution:** 9 mg/mL of USP

Metoclopramide Hydrochloride RS in 0.01 M phosphoric acid

System suitability solution: Transfer 15 mL of *System suitability stock solution* and 5 mL of *Standard stock solution* into a 250-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume.**Standard solution:** 180 μg/mL of USP Metoclopramide Hydrochloride RS (equivalent to 160 μg/mL of metoclopramide) from *Standard stock solution*. Dilute with 0.01 M phosphoric acid.**Sample solution:** Nominally 160 μg/mL of metoclopramide, prepared as follows. Transfer a volume of Oral Solution, equivalent to about 4 mg of metoclopramide, to a 25-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 215 nm or diode array. Acceptance criteria: NMT 0.5% of any individual impurity is found. Disregard any peak with a relative retention time of 0.5 or less.

SPECIFIC TESTS

- **pH** (791): 2.0–5.5

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature. Protect from freezing.

- **USP REFERENCE STANDARDS** (11)

USP Metoclopramide Hydrochloride RS

Metoclopramide Tablets

DEFINITION

Metoclopramide Tablets contain an amount of metoclopramide hydrochloride ($C_{14}H_{22}ClN_3O_2 \cdot HCl \cdot H_2O$) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of metoclopramide ($C_{14}H_{22}ClN_3O_2$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: Dissolve 2.7 g of sodium acetate in 500 mL of water. Add 500 mL of acetonitrile and 2 mL of tetramethylammonium hydroxide solution in methanol (1 in 5), and mix. Adjust with glacial acetic acid to a pH of 6.5, filter, and degas.

System suitability stock solution: Transfer 12.5 mg of benzenesulfonamide to a 25-mL volumetric flask. Add 15 mL of methanol, and shake to dissolve. Dilute with 0.01 M phosphoric acid to volume.

Standard stock solution: 0.9 mg/mL of USP Metoclopramide Hydrochloride RS in 0.01 M phosphoric acid

System suitability solution: Transfer 5 mL of *System suitability stock solution* and 5 mL of *Standard stock solution* into a 100-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume.

Standard solution: 45 µg/mL of USP Metoclopramide Hydrochloride RS (equivalent to 40 µg/mL of metoclopramide) from *Standard stock solution* diluted with 0.01 M phosphoric acid

Sample solution: Nominally 40 µg/mL of metoclopramide, prepared as follows. Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of metoclopramide, to a 100-mL volumetric flask, add about 70 mL of 0.01 M phosphoric acid, and sonicate for 5 min. Cool to room temperature, dilute with 0.01 M phosphoric acid to volume, and mix. Pass the solution through a filter of 0.45-µm pore size, discarding the first portion of the filtrate. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with 0.01 M phosphoric acid to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm or diode array. [NOTE—Use the diode array detector to perform *Identification test B*.]

USP Metolazone RS

Metolazone Compounded Oral Suspension

DEFINITION

Metolazone Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of metolazone ($\text{C}_{16}\text{H}_{16}\text{ClN}_3\text{O}_3\text{S}$).

Prepare Metolazone Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Metolazone	100 mg
Vehicle: a 1:1 mixture of Vehicle for Oral Solution, (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Place the required number of tablets in a suitable mortar and comminute to a fine powder, or use *Metolazone* powder. Add 20 mL of *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions, and transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add *Vehicle* in portions to rinse the mortar, then add sufficient *Vehicle* to bring to final volume, and mix well.

ASSAY• **PROCEDURE**

Mobile phase: Methanol and water (70:30) containing 1.5 g/L of ammonium acetate and 1 mL/L of diisopropylamine. Filter, and degas.

Standard solution: 1.0 $\mu\text{g/mL}$ of USP Metolazone RS

Sample solution: Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 1.0 mL of the sample to a 1000-mL volumetric flask, and dilute with *Mobile phase* to volume.

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: System suitability solution and Standard solution

Suitability requirements

Resolution: NLT 1.5 between metoprolol related compound A and metoprolol related compound B; NLT 2.5 between metoprolol related compound B and metoprolol related compound C, System suitability solution

Relative standard deviation: NMT 2.0% for metoprolol, metoprolol related compound A, metoprolol related compound B, metoprolol related compound C, and metoprolol related compound D, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the corresponding metoprolol related compound in the portion of Metoprolol Fumarate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the corresponding metoprolol related compound in the *Sample solution*

r_S = peak response of the corresponding metoprolol related compound in the *Standard solution*

C_S = concentration of the corresponding USP Metoprolol Related Compound RS in the *Standard solution* (µg/mL)

C_U = concentration of Metoprolol Fumarate in the *Sample solution* (µg/mL)

Calculate the percentage of any unspecified impurity in the portion of Metoprolol Fumarate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified impurity in the *Sample solution*

r_S = peak response of metoprolol in the *Standard solution*

C_S = concentration of USP Metoprolol Fumarate RS in the *Standard solution* (µg/mL)

C_U = concentration of Metoprolol Fumarate in the *Sample solution* (µg/mL)

Acceptance criteria: See Table 2. Disregard peaks below 0.03%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Related compounds—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Dissolve an accurately weighed quantity of Metoprolol Succinate in methanol to obtain a solution containing 50 mg per mL.

Standard solution—Dilute the *Test solution* quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of 0.1 mg per mL.

Application volume: 10 µL.

Developing solvent system: a mixture of ethyl acetate and methanol (80:20).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Place two 50-mL beakers, each containing 30 mL of ammonium hydroxide, on the bottom of a chromatographic chamber that is lined with filter paper and contains the *Developing solvent system*, and allow to equilibrate for 1 hour. Position the plate in the chromatographic chamber, and develop the chromatogram until the solvent front has moved about two-thirds of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry the plate for 3 hours in a current of warm air. Place the plate in a chamber containing iodine vapor, and allow to react for at least 15 hours. Compare the intensities of the brown spots appearing on the chromatogram: any secondary spot obtained from the *Test solution* is not more intense than the corresponding spot obtained from the *Standard solution*. Not more than 0.2% is found.

TEST 2—

Sodium dodecyl sulfate solution, Mobile phase, and Resolution solution—Prepare as directed in the *Assay*.

Standard solution—Dissolve an accurately weighed quantity of USP Metoprolol Succinate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0 µg per mL.

Test solution—Transfer about 50 mg of Metoprolol Succinate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between metoprolol related compound A and metoprolol related compound B is not less

than 2.5; and the resolution, R , between metoprolol related compound B and metoprolol related compound C is not less than 1.5. [NOTE—The relative retention times are about 0.6 for metoprolol related compound C, 0.7 for metoprolol related compound B, 0.8 for metoprolol related compound A, 1.0 for metoprolol, and 5.0 and 5.2 for the two diastereomers of metoprolol related compound D.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Metoprolol Succinate taken by the formula:

$$100(C_5 / C_1)(r_1 / r_3)$$

in which C_5 is the concentration, in mg per mL, of USP Metoprolol Succinate RS in the *Standard solution*; C_1 is the concentration of metoprolol succinate in the *Test solution*; r_1 is the individual peak response of related impurities; and r_3 is the peak response obtained from the *Standard solution*: not more than 0.1% of any single impurity is found, and not more than 0.5% of total impurities is found. [NOTE—The sum of the peak responses for the two diastereomers of metoprolol related compound D is used in the above calculation to report the amount of metoprolol related compound D.]

Assay—

Sodium dodecyl sulfate solution—Add 1.3 g of sodium dodecyl sulfate to 1 L of aqueous phosphoric acid, 0.1% (w/v).

Mobile phase—Prepare a filtered and degassed mixture of Sodium dodecyl sulfate solution and acetonitrile (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Prepare a solution in *Mobile phase* containing about 5 μ g each of USP Metoprolol Succinate RS, USP Metoprolol Related Compound A RS, USP Metoprolol Related Compound B RS, USP Metoprolol Related Compound C RS, and USP Metoprolol Related Compound D RS per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Metoprolol Succinate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.08 mg per mL.

Test preparation—Transfer about 80 mg of Metoprolol Succinate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 223-nm detector and a 4-mm \times 12.5-cm column that contains 4- μ m packing L7. The column temperature is maintained at 30°. The flow rate is about 0.9 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between metoprolol related compound A and metoprolol related compound B is not less than 2.5; and the resolution, R , between metoprolol related compound B and metoprolol related compound C is not less than 1.5. [NOTE—The relative retention times are about 0.6 for metoprolol related compound C, 0.7 for metoprolol related compound B, 0.8 for metoprolol related compound A, 1.0 for metoprolol, and 5.0 and 5.2 for the two diastereomers of metoprolol related compound D.] Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Test preparation* into the chro-

matograph, record the chromatograms for at least 1.5 times the retention of the metoprolol peak, and measure the peak responses. Calculate the quantity, in mg, of $(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4$ in the portion of Metoprolol Succinate taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Metoprolol Succinate RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.

Metoprolol Succinate Extended-Release Tablets

DEFINITION

Metoprolol Succinate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample solution: Equivalent to 200 mg of metoprolol succinate from 1 or more Tablets to a stoppered centrifuge tube. Add 40 mL of pH 6.8 Phosphate Buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*) and 40 mL of methylene chloride, and shake for 5 min. Centrifuge, filter, and use the aqueous phase as the *Sample solution*.

Sample: Transfer 3 mL of the *Sample solution* to a separator. Add 2 mL of ammonium hydroxide, and extract with 20 mL of methylene chloride. Filter the methylene chloride phase. Grind 1 mL of the filtrate with 300 mg of potassium bromide, dry in a current of warm air, and prepare a disk.

Acceptance criteria: The IR spectrum of the *Sample* exhibits maxima only at the same wavelengths as that obtained from a similar preparation of USP Metoprolol Succinate RS (presence of metoprolol).

• B. INFRARED ABSORPTION (197K)

Sample: Transfer 5 mL of the *Sample solution* prepared in *Identification* test A into a glass-stoppered test tube. Add 2 mL of 5 N hydrochloric acid, and extract with 5 mL of ether. Filter the ether phase. Grind 2 mL of the filtrate with 300 mg of potassium bromide, dry in a current of warm air, and prepare a disk.

Acceptance criteria: The IR spectrum of the *Sample* exhibits maxima only at the same wavelengths as that obtained from a similar preparation of succinic acid (presence of succinate).

ASSAY

• PROCEDURE

Analysis: Determine the mean percentage value of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ from the Tablets analyzed in the test for *Uniformity of Dosage Units* (905).

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: pH 6.8 Phosphate Buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 500 mL

Apparatus 2: 50 rpm

Times: 1, 4, 8, and 20 h

Buffer, Mobile phase, and Standard solution: Proceed as directed in the test for *Uniformity of Dosage Units* (905).

Analysis: Proceed as directed in the test for *Uniformity of Dosage Units* (905), except use 5.0 mL of a filtered

portion of the solution under test as the *Sample solution*, and use *Medium* as the blank, in comparison with a *Standard solution* having a known concentration of USP Metoprolol Succinate RS in the same *Medium*.
Acceptance criteria: See Table 1.

Table 1

Time (h)	Amount Dissolved (%)
1	NMT 25
4	20–40
8	40–60
20	NLT 80

The percentages of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Simulated gastric fluid without enzyme, pH 1.2; 500 mL

Apparatus 2: 75 rpm

Time: 1, 4, 8, and 20 h

Buffer: 1 M monobasic sodium phosphate, 1 M phosphoric acid, and water (50:8:942). If necessary, adjust with 1 M monobasic sodium phosphate or 1 M phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (250:750)

Standard solution: Prepare a solution of USP Metoprolol Succinate RS in *Medium* as directed in *Table 2*.

Table 2

Tablet Strength (mg as metoprolol succinate)	Concentration (mg/mL)
200	0.380
100	0.190
50	0.095
25	0.048

Sample solution: Pass the solution under test through a suitable filter.

Chromatographic system
 (See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.0-mm \times 12.5-cm; 4- μ m packing L7

Flow rate: 1 mL/min

Injection volume: See *Table 3*.

Table 3

Tablet Strength (mg as metoprolol succinate)	Volume (μ L)
25	40
50	20
100	10
200	5

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis:

Samples: *Standard solution* and *Sample solution*

Calculate the concentration, C_i , in mg/mL, of metoprolol succinate dissolved in *Medium* at each time point, i :

$$\text{Result} = (r_u/r_s) \times C_s$$

r_u = peak response of metoprolol from the *Sample solution*

r_s = peak response of metoprolol from the *Standard solution*

C_s = concentration of USP Metoprolol Succinate RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ dissolved (Q_i), at each time point i :

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_5)] + [C_1 \times V_5]\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times (V - (2 \times V_5))] + [(C_2 + C_1) \times V_5]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times (V - (3 \times V_5))] + [(C_3 + C_2 + C_1) \times V_5]\} \times (1/L) \times 100$$

C_i = concentration of metoprolol succinate in the portion of sample withdrawn at time point i (mg/mL)

V = volume of *Medium*; 500 mL

V_5 = volume of the *Sample solution* withdrawn from the *Medium* (mL)

L = label claim (mg/Tablet)

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (hr)	Amount Dissolved (%)
1	1	NMT 20
2	4	20–40
3	8	55–85
4	20	NLT 80

The percentages of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

Procedure for content uniformity

Buffer: Mix 50 mL of 1 M monobasic sodium phosphate and 8.0 mL of 1 M phosphoric acid, and dilute with water to 1000 mL. If necessary, adjust with 1 M monobasic potassium phosphate or 1 M phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (250:750)

Standard solution: 0.05 mg/mL of USP Metoprolol Succinate RS in *Mobile phase*

Sample stock solution: Nominally 1 mg/mL of metoprolol succinate prepared as follows. Transfer 1 Tablet to a suitable volumetric flask, add about 5 mL of water, and allow the Tablet to disintegrate. Add a vol-

ume of alcohol to fill 30% of final volume, and shake for 30 min. Add a portion of 0.1 N hydrochloric acid to fill 50% of the flask volume, and shake for an additional 30 min. Dilute with 0.1 N hydrochloric acid to volume. Filter, and discard the first 10 mL of the filtrate.

Sample solution: Nominally 0.05 mg/mL of metoprolol succinate from the *Sample stock solution* in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4-mm × 12.5-cm; packing L7

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ in the Tablet taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of metoprolol from the *Sample solution*

r_s = peak response of metoprolol from the *Standard solution*

C_s = concentration of USP Metoprolol Succinate RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of metoprolol succinate in the *Sample solution* (mg/mL)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label it to indicate the content of metoprolol succinate and its equivalent, expressed as metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
USP Metoprolol Succinate RS

Metoprolol Tartrate

$(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$ 684.81

2-Propanol, 1-[4-(2-methoxyethyl)phenoxy]-3-[(1-methylethyl)amino]-, (±)-, [R-(R*,R*)]-2,3-dihydroxybutanedioate (2:1) (salt);
(±)-1-(Isopropylamino)-3-[p-(2-methoxyethyl)phenoxy]-2-propanol 1-(+)-tartrate (2:1) (salt);
1-(Isopropylamino)-3-[p-(2-methoxyethyl)phenoxy]-2-propanol (2:1) *dextro*-tartrate salt [56392-17-7].

DEFINITION

Metoprolol Tartrate contains NLT 98.0% and NMT 102.0% of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Analysis

Samples: *Standard solution* and *Sample solution*.

Calculate the percentage of each impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each individual impurity in the *Sample solution*
 r_S = peak response of the corresponding metoprolol related compound or metoprolol (for calculating any individual unspecified impurity) in the *Standard solution*
 C_S = concentration of the corresponding USP Metoprolol Related Compound RS or USP Metoprolol Tartrate RS (for calculating any individual unspecified impurity) in the *Standard solution* (mg/mL)
 C_U = concentration of Metoprolol Tartrate in the *Sample solution* (mg/mL)
Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Metoprolol related compound C ^a	0.65	0.10
Metoprolol related compound B ^b	0.72	0.10
Metoprolol related compound A ^c	0.83	0.10
Metoprolol	1.00	—
Metoprolol related compound D ^{d,e}	4.78/5.00	0.10
Any individual unspecified impurity	—	0.10
Total impurities ^f	—	0.50

^a (±)-4-[2-Hydroxy-3-(1-isopropyl)aminopropoxy]benzaldehyde.

^b (±)-1-Chloro-2-hydroxy-3-[4-(2-methoxyethyl)phenoxy]-propane.

^c (±)-1-(Ethylamino)-3-[4-(2-methoxyethyl)phenoxy]-propan-2-ol.

^d (±)-N,N-bis-[2-Hydroxy-3-[4-(2-methoxyethyl)phenoxy]propyl](1-methylethyl)amine hydrochloride.

^e The sum of the peak responses of the two diastereomers is used to calculate the amount of metoprolol related compound D.

^f Disregard any peak due to tartaric acid at about RRT 0.17.

SPECIFIC TESTS

• OPTICAL ROTATION, *Specific Rotation* (7815)

Sample solution: 20 mg/mL in water

Acceptance criteria: +6.5° to +10.5° (t = 20°)

• pH (791)

Sample solution: 100 mg/mL of Metoprolol Tartrate in water

Acceptance criteria: 6.0–7.0

• LOSS ON DRYING (731)

Sample solution: Dry a sample in a vacuum at 60° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Metoprolol Tartrate RS

USP Metoprolol Related Compound A RS

(±)-1-(Ethylamino)-3-[4-(2-methoxyethyl)phenoxy]-propan-2-ol.

Metoprolol Tartrate Injection

» Metoprolol Tartrate Injection is a sterile solution of Metoprolol Tartrate in Water for Injection. It contains Sodium Chloride as a tonicity-adjusting agent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metoprolol tartrate [(C₁₅H₂₅NO₃)₂ · C₄H₆O₆].

Packaging and storage—Preserve in single-dose, light-resistant containers, preferably of Type I or Type II glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Metoprolol Tartrate RS

USP Oxprenolol Hydrochloride RS

Identification—Place a volume of Injection, equivalent to about 40 mg of metoprolol tartrate, in a separator, add 4 mL of dilute ammonium hydroxide (1 in 3), and extract with 20 mL of chloroform, filtering the chloroform extract through chloroform-pre-rinsed anhydrous sodium sulfate. Evaporate the chloroform to dryness, and place in a freezer to congeal the residue: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Metoprolol Tartrate RS.

Bacterial Endotoxins Test (85)—It contains not more than 25.0 USP Endotoxin Units per mg of metoprolol tartrate.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

pH (791): between 5.0 and 8.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare a degassed solution by dissolving 961 mg of 1-pentanesulfonic acid sodium salt (monohydrate) and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol and 470 mL of water and adding 0.57 mL of glacial acetic acid.

Internal standard solution—Dissolve USP Oxprenolol Hydrochloride RS in freshly prepared *Mobile phase* to obtain a solution containing about 720 µg per mL.

Sodium chloride solution—Dissolve 9.0 g of sodium chloride in water to make 1000 mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Metoprolol Tartrate RS in *Sodium chloride solution* to obtain a stock solution having a known concentration of about 1000 µg per mL. Mix equal volumes, accurately measured, of this stock solution and of *Internal standard solution*.

Assay preparation—Dilute an accurately measured volume of Injection, if necessary, quantitatively with *Sodium chloride solution* to obtain a stock solution having a concentration of about 1000 µg per mL. Mix equal volumes, accurately measured, of this stock solution and of *Internal standard solution*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*; the relative standard deviation is not more than 2.0%, and the resolution factor between metoprolol tartrate and oxprenolol hydrochloride is not less than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.8 for metoprolol tartrate and 1.0 for oxprenolol hydrochloride. Calculate the quantity, in mg, of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$ in each mL of the Injection taken by the formula:

$$(L/D)(C)(R_U/R_S)$$

in which *L* is the labeled quantity, in mg, of metoprolol tartrate in the Injection; *D* is the concentration, in µg per mL, of metoprolol tartrate in the *Assay preparation*, on the basis of the labeled quantity in each mL of Injection taken and the extent of dilution; *C* is the concentration, in µg per mL, of USP Metoprolol Tartrate RS in the *Standard preparation*; and *R_U* and *R_S* are the peak response ratios of metoprolol tartrate to oxprenolol hydrochloride obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Metoprolol Tartrate Compounded Oral Solution

DEFINITION

Metoprolol Tartrate Compounded Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$.

Prepare Metoprolol Tartrate Compounded Oral Solution 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Metoprolol Tartrate powder	1 g
Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , a sufficient quantity to make	100 mL

Add *Metoprolol Tartrate powder* and 20 mL of *Vehicle* to a mortar, and mix. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix well.

ASSAY

PROCEDURE

Mobile phase: 961 mg of 1-pentanesulfonic acid sodium salt (monohydrate) and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol and 470 mL of water. Add 0.57 mL of glacial acetic acid. Filter, and degas.

Standard solution: 100 µg/mL of USP Metoprolol Tartrate RS

Sample solution: Agitate the container of Oral Solution for 30 min on a rotating mixer, remove a 5-mL sample,

and store in a clear glass vial at −70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 1.0 mL of the sample to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for metoprolol tartrate is about 7.3 min.]

Suitability requirements

Relative standard deviation: NMT 1.3% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$ in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Metoprolol Tartrate RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of metoprolol tartrate in the *Sample solution* (µg/mL)
Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **PH (791):** 3.6–4.6

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or in a refrigerator.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded when stored at controlled room temperature or in a refrigerator
- **LABELING:** Label it to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**
USP Metoprolol Tartrate RS

Metoprolol Tartrate Compounded Oral Suspension

DEFINITION

Metoprolol Tartrate Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$.

Prepare Metoprolol Tartrate Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Metoprolol Tartrate	1 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution, (regular or sugar-free), <i>NF</i> , and Vehicle for Oral Suspension, <i>NF</i> , a sufficient quantity to make	100 mL

Place the required number of tablets in a suitable mortar, and comminute to a fine powder, or use *Metoprolol Tartrate powder*. Add the *Vehicle* in small portions, and mix

well. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the *Vehicle* in portions to rinse the mortar. Add sufficient *Vehicle* to bring to final volume, and mix well.

ASSAY

PROCEDURE

Mobile phase: 961 mg of 1-pentanesulfonic acid sodium salt (monohydrate) and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol and 470 mL of water. Add 0.57 mL of glacial acetic acid. Filter, and degas.

Standard solution: 100 µg/mL of USP Metoprolol Tartrate RS

Sample solution: Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at -70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of the sample to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for metoprolol tartrate is about 7.3 min.]

Suitability requirements

Relative standard deviation: NMT 1.3% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metoprolol tartrate [(C₁₅H₂₅NO₃)₂ · C₄H₆O₆] in the portion of Oral Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Metoprolol Tartrate RS in the *Standard solution* (µg/mL)

C_u = nominal concentration of metoprolol tartrate in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **PH** (791): 3.6–4.6

ADDITIONAL REQUIREMENTS

USP Metoprolol Tartrate RS

Metoprolol Tartrate Tablets

» Metoprolol Tartrate Tablets contain not less than 90.0 percent and not more than 110.0 per-

cent of the labeled amount of metoprolol tartrate [(C₁₅H₂₅NO₃)₂ · C₄H₆O₆].

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Metoprolol Tartrate RS

USP Oxprenolol Hydrochloride RS

Identification—

A: Place a quantity of finely powdered Tablets, equivalent to about 40 mg of metoprolol tartrate, in a separator, add 25 mL of water and 4 mL of dilute ammonium hydroxide (1 in 3), and extract with 20 mL of chloroform, filtering the chloroform extract through chloroform-pretreated anhydrous sodium sulfate. Evaporate the chloroform to dryness, and place in a freezer to congeal the residue: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Metoprolol Tartrate RS.

B: Transfer a portion of finely powdered Tablets, equivalent to about 50 mg of metoprolol tartrate, to a 500-mL volumetric flask, dilute with water to volume, and mix. Pass a portion of this solution through a filter of 1 µm or finer porosity: the UV spectrum of the filtrate exhibits maxima and minima at the same wavelengths as that of a solution of USP Metoprolol Tartrate RS in water having a concentration of about 0.1 mg per mL.

C: The retention time of the metoprolol peak in the chromatogram obtained from the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

Dissolution (711)—

Medium: simulated gastric fluid TS (without enzyme); 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of (C₁₅H₂₅NO₃)₂ · C₄H₆O₆ dissolved in filtered portions of the solution under test from UV absorbances at the wavelength of maximum absorbance at about 275 nm in comparison with a *Standard solution* having a known concentration of USP Metoprolol Tartrate RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of (C₁₅H₂₅NO₃)₂ · C₄H₆O₆ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Solvent mixture—Prepare a mixture of methanol and 0.1 N hydrochloric acid (1:1).

Mobile phase—Prepare a suitable and degassed solution by dissolving 961 mg of 1-pentanesulfonic acid sodium salt (monohydrate) and 82 mg of anhydrous sodium acetate in a mixture of 550 mL of methanol and 470 mL of water and adding 0.57 mL of glacial acetic acid.

Standard preparation—Dissolve an accurately weighed quantity of USP Metoprolol Tartrate RS in *Solvent mixture* to obtain a stock solution having a known concentration of about 1000 µg per mL. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Resolution solution—Prepare a solution of oxprenolol hydrochloride in *Solvent mixture* to obtain a solution containing about 720 µg per mL. Prepare a 1:1 mixture of this solution and the stock solution used to prepare the *Standard preparation*.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of metoprolol tartrate, to a 50-mL volumetric flask, add 30 mL of *Solvent mix-*

ture, shake by mechanical means for 30 minutes, sonicate for 15 minutes, and heat on a steam bath for 10 minutes. Allow the solution to cool to room temperature, dilute with *Solvent mixture* to volume, and mix. Centrifuge a portion of the solution, and transfer 25.0 mL of the supernatant to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter of 0.5 μm or finer porosity, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.8 for metoprolol and 1.0 for oxprenolol, and the resolution, R , between the metoprolol and oxprenolol peaks is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 30 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metoprolol tartrate $[(\text{C}_{15}\text{H}_{25}\text{NO}_3)_2 \cdot \text{C}_4\text{H}_6\text{O}_6]$ in the portion of Tablets taken by the formula:

$$0.1C(r_u / r_s)$$

in which C is the concentration, in μg per mL, of USP Metoprolol Tartrate RS in the *Standard preparation*; and r_u and r_s are the metoprolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Metoprolol Tartrate and Hydrochlorothiazide Tablets

» Metoprolol Tartrate and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of metoprolol tartrate $[(\text{C}_{15}\text{H}_{25}\text{NO}_3)_2 \cdot \text{C}_4\text{H}_6\text{O}_6]$ and hydrochlorothiazide $(\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2)$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Benzothiadiazine Related Compound A RS
4-Amino-6-chloro-1,3-benzenedisulfonamide.
 $\text{C}_6\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$ 285.73
USP Hydrochlorothiazide RS
USP Metoprolol Tartrate RS
USP Oxprenolol Hydrochloride RS

Identification—

A: Place a quantity of finely powdered Tablets, equivalent to about 100 mg of metoprolol tartrate, in a 50-mL volumetric flask. Add about 30 mL of 0.1 N sodium hydroxide, shake for 20 minutes, dilute with 0.1 N sodium hydroxide to volume, and mix. Filter a portion of this mixture, discarding the first 10 mL of the filtrate. Place 25 mL of the filtrate into a separator, and extract with three 15-mL portions of chloroform, filtering the chloroform extracts through chloroform-prerinsed anhydrous sodium sulfate, and combining the extracts in a suitable container. [NOTE—Retain the aqueous layer remaining after extraction for *Identification test B.*] Evaporate the chloroform to dryness, and place in a freezer to congeal the residue: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained ex-

hibits maxima only at the same wavelengths as that of a similar preparation of USP Metoprolol Tartrate RS.

B: Pass the aqueous layer from *Identification test A* through 0.1 N sodium hydroxide-prerinsed cotton. Dilute a portion of the filtrate quantitatively and stepwise with 0.1 N sodium hydroxide to obtain a solution having a concentration of about 0.01 mg of hydrochlorothiazide per mL: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as a Standard solution prepared as follows. Dissolve 25 mg of USP Hydrochlorothiazide RS in 50 mL of 0.1 N sodium hydroxide in a separator, and extract with three 15-mL portions of chloroform. Discard the chloroform extracts, and pass the aqueous solution through 0.1 N sodium hydroxide-prerinsed cotton. Pipet 2 mL of the filtrate into a 100-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

Dissolution (711)—

Medium: simulated gastric fluid TS (without enzyme); 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Determination of dissolved metoprolol tartrate—Remove about 125 mL of the solution under test, allow to cool to room temperature, and filter, discarding the first 25 mL of the filtrate. [NOTE—Retain about 30 mL of the remaining filtrate of the solution under test for the *Determination of dissolved hydrochlorothiazide*.] If necessary, quantitatively dilute a portion of the filtrate with fresh *Dissolution Medium* to obtain a solution having a concentration of about 0.05 mg of metoprolol tartrate per mL. Transfer to separate separators 50.0 mL of the filtrate, 50.0 mL of a Standard solution in *Dissolution Medium* having a known concentration of about 0.05 mg of USP Metoprolol Tartrate RS per mL, and 50.0 mL of *Dissolution Medium* to provide the blank. Add 10 mL of 2.5 N sodium hydroxide to each separator, and extract each with three 15-mL portions of chloroform, filtering the chloroform extracts through pledgets of chloroform-prerinsed glass wool into individual 50-mL volumetric flasks. Dilute the contents of each flask with chloroform to volume, and mix. Determine the absorbances of the solutions from the filtrate and the Standard solution in 2-cm cells at the wavelength of maximum absorbance at about 276 nm, with a suitable spectrophotometer, using the solution from the blank to set the instrument. Calculate the quantity, in mg, of $(\text{C}_{15}\text{H}_{25}\text{NO}_3)_2 \cdot \text{C}_4\text{H}_6\text{O}_6$ dissolved by the formula:

$$900Cf(A_u / A_s)$$

in which C is the concentration, in mg per mL, of USP Metoprolol Tartrate RS in the *Standard solution*; f is the dilution factor for the solution from the filtrate; and A_u and A_s are the absorbances of the solution from the filtrate and of the *Standard solution*, respectively.

Determination of dissolved hydrochlorothiazide—Filter a portion of the filtrate retained from the *Determination of dissolved metoprolol tartrate* through a filter of 0.8 μm or finer porosity, discarding the first 5 mL of the filtrate. If necessary, quantitatively dilute a portion of the filtrate with fresh *Dissolution Medium* to obtain a solution having a concentration of about 0.03 mg of hydrochlorothiazide per mL. Prepare a *Standard solution* in *Dissolution Medium* having a known concentration of about 0.03 mg of USP Hydrochlorothiazide RS per mL. Determine the absorbances of these solutions in 2-cm cells at the wavelength of maximum absorbance at about 316 nm, using *Dissolution Medium* as the blank. Calculate the quantity, in mg, of $\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$ dissolved by the formula:

$$900Cf(A_u / A_s)$$

in which C is the concentration, in mg per mL, of USP Hydrochlorothiazide RS in the *Standard solution*; f is the dilu-

tion factor for the solution from the filtrate; and A_U and A_S are the absorbances of the solution from the filtrate and of the *Standard solution*, respectively.

Tolerances—Not less than 80% (Q) of the labeled amount of metoprolol tartrate ($C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$ and not less than 80% (Q) of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) are dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements for *Content Uniformity* with respect to metoprolol tartrate and to hydrochlorothiazide.

Procedure for content uniformity of metoprolol tartrate—Transfer 1 Tablet to a suitable volumetric flask, add 0.1 N hydrochloric acid to about 60% of the nominal volume, sonicate for 15 minutes, and shake by mechanical means for 30 minutes. Dilute with 0.1 N hydrochloric acid to volume to obtain a final solution having a concentration of approximately 1000 μ g per mL. Mix, and filter, discarding the first 20 mL of the filtrate. Pipet 10 mL of the filtrate, 10 mL of a *Standard solution* of USP Metoprolol Tartrate RS in the same medium having a known concentration of about 1000 μ g per mL, and 10 mL of 0.1 N hydrochloric acid to provide a blank into individual separators. To each separator add 2.0 mL of 2.5 N sodium hydroxide, and extract with three 25-mL portions of chloroform, passing the chloroform extracts through chloroform-pre-rinsed glass wool into individual 100-mL volumetric flasks. Dilute with chloroform to volume, and mix. Determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 276 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of ($C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$ in the Tablet by the formula:

$$(T/1000)(A_U / A_S)$$

in which T is the labeled quantity, in mg, of metoprolol tartrate in the Tablet; C is the concentration, in μ g per mL, of USP Metoprolol Tartrate RS in the *Standard solution*; and A_U and A_S are the absorbances of the solution from the Tablet and the *Standard solution*, respectively.

Procedure for content uniformity of hydrochlorothiazide—Transfer 1 Tablet to a 100-mL volumetric flask containing 15 mL of water, and shake by mechanical means for 15 minutes. Add 60 mL of methanol, sonicate for 5 minutes, and shake by mechanical means for 30 minutes. Dilute with methanol to volume, and mix. Centrifuge 40 mL of this suspension. Dilute an accurately measured portion of the supernatant quantitatively with methanol to obtain a solution having a concentration of about 0.05 mg of hydrochlorothiazide per mL. Filter a portion of this solution through a 0.5- μ m porosity filter, discarding the first few mL of the filtrate. Use the filtrate as the test solution. Transfer about 25 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 100-mL volumetric flask containing 15 mL of water, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix (*Standard solution*). Concomitantly determine the absorbances of the test solution and the *Standard solution* at the wavelength of maximum absorbance at about 316 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken by the formula:

$$(LC/D)(A_U / A_S)$$

in which L is the labeled quantity, in mg, of hydrochlorothiazide in the Tablet; C is the concentration, in mg per mL, of USP Hydrochlorothiazide RS in the *Standard solution*; D is the concentration, in mg per mL, of hydrochlorothiazide in the test solution based on the labeled quantity in the Tablet and the extent of dilution; and A_U and A_S are the absorbances of the *Test solution* and the *Standard solution*, respectively.

Diazotizable substances—

Standard solution—Weigh accurately 5 mg of USP Benzothiadiazine Related Compound A RS, and dissolve in 2 mL of methanol contained in a 50-mL volumetric flask. Dilute with water to volume, and mix. Pipet 5 mL of the resulting solution into a 100-mL volumetric flask, add 20 mL of methanol, dilute with water to volume, and mix. Each mL of *Standard solution* contains 5 μ g of the Reference Standard.

Test solution—Transfer a portion of the powdered Tablets prepared for the Assay, accurately weighed and equivalent to 50 mg of hydrochlorothiazide, to a 100-mL volumetric flask containing a mixture of 20 mL of methanol and 20 mL of water. Shake continuously for 5 to 10 minutes, dilute with water to volume, mix, and filter. Use the filtrate as the *Test solution* immediately after preparation.

Procedure—Pipet 5 mL each of the *Standard solution* and the *Test solution* into separate, 50-mL volumetric flasks. Pipet 5 mL of water into a third 50-mL volumetric flask to provide a blank. To each flask add 1 mL of freshly prepared sodium nitrite solution (1 in 100) and 5 mL of dilute hydrochloric acid (1 in 10), and allow to stand for 5 minutes. Add 2 mL of ammonium sulfamate solution (1 in 50), allow to stand for 5 minutes with frequent swirling, then add 2 mL of freshly prepared disodium chromotropate solution (1 in 100) and 10 mL of sodium acetate TS. Dilute with water to volume, and mix. Concomitantly determine the absorbances of the solutions obtained from the *Standard solution* and the *Test solution* at 500 nm, with a suitable spectrophotometer, against the blank. The absorbance of the solution from the *Test solution* does not exceed that of the solution from the *Standard solution*, corresponding to not more than 1.0% of diazotizable substances.

Assay for metoprolol tartrate—

Mobile phase and Chromatographic system—Proceed as directed in the Assay under *Metoprolol Tartrate Injection*.

Internal standard solution—Dissolve USP Oxprenolol Hydrochloride RS in freshly prepared *Mobile phase* to obtain a solution containing about 360 μ g per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Metoprolol Tartrate RS in 0.1 N hydrochloric acid to obtain a stock solution having a known concentration of about 1000 μ g per mL. Transfer 10.0 mL of this stock solution to a suitable separator, add 2.0 mL of 2.5 N sodium hydroxide, and extract with three 25-mL portions of chloroform. Pass the chloroform extracts through chloroform-pre-rinsed glass wool into a round-bottom flask, and evaporate on a rotary evaporator under vacuum to dryness. Add 20.0 mL of *Internal standard solution* to the flask, sonicate for 3 minutes, and gently swirl to dissolve the residue in the flask.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of metoprolol tartrate, to a 100-mL volumetric flask, add 60 mL of 0.1 N hydrochloric acid, heat on a steam bath for 3 minutes, and sonicate for 5 minutes. Shake for 30 minutes. Allow the solution to cool to room temperature, dilute with 0.1 N hydrochloric acid to volume, and mix. Filter a portion of this solution, discarding the first 20 mL of the filtrate. Transfer 10.0 mL of the filtrate to a separator, add 2.0 mL of 2.5 N sodium hydroxide, and extract with three 25-mL portions of chloroform. Pass the chloroform extracts through chloroform-pre-rinsed glass wool into a round-bottom flask, and evaporate on a rotary evaporator under vacuum to dryness. Add 20.0 mL of *Internal standard solution* to the flask, sonicate for 3 minutes, and gently swirl to dissolve the residue in the flask. Filter a portion of this solution through a filter of 0.5 μ m or finer porosity, discarding the first few mL of the filtrate. Use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Metoprolol Tartrate Injection*. Calculate the quantity, in

mg, of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$ in the portion of Tablets taken by the formula:

$$0.1 C(R_U / R_S)$$

in which C is the concentration, in μg per mL, of USP Metoprolol Tartrate RS in the stock solution used to prepare the *Standard preparation*; and R_U and R_S are the peak response ratios of metoprolol tartrate to oxprenolol hydrochloride obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for hydrochlorothiazide—

Mobile phase—[NOTE—Pass the methanol and water through 0.5- μm porosity filters before use.] Dissolve 1.38 g of monobasic sodium phosphate in 780 mL of water, add 220 mL of methanol, and mix. Degas before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Dissolve a quantity of sulfanilamide in methanol to obtain a solution containing about 0.4 mg per mL.

System suitability solution—Dissolve a quantity of USP Benzothiadiazine Related Compound A RS in *Internal standard solution* to obtain a solution containing about 1 mg per mL. Mix 1 mL of this solution and 4 mL of methanol.

Standard preparation—Transfer about 50 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg of hydrochlorothiazide, to a 50-mL volumetric flask. Add 10.0 mL of *Internal standard solution* and 20 mL of methanol, and sonicate for 5 minutes. Shake by mechanical means for 30 minutes, dilute with methanol to volume, and mix. Centrifuge a portion of this solution, and pass a portion of the supernatant through a 0.5- μm porosity filter, discarding the first few mL of the filtrate. Use the filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 0.6 mL per minute. Chromatograph replicate injections of the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for sulfanilamide and 1.0 for benzothiadiazine related compound A; and the resolution, R , between the peaks is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 4 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for sulfanilamide and 1.0 for hydrochlorothiazide. Calculate the quantity, in mg, of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Hydrochlorothiazide RS in the *Standard preparation*; and R_U and R_S are the peak response ratios of hydrochlorothiazide to sulfanilamide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Metrifonate

$C_4H_8Cl_3O_4P$ 257.44

Phosphonic acid, (2,2,2-trichloro-1-hydroxyethyl)-, dimethyl ester.

Dimethyl (2,2,2-trichloro-1-hydroxyethyl)phosphonate [52-68-6].

» Metrifonate contains not less than 98.0 percent and not more than 100.5 percent of $C_4H_8Cl_3O_4P$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers at a temperature not exceeding 25°.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Metrifonate RS

Trichlorfon.

Completeness of solution (641): meets the requirements, 0.5 g of it being dissolved in methanol.

Color of solution (631)—The solution obtained in the test for *Completeness of solution* has no more color than *Matching Fluid F*.

Identification—

A: Infrared Absorption (197K).

B: Thin-Layer Chromatographic Identification Test (201)—

Test solution: Dissolve 10 mg of Metrifonate in methanol, and dilute with methanol to 10.0 mL.

Developing solvent system: a mixture of toluene, dioxane, and glacial acetic acid (70:25:5)

Procedure—Proceed as directed in the chapter. After allowing the plate to air-dry, spray the plate with a 5% solution of 4-(p-nitrobenzyl)pyridine in acetone, and heat at 120° for 15 minutes. Before the plate cools, spray it with a 10% solution of tetraethylenepentamine in acetone, and immediately examine the plate: the principal spot in the chromatogram obtained from the *Test solution* corresponds in R_f value, size, and blue color to that in the chromatogram obtained from the *Standard solution*.

C: Dissolve 20 mg of Metrifonate in 1 mL of 2 N sodium hydroxide, add 1 mL of pyridine, shake, and heat on a water bath for 2 minutes: a red color develops in the pyridine layer.

D: To 100 mg of Metrifonate add 0.5 mL of nitric acid, 0.5 mL of a 50% solution of ammonium nitrate, and 0.1 mL of 30 percent hydrogen peroxide, and heat on a water bath for 10 minutes. Heat to boiling, and add 1 mL of ammonium molybdate TS: a yellow color precipitate is formed.

Acidity—Dissolve 2.5 g of it in carbon dioxide-free water, dilute with carbon dioxide-free water to 50 mL, and add 0.1 mL of methyl red TS. Not more than 1.0 mL of 0.1 N sodium hydroxide is required to change the color of the indicator.

Water Determination, Method I (921): not more than 0.3%.

Delete the following:

• **Heavy metals** (231): 0.001%. (Official 1-Jan-2018)

Limit of free chloride—Dissolve 5.0 g of Metrifonate in 30 mL of alcohol, and add a mixture of 100 mL of water and 15 mL of nitric acid. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically using a silver

electrode. Not more than 0.7 mL of 0.1 N silver nitrate is consumed (0.05%).

Chromatographic purity—

Solution A—Dissolve 1.36 g of monobasic potassium phosphate in water, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 3.0.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluent—Prepare a mixture of acetonitrile and water (1:1).

Standard preparation—Prepare a solution of USP Metrifonate RS in *Diluent* containing 20 mg per mL.

Test solution—Transfer 500 mg of Metrifonate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4-mm × 25-cm column that contains 5-μm packing L7. The column is maintained at a constant temperature of about 40°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	90	10	equilibration (10 minutes)
0–5	90	10	isocratic
5	90→85	10→15	step gradient
5–25	85	15	isocratic
25	85→45	15→55	step gradient
25–end*	45	55	isocratic

*The elution concludes at 3 times the retention time of metrifonate.

Procedure—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of each impurity taken by the formula:

$$100F(r_i / r_s)$$

in which *F* is a response factor, being 0.38 for the desmethylmetrifonate peak, if present at a retention time of 0.5 relative to that of Metrifonate, 0.03 for the dichlorvos peak, if present, at a retention time of 1.9 relative to that of Metrifonate, and 1.0 for any other impurity; *r_i* is the peak area for the individual impurity obtained from the *Test solution*; and *r_s* is the peak area for Metrifonate obtained from the *Standard solution*: not more than 1.0% of desmethylmetrifonate, 0.2% of dichlorvos, and 0.5% of any other impurity are found; and a total of not more than 1.0% of impurities other than desmethylmetrifonate and dichlorvos is found.

Assay—Dissolve about 300 mg of Metrifonate, accurately weighed, in 30 mL of alcohol. Add 10 mL of monoethanolamine, and allow to stand for 1 hour at 21 ± 1°. Cool while adding a mixture of 100 mL of water and 15 mL of nitric acid. While maintaining the temperature at 21 ± 1°, titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically using a silver electrode. Each mL of 0.1 N silver nitrate is equivalent to 25.74 mg of C₄H₈Cl₃O₄P.

Metronidazole

C₆H₉N₃O₃

171.15

1*H*-Imidazole-1-ethanol, 2-methyl-5-nitro-;
2-Methyl-5-nitroimidazole-1-ethanol [443-48-1].

DEFINITION

Metronidazole contains NLT 99.0% and NMT 101.0% of metronidazole (C₆H₉N₃O₃), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (177K): Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Methanol and water (1:4)

Standard solution: 0.03 mg/mL of USP Metronidazole RS in *Mobile phase*

Sample solution: 0.03 mg/mL of Metronidazole in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 319 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 30 μL

Run time: Twice the retention time of metronidazole

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of metronidazole (C₆H₉N₃O₃) in the portion of Metronidazole taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

C_U = concentration of Metronidazole in the *Sample solution* (mg/mL)

Acceptance criteria: 99.0%–101.0% on the dried basis

Metronidazole Benzoate Compounded Oral Suspension

DEFINITION

Metronidazole Benzoate Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole (C₆H₉N₃O₃).

Prepare Metronidazole Benzoate Compounded Oral Suspension containing 50 mg/mL of metronidazole as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Metronidazole (as the Benzoate) powder	5 g (8 g)
Ora-Blend ^a , a sufficient quantity to make	100 mL

^a Perrigo, Minneapolis, MN.

Place the *Metronidazole Benzoate powder* into a suitable mortar. Wet the powder with a small amount of *Ora-Blend*, and triturate to make a smooth paste. Add the *Ora-Blend* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated container. Add sufficient *Ora-Blend* to bring the preparation to final volume. Shake to mix well.

ASSAY

• PROCEDURE

Solution A: 0.1% (v/v) glacial acetic acid in water

Mobile phase: Acetonitrile and *Solution A* (40:60). Filter, and degas.

Standard solution: 0.4 mg/mL of metronidazole prepared from USP Metronidazole Benzoate RS in *Mobile phase*. Mix well until dissolved.

Sample solution: Shake thoroughly each bottle of Oral Suspension. Transfer 0.8 mL of the Oral Suspension into

a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix well.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 316 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 5 μL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for metronidazole is about 7.7 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metronidazole (C₆H₉N₃O₃) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of metronidazole in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

SPECIFIC TESTS

• **pH (791):** 3.6–4.6

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or at controlled room temperature.

• **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or controlled room temperature.

• **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.

• **USP REFERENCE STANDARDS (11)**

USP Metronidazole Benzoate RS

Metronidazole Capsules

DEFINITION

Metronidazole Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole (C₆H₉N₃O₃).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Wavelength range: Between 1600 and 1000 cm⁻¹

Acceptance criteria: Capsule contents show maxima only at the same wavelengths as those of similarly prepared USP Metronidazole RS.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Mobile phase: Methanol and water (1:4)

Standard solution: 0.03 mg/mL of USP Metronidazole RS in *Mobile phase*

Sample stock solution: Nominally 1 mg/mL of metronidazole prepared as follows. Mix the contents of

Capsules (NLT 20). Transfer an amount equivalent to 100 mg of metronidazole to a 100-mL volumetric flask, add 80 mL of *Mobile phase*, and sonicate with intermittent shaking for 10 min. Shake for 30 min, and dilute with *Mobile phase* to volume. Centrifuge a portion of the solution.

Sample solution: 0.03 mg/mL of metronidazole in *Mobile phase*, from the *Sample stock solution*. Pass a portion of the solution through a nylon membrane filter of 0.45- μ m or finer pore size. Discard the first 10 mL of the filtrate, and use the remainder.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 319 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 30 μ L

Run time: 2 times the retention time of the metronidazole peak

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for five replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metronidazole ($C_6H_9N_3O_3$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: 0.4 mg/mL of USP Metronidazole RS in *Medium*. Sonicate to dissolve if necessary.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, and discard the first few mL.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 278 nm

Cell: 0.05 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metronidazole ($C_6H_9N_3O_3$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times (1/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium*, 900 mL

Tolerances: NLT 85% (Q) of the labeled amount of metronidazole ($C_6H_9N_3O_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 1 μ g/mL of metronidazole from USP Metronidazole RS and 2 μ g/mL of tinidazole related compound A from USP Tinidazole Related Compound A RS in *Mobile phase*

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for tinidazole related compound A and metronidazole are 0.75 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between tinidazole related compound A and metronidazole

Tailing factor: NMT 2.0 for metronidazole

Relative standard deviation: NMT 6.0% for both tinidazole related compound A and metronidazole

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tinidazole related compound A in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tinidazole related compound A from the *Sample solution*

r_S = peak response of tinidazole related compound A from the *Standard solution*

C_S = concentration of USP Tinidazole Related Compound A RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified degradation product in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified degradation product from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tinidazole related compound A	0.75	0.1
Metronidazole	1.0	—
Each unspecified degradation product	—	0.1
Total impurities	—	0.5

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.

USP Metronidazole RS

USP Tinidazole Related Compound A RS

2-Methyl-5-nitroimidazole.

$C_4H_5N_3O_2$ 127.10

Metronidazole Gel

DEFINITION

Metronidazole Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_6H_9N_3O_3$).

IDENTIFICATION

- **A.** The UV spectrum of the metronidazole peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: Methanol and water (20:80)

Solution B: Methanol

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10.0	100	0
15.0	10	90
15.1	100	0
20.0	100	0

System suitability solution: 0.6 µg/mL of USP Metronidazole RS and 0.6 µg/mL of USP Tinidazole Related Compound A RS in *Solution A*

Standard solution: 30 µg/mL of USP Metronidazole RS in *Solution A*

Sample stock solution: Nominally 300 µg/mL of metronidazole in *Solution A* prepared as follows. Transfer a portion of Gel to a suitable volumetric flask. Add *Solution A* equivalent to 50% of the flask volume and sonicate or vortex until dissolved. Dilute with *Solution A* to volume. [NOTE—On the basis of formulation, if necessary, centrifuge a portion of the solution at 3000 rpm for 10 min and pass a portion of the supernatant through a filter of 0.45-µm pore size. Use the filtrate.]

Sample solution: Nominally 30 µg/mL of metronidazole in *Solution A* prepared from the *Sample stock solution*

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 319 nm. For *Identification test A*, use a diode-array detector in the range of 210–500 nm.

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 30 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between metronidazole and tinidazole related compound A, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metronidazole ($C_6H_9N_3O_3$) in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of metronidazole from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• ORGANIC IMPURITIES

Solution A, Solution B, Mobile phase, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: Use the *System suitability solution* from the Assay.

Sample solution: Use the *Sample stock solution* from the Assay.

System suitability

Sample: *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between metronidazole and tinidazole related compound A

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tinidazole related compound A in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tinidazole related compound A from the *Sample solution*

r_S = peak response of tinidazole related compound A from the *Standard solution*

C_S = concentration of USP Tinidazole Related Compound A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Calculate the percentage of each individual unspecified impurity in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified impurity from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tinidazole related compound A	0.76	0.2
Metronidazole	1.0	—
Any individual unspecified impurity	—	0.3
Total impurities	—	1.0

PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

SPECIFIC TESTS

- **PH (791):** The apparent pH determined potentiometrically is between 4.0 and 6.5.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in laminated collapsible tubes at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
 - USP Metronidazole RS
 - USP Tinidazole Related Compound A RS
 - 2-Methyl-5-nitroimidazole.
 - $C_4H_5N_3O_2$ 127.10

Metronidazole Injection**DEFINITION**

Metronidazole Injection is a sterile, isotonic, buffered solution of Metronidazole in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_4H_5N_3O_2$).

IDENTIFICATION

- **A.** The UV (UV-Vis) spectrum of the metronidazole peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Mobile phase: Methanol and water (20:80)

System suitability solution: 1 µg/mL of USP Metronidazole RS and 2 µg/mL of USP Tinidazole Related Compound A RS in *Mobile phase*

Standard solution: 0.03 mg/mL of USP Metronidazole RS in *Mobile phase*

Sample solution: Nominally 0.03 mg/mL of metronidazole in *Mobile phase* prepared as follows. Transfer a portion of Injection to a suitable volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 319 nm. For *Identification test A*, use a diode array detector in the range of 210–800 nm.

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 30 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 4.0 between metronidazole and tinidazole related compound A, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of metronidazole ($C_4H_5N_3O_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES**• ORGANIC IMPURITIES**

Mobile phase, Chromatographic system, and System suitability solution: Proceed as directed in the *Assay*.

Standard solution: 0.75 µg/mL each of USP Metronidazole RS and USP Tinidazole Related Compound A RS in *Mobile phase*

Sample solution: Nominally 500 µg/mL of metronidazole prepared as follows. Transfer a portion of Injection to a suitable volumetric flask. Add *Mobile phase* equivalent to 50% of the flask size. Sonicate for 2 min. Dilute with *Mobile phase* to volume, and pass a portion of the solution through a filter of 0.45-µm pore size. Use the filtrate.

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 4.0 between metronidazole and tinidazole related compound A, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tinidazole related compound A in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tinidazole related compound A from the *Sample solution*

r_S = peak response of tinidazole related compound A from the *Standard solution*

C_S = concentration of USP Tinidazole Related Compound A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each unspecified impurity from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tinidazole related compound A	0.7	0.15
Metronidazole	1.0	—
Any individual unspecified degradation product	—	0.15
Total impurities	—	2.0

SPECIFIC TESTS

• **PH (791):** 4.5–7.0

• **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.35 USP Endotoxin Units/mg of metronidazole

- **PARTICULATE MATTER IN INJECTIONS** (788): It meets the requirements for small-volume injections.
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers of Type I or Type II glass, or in suitable plastic containers, protected from light. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
 - USP Endotoxin RS
 - USP Metronidazole RS
 - USP Tinidazole Related Compound A RS
 - 2-Methyl-5-nitroimidazole.
 - $C_4H_5N_3O_2$ 127.10

Metronidazole Tablets

DEFINITION

Metronidazole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_6H_9N_3O_3$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION** (197U)
 - Sample stock solution:** Equivalent to 15 mg/mL of metronidazole from powdered Tablets in dilute hydrochloric acid (1 in 100). Shake for several min, and filter.
 - Medium:** Sulfuric acid in methanol (1 in 350)
 - Sample solution:** 20 µg/mL of metronidazole in *Medium* from the *Sample stock solution*
 - Acceptance criteria:** Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**
 - Mobile phase:** Methanol and water (20:80)
 - Standard solution:** 0.5 mg/mL of USP Metronidazole RS in *Mobile phase*
 - Sample stock solution:** Nominally 10 mg/mL of metronidazole in methanol from Tablets prepared as follows. Transfer 10 Tablets, whole or ground, to a suitable size volumetric flask. Add methanol, and shake by mechanical means for 30 min or until the Tablets are disintegrated. Dilute with methanol to volume, and allow the solution to stand until the insoluble material has settled.
 - Sample solution:** Nominally 0.5 mg/mL of metronidazole in *Mobile phase* prepared from the clear supernatant of the *Sample stock solution*. Filter.
- Chromatographic system**
 - (See *Chromatography* (621), *System Suitability*.)
 - Mode:** LC
 - Detector:** UV 254 nm
 - Column:** 4.6-mm × 15-cm; packing L7
 - Flow rate:** 1 mL/min
 - Injection volume:** 10 µL
- System suitability**
 - Sample:** *Standard solution*
 - Suitability requirements**
 - Tailing factor:** NMT 2
 - Relative standard deviation:** NMT 2.0%
- Analysis**
 - Samples:** *Standard solution* and *Sample solution*
 - Calculate the percentage of the labeled amount of metronidazole ($C_6H_9N_3O_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of metronidazole from the *Sample solution*
- r_S = peak response of metronidazole from the *Standard solution*
- C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)
- C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)
- Acceptance criteria:** 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** (711)
 - Medium:** 0.1 N hydrochloric acid; 900 mL
 - Apparatus 1:** 100 rpm
 - Time:** 60 min
 - Standard solution:** USP Metronidazole RS in *Medium*
 - Sample solution:** Filter a portion of the solution under test, and dilute with *Medium* to a concentration similar to that of the *Standard solution*.
- Instrumental conditions**
 - Mode:** UV
 - Analytical wavelength:** 278 nm
 - Blank:** *Medium*
- Analysis**
 - Samples:** *Standard solution*, *Sample solution*, and *Blank*
 - Calculate the percentage of the labeled amount of metronidazole ($C_6H_9N_3O_3$) dissolved.

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times D \times 100$$

- A_U = absorbance of the *Sample solution*
- A_S = absorbance of the *Standard solution*
- C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)
- V = volume of *Medium*, 900 mL
- L = label claim (mg/Tablet)
- D = dilution factor to prepare the *Sample solution*
- Tolerances:** NLT 85% (Q) of the labeled amount of metronidazole ($C_6H_9N_3O_3$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

- Procedure for content uniformity**
 - Diluent:** Diluted hydrochloric acid (1 in 100)
 - Standard solution:** 20 µg/mL of USP Metronidazole RS in *Diluent*
 - Sample stock solution:** Transfer 1 Tablet to a 250-mL volumetric flask. Add about 100 mL of *Diluent*, and shake for 30 min. Dilute with *Diluent* to volume. Filter, discarding the first 15 mL of the filtrate. Nominally 200 µg/mL of metronidazole is prepared by transferring the filtrate quantitatively with the *Diluent*.
 - Sample solution:** 20 µg/mL of metronidazole in *Diluent* from *Sample stock solution*
- Instrumental conditions**
 - Mode:** UV
 - Analytical wavelength:** 278 nm
 - Cell:** 1 cm
 - Blank:** *Diluent*
- Analysis**
 - Samples:** *Standard solution*, *Sample solution*, and *Blank*
 - Calculate the quantity, in mg, of metronidazole ($C_6H_9N_3O_3$) in each Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times L$$

- A_U = absorbance of the *Sample solution*
- A_S = absorbance of the *Standard solution*
- C_S = concentration of USP Metronidazole RS in the *Standard solution* (µg/mL)
- C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)
- L = label claim (mg/Tablet)

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase: Methanol and water (20:80)

Standard solution: 0.5 µg/mL of USP Metronidazole RS and 2.5 µg/mL of USP Tinidazole Related Compound A RS in *Mobile phase*

Sample solution: Nominally 500 µg/mL of metronidazole prepared as follows. Transfer a suitable amount of powdered Tablets (NLT 20) to a suitable volumetric flask. Add *Mobile phase* equivalent to 80% of the flask size. Sonicate for 10 min. Dilute with *Mobile phase* to volume, and pass a portion of the solution through a suitable filter. Use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 319 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 30 µL

System suitability

Sample: *Standard solution*

[NOTE—See *Table 1* for relative retention times.]

Suitability requirements

Resolution: NLT 4.0 between metronidazole and tinidazole related compound A

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tinidazole related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tinidazole related compound A from the *Sample solution*

r_S = peak response of tinidazole related compound A from the *Standard solution*

C_S = concentration of USP Tinidazole Related Compound A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Metronidazole Extended-Release Tablets

DEFINITION

Metronidazole Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_6H_9N_3O_3$).

IDENTIFICATION

• A. ULTRAVIOLET ABSORPTION (197U)

Diluent: Methanol and sulfuric acid (350:1)

Standard stock solution: 15 mg/mL of USP Metronidazole RS in dilute hydrochloric acid (1 in 100).

Sonicate to dissolve and pass through a suitable filter.

Standard solution: 18.8 µg/mL of USP Metronidazole RS in *Diluent* from *Standard stock solution*

Sample stock solution: Nominally 15 mg/mL of metronidazole prepared as follows. Finely powder NLT 5 Tablets and transfer an amount equivalent to 300 mg of metronidazole into a 20-mL volumetric flask. Add about 15 mL of dilute hydrochloric acid (1 in 100) and shake mechanically for 30 min. Dilute with dilute hydrochloric acid (1 in 100) to volume and shake well. Pass through a suitable filter.

Sample solution: Nominally equivalent to 18.8 µg/mL of metronidazole in *Diluent* from *Sample stock solution*

Wavelength range: 200–400 nm

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 1.4 g/L of monobasic potassium phosphate in water

Mobile phase: Methanol and *Buffer* (30:70)

Standard solution: 0.1 mg/mL of USP Metronidazole RS in *Mobile phase*

Sample stock solution: Nominally 2.0 mg/mL of metronidazole from NLT 20 finely powdered Tablets in *Mobile phase*, prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add 60% of the flask volume with *Mobile phase*, and shake by mechanical means for 30 min. Dilute with *Mobile phase* to volume. Allow the solution to stand until the insoluble material settles.

Sample solution: Nominally 0.1 mg/mL of metronidazole in *Mobile phase* from the *Sample stock solution* supernatant. Pass the solution through a suitable filter of 0.45-µm pore size.

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of metrapone (C₁₄H₁₄N₂O) in the portion of Metrapone taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

 A_U = absorbance of the *Sample solution* A_S = absorbance of the *Standard solution* C_S = concentration of USP Metrapone RS in the *Standard solution* (μg/mL) C_U = concentration of Metrapone in the *Sample solution* (μg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES• **RESIDUE ON IGNITION** (281): NMT 0.1%**Delete the following:**• **HEAVY METALS**, *Method II* (231): NMT 10 ppm • (Official 1-Jan-2018)• **ORGANIC IMPURITIES**

Standard stock solution: 0.2 mg/mL of USP Metrapone RS in methanol

Standard solution A: 40 μg/mL of USP Metrapone RS in methanol

Standard solution B: 20 μg/mL of USP Metrapone RS in methanol

Sample solution: 20 mg/mL of Metrapone in methanol

Chromatographic system(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μL

Developing solvent system: Chloroform and methanol (48:3)

AnalysisSamples: *Standard stock solution*, *Standard solution A*, *Standard solution B*, and *Sample solution*Apply each of the *Samples* separately to the TLC plate.Position the plate in a chromatographic chamber, and develop the chromatograms in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry under a stream of nitrogen for about 10 min. Position the dried plate once again in the same chromatographic chamber, and again develop the chromatograms until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry under a current of warm air for about 15 min. Examine the plate under short-wavelength UV light, and compare the

intensities of any secondary spots observed in the chromatogram of the *Sample solution* with those of the principal spots in the chromatograms of the *Standard solutions*.

Acceptance criteria: The intensity of any secondary spot from the *Sample solution* is NMT the principal spot from *Standard solution A* (0.2%), and the sum of the intensities of the secondary spots from the *Sample solution* corresponds to NMT 1.0%.

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample under vacuum at room temperature for 6 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from heat and light.

• USP REFERENCE STANDARDS (11)

USP Metyrapone RS

Metyrapone Tablets

DEFINITION

Metyrapone Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of metyrapone ($C_{14}H_{14}N_2O$).

IDENTIFICATION

• A. INFRARED ABSORPTION

Sample solution: Transfer 500 mg of metyrapone from powdered Tablets into a centrifuge tube. Add 10 mL of 1 N sodium hydroxide, and mix. Extract with 10 mL of chloroform, centrifuge, and filter.

Acceptance criteria: The IR absorption spectrum of the *Sample solution*, determined in a 0.5-mm cell against chloroform, exhibits maxima only at the same wavelengths as that of a similar solution of USP Metyrapone RS.

• B. UV ABSORPTION

Sample solution: Transfer 1 mL of the filtrate obtained in *Identification test A* to a centrifuge tube. Add 20 mL of chloroform, and extract with 30 mL of 1 N sulfuric acid, centrifuging and filtering the sulfuric acid layer through a pledget of cotton. Mix 1 mL of this solution with 99 mL of 1 N sulfuric acid.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Metyrapone RS, concomitantly measured.

ASSAY

• PROCEDURE

Solution A: 13.3 mg/mL of 2,4-dinitrophenylhydrazine in methanol. Shake by mechanical means for about 15 min, and filter. Prepare fresh daily.

Solution B: *Solution A* and hydrochloric acid (23:2)

Solution C: 50 mg/mL of potassium hydroxide in methanol, and filter

Diluent: Chloroform and methanol (1:1)

Standard solution: 0.1 mg/mL of USP Metyrapone RS in chloroform

Sample stock solution: Nominally equivalent to 25 mg of metyrapone from powdered Tablets (NLT 20) prepared as follows. Transfer a suitable amount of powdered Tablets to a centrifuge tube with the aid of 10 mL of 1 N sodium hydroxide. Shake gently, and extract with three 15-mL portions of chloroform. Centrifuge each extract, filtering through a pledget of cotton, previously washed with chloroform, into a 50-mL volumetric flask. Add chloroform to volume, and mix.

Sample solution: Nominally 0.1 mg/mL from the *Sample stock solution* in chloroform

Instrumental conditions

Mode: Vis

Analytical wavelength: 450 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and chloroform (blank)

Pipet 3 mL each of the *Standard solution*, the *Sample solution*, and the blank into separate 50-mL volumetric flasks. To each flask add 1 mL of *Solution B*, and shake lightly. Evaporate the solutions on a steam bath to near dryness. Wash down the sides of the flask with 1 mL of *Diluent*, and again evaporate the solutions to near dryness. Heat the flasks in an oven maintained at 110°–120° for 30 min. Remove the flasks, pipet 10 mL of *Solution C* into each flask, and heat again in the boiling water bath for 1 min. Allow to cool to room temperature, insert the stoppers, and shake by mechanical means for 5 min. Add methanol to volume, and mix. Measure the absorbance of the *Standard solution* and the *Sample solution* after the extraction against the blank.

Calculate the percentage of the labeled amount of metyrapone ($C_{14}H_{14}N_2O$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Metyrapone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metyrapone in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: Known concentration of USP Metyrapone RS in *Medium*

Sample solution: Portions of the solution under test suitably diluted with *Medium*, and filtered

Instrumental conditions

Mode: UV

Analytical wavelength: 259 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 60% (Q) of the labeled amount of metyrapone ($C_{14}H_{14}N_2O$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

• USP REFERENCE STANDARDS (11)

USP Metyrapone RS

Metyrosine

$C_{10}H_{13}NO_3$ 195.22

L-Tyrosine, α -methyl-, (–)-.

(-)- α -Methyl-L-tyrosine [672-87-7].

» Metyrosine contains not less than 98.6 percent and not more than 101.0 percent of $C_{10}H_{13}NO_3$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Metyrosine RS

Identification—

A: Infrared Absorption (197M).

B: Ultraviolet Absorption (197U)—

Solution: 15 μ g per mL.

Medium: 0.1 N hydrochloric acid.

Absorptivities at 224 nm, calculated on the dried basis, do not differ by more than 3.0%.

Specific rotation (781S): between $+185^\circ$ and $+195^\circ$ ($t = 30^\circ$; $\lambda = 546$ nm; $l = 0.5$ dm).

Test solution: 5 mg per mL, in *Diluent*, with the aid of sonication if necessary. Prepare the *Diluent* as follows.

Solution A—Dissolve 20.0 g of anhydrous sodium acetate in about 150 mL of water in a 250-mL volumetric flask. Add 50.0 mL of glacial acetic acid, dilute with water to volume, and mix.

Solution B—Dissolve 62.5 g of cupric sulfate in water in a 200-mL volumetric flask, dilute with water to volume, and mix.

Diluent—Mix *Solution A* and *Solution B* in a 1000-mL volumetric flask, dilute with water to volume, and mix.

Loss on drying (731)—Dry it at a pressure not exceeding 5 mm of mercury at 100° for two hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II** (231): 0.003%. (Official 1-Jan-2018)

Chromatographic purity—

Standard solutions—Dissolve USP Metyrosine RS in a solvent mixture of methanol and ammonium hydroxide (7:3) to obtain a solution having a concentration of 10 mg per mL (*Standard solution A*). Pipet 1 mL of *Standard solution A* into a 100-mL volumetric flask, dilute with the same solvent mixture to volume, and mix (*Standard solution B*). Pipet 5 mL of *Standard solution B* into a 10-mL volumetric flask, dilute with the same solvent mixture to volume, and mix (*Standard solution C*). Pipet 5 mL of *Standard solution C* into a 10-mL volumetric flask, dilute with the same solvent mixture to volume, and mix (*Standard solution D*).

Test solution—Dissolve Metyrosine in the solvent mixture of methanol and ammonium hydroxide (7:3) to obtain a solution having a concentration of 10 mg per mL.

Procedure—Apply 10- μ L portions of *Standard solutions A, B, C, and D* and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture and previously washed with methanol. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-propyl alcohol and ammonium hydroxide (7:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate. Expose the plate to iodine vapors, and examine under short-wavelength UV light: the chromatogram shows principal spots at about the same R_f value. Estimate the levels of any additional spots observed in the chromatogram of the *Test solution* by comparison with the spots in the chromatograms of *Standard solutions B, C, and D*: the sum of the intensities of any spots observed is not greater

than that of the principal spot obtained from *Standard solution B*, corresponding to not more than 1%.

Assay—Dissolve about 300 mg of Metyrosine, accurately weighed, in about 100 mL of glacial acetic acid, sonicate for about 5 minutes, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a platinum ring electrode and a sleeve-type calomel electrode containing 0.1 N lithium perchlorate in glacial acetic acid (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 19.52 mg of $C_{10}H_{13}NO_3$.

Metyrosine Capsules

» Metyrosine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metyrosine ($C_{10}H_{13}NO_3$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Metyrosine RS

Identification—The UV absorption spectrum of a 1 in 10,000 solution of the Capsule contents in dilute hydrochloric acid (1 in 100) exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Metyrosine RS, concomitantly measured.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 750 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{10}H_{13}NO_3$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 274 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Metyrosine RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{10}H_{13}NO_3$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Standard preparation—Dissolve a suitable quantity of USP Metyrosine RS, accurately weighed, in dilute hydrochloric acid (1 in 100) to obtain a solution having a known concentration of about 100 μ g per mL.

Assay preparation—Combine the contents of not less than 20 Capsules, and transfer an accurately weighed portion of the combined contents, equivalent to about 100 mg of metyrosine, to a 100-mL volumetric flask. Add 50 mL of dilute hydrochloric acid (1 in 100), shake by mechanical means for 45 minutes, dilute with dilute hydrochloric acid (1 in 100) to volume, mix, and filter. Transfer 10.0 mL of the filtrate to a 100-mL volumetric flask, dilute with dilute hydrochloric acid solution (1 in 100) to volume, and mix. Concomitantly determine the absorbances of this solution and the *Standard preparation* at the wavelength of maximum absorbance at about 274 nm, with a suitable spectrophotometer, using dilute hydrochloric acid solution (1 in 100) as the blank. Calculate the quantity, in mg, of metyrosine ($C_{10}H_{13}NO_3$) in the portion of Capsules taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Metyrosine RS in the *Standard preparation*, and A_U and A_S

are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mexiletine Hydrochloride

$C_{11}H_{17}NO \cdot HCl$ 215.72
2-Propanamine, 1-(2,6-dimethylphenoxy)-, hydrochloride, (±)-;
(±)-1-Methyl-2-(2,6-xylyloxy)ethylamine hydrochloride [5370-01-04].

DEFINITION

Mexiletine Hydrochloride contains NLT 98.0% and NMT 102.0% of mexiletine hydrochloride ($C_{11}H_{17}NO \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.**
Sample solution: 3 mL of a solution (1 in 60)
Analysis: Add 1 mL of 6 N ammonium hydroxide to the *Sample solution*, filter, and acidify the filtrate with 2 mL of nitric acid. Then add 1 mL of silver nitrate TS.
Acceptance criteria: A curdy, white precipitate is formed, and it is soluble in an excess of 6 N ammonium hydroxide (presence of chloride).

ASSAY

• PROCEDURE

Buffer: Dissolve 11.5 g of anhydrous sodium acetate in 500 mL of water. Add 3.2 mL of glacial acetic acid, mix, and allow to cool. Adjust with hydrochloric acid to a pH of 4.8 ± 0.1 , and dilute with water to 1000 mL.

Mobile phase: Methanol and *Buffer* (600:400)

Standard solution: 2 mg/mL of USP Mexiletine Hydrochloride RS in *Mobile phase*

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in tight containers.• **USP REFERENCE STANDARDS (11)**

USP Mexiletine Hydrochloride RS

Mexiletine Hydrochloride Capsules

» Mexiletine Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mexiletine hydrochloride ($C_{11}H_{17}NO \cdot HCl$).

Packaging and storage—Preserve in tight containers.**USP Reference standards (11)**—

USP Mexiletine Hydrochloride RS

Identification—

A: Transfer a quantity of Capsule contents, equivalent to about 250 mg of mexiletine hydrochloride, to a suitable test tube, add 10 mL of methanol, and mix on a vortex mixer for 1 minute. Filter the mixture, evaporate the filtrate under a stream of nitrogen to dryness, and dry the residue in vacuum at 60° for 1 hour: the IR absorption spectrum of a mineral oil dispersion of the dried residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Mexiletine Hydrochloride RS.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{11}H_{17}NO \cdot HCl$ dissolved from the difference between first derivative values at the wavelengths of maximum and minimum first derivative absorbance in the wavelength range from 230 to 290 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Mexiletine Hydrochloride RS in the same *Medium*.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{11}H_{17}NO \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—

Mobile phase, Standard preparation, and Resolution solution—Prepare as directed in the *Assay* under *Mexiletine Hydrochloride*.

Standard solution—Transfer 10.0 mL of the *Standard preparation* prepared as directed in the *Assay* under *Mexiletine Hydrochloride* to a 1000-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 20 µg of USP Mexiletine Hydrochloride RS per mL.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay*.

Chromatographic system (see *Chromatography* (621))—Prepare as directed in the *Assay* under *Mexiletine Hydrochloride*, except that the relative standard deviation of replicate injections of the *Standard solution* is not more than 3.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph; record the chromatograms using a high sensitivity setting for the recorder; and measure the areas for the peaks. Calculate the percentage of each impurity observed by the formula:

$$100(C/L)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Mexiletine Hydrochloride RS in the *Standard solution*; L is the quantity, in mg, of mexiletine hydrochloride in each mL of the *Test solution*, based on the labeled amount in the portion of Capsule contents used to prepare the *Assay preparation* and the extent of dilution; r_U is the peak area obtained from an individual impurity observed in the chromatogram of the *Test solution*; and r_S is the mexiletine peak area obtained from the *Standard solution*: not more than 1% of any individual impurity is found; and the total of all observed impurities is not more than 1.5%.

Assay—

Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Prepare as directed in the *Assay* under *Mexiletine Hydrochloride*.

Assay preparation—Weigh the contents of not fewer than 20 Capsules, and calculate the average weight per Capsule. Mix the combined contents of the Capsules, and transfer an accurately weighed portion, equivalent to about 50 mg of mexiletine hydrochloride, to a stoppered, 50-mL centrifuge tube. Add 25.0 mL of *Mobile phase*, insert the stopper, and shake by mechanical means for 15 minutes. Centrifuge, and use the clear supernatant as the *Assay preparation*. [NOTE—Reserve a portion of this solution for use as the *Test solution* in the test for *Chromatographic purity*.]

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Mexiletine Hydrochloride*. Calculate the quantity, in mg, of mexiletine hydrochloride ($C_{11}H_{17}NO \cdot HCl$) in the portion of Capsule contents taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Mexiletine Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the mexiletine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mezlocillin Sodium $C_{21}H_{24}NaN_5O_8S_2$

561.56

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-6-[[[3-(methylsulfonyl)-2-oxo-1-imidazolidinyl]carbonyl]amino]phenylacetyl] amino]-7-oxo-, monosodium salt, [2S-[2α,5α,6β (S*)]]-; Sodium (2S,5R,6R)-3,3-dimethyl-6-[(R)-2-[3-(methylsulfonyl)-2-oxo-1-imidazolidinecarboxamido]-2-phenylacetamido]-

USP Mezlocillin Sodium RS

Mezlocillin for Injection

» Mezlocillin for Injection contains an amount of Mezlocillin Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of mezlocillin ($C_{21}H_{25}N_5O_8S_2$).

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1–May-2017).

USP Reference standards

USP Endotoxin RS

USP Mezlocillin Sodium RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

Bacterial Endotoxins Test (85)—It contains not more than 0.06 USP Endotoxin Unit per mg of mezlocillin.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to Be Examined*.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It responds to the *Identification tests* and meets the requirements for *Specific rotation, pH, and Water under Mezlocillin Sodium*. It meets also the requirements for *Uniformity of Dosage Units* (905) and *Labeling* (7), *Labels and Labeling for Injectable Products*.

Assay—

Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Prepare as directed for the *Assay under Mezlocillin Sodium*.

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Mezlocillin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with water to obtain a solution containing about 0.5 mg of mezlocillin per mL.

Assay preparation 2 (where the label states the quantity of mezlocillin in a given volume of constituted solution)—Constitute Mezlocillin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured portion of the constituted solution quantitatively with water to obtain a solution containing about 0.5 mg of mezlocillin per mL.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and *Assay preparation 1* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in

mg, of mezlocillin in the container, or in the portion of constituted solution taken by the formula:

$$(L/D)(C/1000)(r_U/r_S)$$

in which L is the labeled quantity, in mg, of mezlocillin in the container, or in the volume of constituted solution taken, D is the concentration, in mg per mL, of mezlocillin in Assay preparation 1 or in Assay preparation 2, on the basis of the labeled quantity in the container, or in the portion of constituted solution taken, respectively, and the extent of dilution, C is the concentration, in μg per mL, of mezlocillin ($\text{C}_{21}\text{H}_{25}\text{N}_5\text{O}_8\text{S}_2$) in the Standard preparation, and r_U and r_S are the mezlocillin peak responses obtained from the Standard preparation and from Assay preparation 1 or Assay preparation 2, as appropriate.

Mibolerone

$\text{C}_{20}\text{H}_{30}\text{O}_2$ 302.45
Estr-4-en-3-one, 17-hydroxy-7,17-dimethyl-, (7 α ,17 β)-
17 β -Hydroxy-7 α ,17-dimethylestr-4-en-3-one [3704-09-4].

» Mibolerone contains not less than 96.0 percent and not more than 106.0 percent of $\text{C}_{20}\text{H}_{30}\text{O}_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—
USP Mibolerone RS

Identification, Infrared Absorption (197M).

Specific rotation (781S): between +34° and +40°.

Test solution: 10 mg per mL, in chloroform.

Loss on drying (731)—Dry about 1 g, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.5%.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, tetrahydrofuran, and methanol (60:25:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Prepare a solution of progesterone in methanol containing 0.6 mg per mL.

Standard preparation—Prepare a solution of USP Mibolerone RS in *Internal standard solution* having a known concentration of about 0.4 mg per mL. Mix, and sonicate if necessary to achieve complete solution.

Assay preparation—Transfer about 10 mg of Mibolerone, accurately weighed, to a 25-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix. Sonicate if necessary to achieve complete solution.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about

0.6 for mibolerone and 1.0 for progesterone; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $\text{C}_{20}\text{H}_{30}\text{O}_2$ in the portion of Mibolerone taken by the formula:

$$25C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Mibolerone RS in the *Standard preparation*; and R_U and R_S are the ratios of the peak responses of the mibolerone peak and the progesterone peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mibolerone Oral Solution

» Mibolerone Oral Solution contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of mibolerone ($\text{C}_{20}\text{H}_{30}\text{O}_2$).

Packaging and storage—Preserve in tight containers, protected from light.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—
USP Mibolerone RS

Identification—The chromatogram of the *Assay preparation* exhibits a major peak for mibolerone, the retention time of which corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Specific gravity (841): between 1.030 and 1.045.

Assay—

Internal standard solution—Prepare a solution of 1,3,5-triphenylbenzene in chloroform containing about 0.25 mg per mL.

Standard preparation—Prepare a solution of USP Mibolerone RS in *Internal standard solution* having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer an accurately weighed portion of Oral Solution, equivalent to about 1000 μg of mibolerone, to a 125-mL separator containing 60 mL of water, and swirl to disperse. Add 30 mL of methylene chloride, shake gently for about 5 minutes, and allow the phases to separate. Drain the lower methylene chloride layer through a pledget of methylene chloride-washed cotton into a 50-mL conical flask. Evaporate to dryness under a current of air. Re-extract the aqueous layer remaining in the separator with an additional 30-mL portion of methylene chloride, draining the filtered methylene chloride extract into the 50-mL conical flask, and evaporating it to dryness. Add 2.0 mL of *Internal standard solution*, and swirl to dissolve.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm \times 61-cm column packed with 1% liquid phase G6 on support S1AB. The column is maintained at about 175° and the detector at 195° to 225°. Helium is used as the carrier gas at a flow rate of about 60 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for the internal standard and 1.0 for mibolerone; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μ g, of mibolerone ($C_{20}H_{30}O_2$) in each mL of the Oral Solution taken by the formula:

$$2000(C / W_U)(D)(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Mibolerone RS in the *Standard preparation*; *W_U* is the weight, in g, of Oral Solution taken to prepare the *Assay preparation*; *D* is the specific gravity of the Oral Solution; and *R_U* and *R_S* are the ratios of the peak height response of the mibolerone peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Miconazole

$C_{18}H_{14}Cl_4N_2O$

416.13

1*H*-Imidazole, 1-2-[(2,4-dichlorophenyl)-2-[(2,4-dichlorophenyl)methoxy]ethyl]-, (±)-;
(±)-1-[2,4-Dichloro-β-[(2,4-dichlorobenzyl)oxy]phenethyl]imidazole [22916-47-8].

DEFINITION

Miconazole contains NLT 98.0% and NMT 102.0% of miconazole ($C_{18}H_{14}Cl_4N_2O$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B.

Sample solution: Dissolve 40 mg in 50 mL of isopropyl alcohol in a 100-mL volumetric flask, and add 10 mL of 0.1 N hydrochloric acid. Dilute with isopropyl alcohol to volume.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Miconazole RS, concomitantly measured.

ASSAY

• PROCEDURE

Sample solution: 300 mg of Miconazole in 40 mL of glacial acetic acid. Add 4 drops of *p*-naphtholbenzein TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* with *Titrant* to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.61 mg of miconazole ($C_{18}H_{14}Cl_4N_2O$).

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.2%

• ORGANIC IMPURITIES

Standard solution A: 10 mg/mL of USP Miconazole RS in chloroform

Standard solution B: 100 μ g/mL of USP Miconazole RS from *Standard solution A* in chloroform

Sample solution: 10 mg/mL in chloroform

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: *n*-Hexane, chloroform, methanol, and ammonium hydroxide (60:30:10:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* separately to the starting line of the plate. Develop the chromatogram in a suitable chamber with freshly prepared *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow the solvent to evaporate. Expose the plate to iodine vapors in a closed chamber for 30 min, and locate the spots.

Acceptance criteria: The *R_f* value of the principal spot from the *Sample solution* corresponds to that from *Standard solution A*, and any other spot from the *Sample solution* does not exceed, in size or intensity, the principal spot from *Standard solution B* (1.0%).

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample under vacuum at 60° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers, protected from light. Store at 25°, excursions permitted between 15° and 30°.

• USP REFERENCE STANDARDS (11)

USP Miconazole RS

Miconazole Injection

DEFINITION

Miconazole Injection is a sterile solution of Miconazole in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of miconazole ($C_{18}H_{14}Cl_4N_2O$).

IDENTIFICATION

• A.

Solution A: 17 mg/mL of bismuth subnitrate in a mixture of glacial acetic acid and water (1:4)

Solution B: 400 mg/mL of potassium iodide in water

Standard solution: 5 mg/mL of USP Miconazole RS in methanol

Sample solution: Nominally 5 mg/mL of miconazole in methanol

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: *n*-Hexane, chloroform, methanol, and ammonium hydroxide (60:30:10:1)

Spray reagent (Dragendorff's TS): *Solution A*, *Solution B*, glacial acetic acid, and water (1:1:4:14)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* separately to the starting line of the plate. Develop the chromatogram in a suitable chamber with freshly prepared *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow the solvent to evaporate. Locate the spots on the plate by spraying with *Spray reagent*.

Acceptance criteria: The R_f value of one of the principal spots from the *Sample solution* corresponds to that from the *Standard solution*.

ASSAY**• PROCEDURE**

Solution A: 25 mg/mL of ammonium acetate in water
Mobile phase: Acetonitrile, methanol, and *Solution A* (30:50:20)

System suitability solution: 50 µg/mL each of USP Miconazole RS and dibutyl phthalate in *Mobile phase*

Standard solution: 50 µg/mL of USP Miconazole RS in *Mobile phase*

Sample solution: Nominally 50 µg/mL of miconazole in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 30-cm; packing L7

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for dibutyl phthalate and miconazole are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5.0 between the dibutyl phthalate and miconazole peaks, *System suitability solution*

Tailing factor: NMT 1.3 for the miconazole peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Allow the chromatograph to run for at least 16–18 min between injections to allow for elution of all components associated with the Injection vehicle.

Calculate the percentage of the labeled amount of miconazole ($C_{18}H_{14}Cl_4N_2O$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Miconazole RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of miconazole in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• pH (791): 3.7–5.7

• BACTERIAL ENDOTOXINS TEST (85): NMT 0.10 USP Endotoxin Unit/mg of miconazole

• PARTICULATE MATTER IN INJECTIONS (788): Meets the requirements for small-volume injections

• INJECTIONS AND IMPLANTED DRUG PRODUCTS (1): Meets the requirements

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in single-dose containers, preferably of Type I glass, at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Endotoxin RS

USP Miconazole RS

Miconazole Nitrate

$C_{18}H_{14}Cl_4N_2O \cdot HNO_3$

479.14

1*H*-Imidazole, 1-[2-(2,4-dichlorophenyl)-2-[(2,4-dichlorophenyl)methoxy]ethyl]-, mononitrate; 1-[2,4-Dichloro-β-[(2,4-dichlorobenzyl)oxy]phenethyl]imidazole mononitrate [22832-87-7].

DEFINITION

Miconazole Nitrate contains NLT 98.0% and NMT 102.0% of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. ULTRAVIOLET ABSORPTION (197U)

Sample solution: 400 µg/mL in a mixture of 0.1 N hydrochloric acid in isopropyl alcohol (1 in 10)

Acceptance criteria: Meets the requirements

ASSAY**• PROCEDURE**

Sample solution: 350 mg of Miconazole Nitrate in 50 mL of glacial acetic acid

Titrimetric system

Mode: Direct titration

Titant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Titrate the *Sample solution* with *Titant* using a glass-calomel electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 47.92 mg of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.2%

• ORGANIC IMPURITIES

Mobile phase: Methanol, acetonitrile, and 0.2 M ammonium acetate (32:30:38)

System suitability solution: 25 µg/mL each of USP Miconazole Nitrate RS and USP Econazole Nitrate RS in *Mobile phase*

Sample stock solution: 10 mg/mL of Miconazole Nitrate in *Mobile phase*

Sample solution: 25 µg/mL of Miconazole Nitrate, from *Sample stock solution*, in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 10-cm; 3-µm packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

Run time: 1.2 times the retention time of the main peak

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for econazole and miconazole are 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 10 between econazole and miconazole

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Sample stock solution* and *Sample solution*

Measure the responses of all peaks, excluding the peak representing nitrate ion and any peak producing a response less than 0.2 times the response of the main peak.

Acceptance criteria: The response of any individual peak, other than the main peak of the *Sample stock solution*, is NMT that of the main peak of the *Sample solution* (0.25%), and the sum of the responses of all peaks, other than the main peak of the *Sample stock solution*, is NMT twice the response of the main peak of the *Sample solution* (0.5%).

SPECIFIC TESTS

- Loss on Drying (731)**

Analysis: Dry a sample at 105° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light.
- USP REFERENCE STANDARDS (11)**
USP Econazole Nitrate RS
USP Miconazole Nitrate RS

Miconazole Nitrate Cream**DEFINITION**

Miconazole Nitrate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

- PROCEDURE**

Buffer: Triethylamine and water (10:1000). Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Methanol, acetonitrile, tetrahydrofuran, and *Buffer* (5:4:3:8)

Standard solution: 0.28 mg/mL of USP Miconazole Nitrate RS and 0.02 mg/mL of benzoic acid in *Mobile phase*

Sample solution: Nominally 0.28 mg/mL of miconazole nitrate in *Mobile phase* prepared as follows. Dissolve a weighed quantity of Cream in *Mobile phase*, and sonicate in a water bath at 40°–45° until the sample is completely dispersed. Cool the solution to below room temperature, and pass through a 0.45- μ m Teflon filter into an HPLC vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm \times 25-cm; packing L11

Column temperature: 45°

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 13 between miconazole nitrate and benzoic acid

Column efficiency: NLT 7500 theoretical plates for the miconazole nitrate peak

Tailing factor: NMT 2.0 for the miconazole nitrate peak

Relative standard deviation: NMT 2.0% from the miconazole nitrate peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Miconazole Nitrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of miconazole nitrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- MINIMUM FILL (755):** Meets the requirements

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, and store at controlled room temperature.
- LABELING:** Cream that is packaged and labeled for use as a vaginal preparation shall be labeled Miconazole Nitrate Vaginal Cream.
- USP REFERENCE STANDARDS (11)**
USP Miconazole Nitrate RS

Miconazole Nitrate Topical Powder**DEFINITION**

Miconazole Nitrate Topical Powder contains NLT 90.0% and NMT 110.0% of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

IDENTIFICATION

- A.**

Sample: Transfer nominally 100 mg of miconazole nitrate from Topical Powder to a 50-mL beaker, disperse in 40 mL of methanol, and mix for a minimum of 5 min. Allow to settle for 5–10 min, and filter into a 100-mL beaker. Evaporate on a steam bath to dryness. Dry the residue at 105° for 10 min.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue obtained from the *Sample* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Miconazole Nitrate RS.

ASSAY• **PROCEDURE**

Internal standard solution: 0.5 mg/mL of cholestane in chloroform

Standard solution: 2 mg/mL of USP Miconazole Nitrate RS prepared as follows. Transfer 5.0 mL of 0.8 mg/mL of USP Miconazole Nitrate RS in a mixture of chloroform and methanol (1:1) to a test tube, and add 2.0 mL of *Internal standard solution*. Evaporate to dryness at a temperature not higher than 40° with the aid of a current of nitrogen. Dissolve the residue in 2.0 mL of a mixture of chloroform and methanol (1:1).

Sample solution: Nominally 2 mg/mL of miconazole nitrate prepared as follows. Transfer an equivalent to 20 mg of miconazole nitrate from Topical Powder to a 50-mL centrifuge tube. Add 25.0 mL of methanol, and shake by mechanical means for 30 min to dissolve the miconazole nitrate. Centrifuge to obtain a clear supernatant. Transfer 5.0 mL of this solution to a test tube, add 2.0 mL of *Internal standard solution*, and evaporate to dryness at a temperature not higher than 40° with the aid of a current of nitrogen. Dissolve the residue in 2.0 mL of a mixture of chloroform and methanol (1:1).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.2-m glass; packed with 3% phase G32 on support S1A

Temperatures

Sample: *Standard solution*

[NOTE—The relative retention times for cholestane and miconazole nitrate are 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the cholestane and miconazole nitrate peaks

Relative standard deviation: NMT 3.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) in the portion of Topical Powder taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of miconazole nitrate to cholestane from the *Sample solution*

R_S = peak response ratio of miconazole nitrate to cholestane from the *Standard solution*

C_S = concentration of USP Miconazole Nitrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of miconazole nitrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **MINIMUM FILL** (755): Meets the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total count does not exceed 10^2 cfu/g. It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Miconazole Nitrate RS

Miconazole Nitrate Vaginal Suppositories**DEFINITION**

Miconazole Nitrate Vaginal Suppositories contain NLT 90.0% and NMT 110.0% of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

IDENTIFICATION• **A.**

Sample: Place a portion of the *Sample stock solution* prepared as directed in the *Assay*, containing about 25 mg of miconazole nitrate, in a 50-mL beaker. Evaporate on a steam bath to dryness with the aid of a current of filtered air. Dry the residue at 105° for 10 min.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue obtained from the *Sample* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Miconazole Nitrate RS.

ASSAY• **PROCEDURE**

Internal standard solution: 1 mg/mL of cholestane in a mixture of chloroform and methanol (1:1)

Standard solution: 2.5 mg/mL of USP Miconazole Nitrate RS prepared as follows. Transfer a 10.0-mL aliquot of a solution containing 500 µg/mL of USP Miconazole Nitrate RS in methanol to a test tube, and evaporate on a steam bath to dryness with the aid of a current of filtered air. Dissolve the residue in 2.0 mL of *Internal standard solution*.

Sample stock solution: Nominally 2.5 mg/mL of miconazole nitrate prepared as follows. Transfer 1 Suppository to a stoppered, 50-mL centrifuge tube. Add 30 mL of pentane, and shake by mechanical means for 20 min to dissolve the suppository base and to disperse the miconazole nitrate. Centrifuge to obtain a clear supernatant. Aspirate, and discard the clear liquid. Wash the residue with three 20-mL portions of pentane, shaking, centrifuging, and aspirating in the same manner. Discard the pentane washings. Evaporate the residual pentane from the residue with the aid of a current of filtered air. Using small portions of methanol, transfer the residue to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume.

Sample solution: Transfer an aliquot containing nominally the equivalent to 5 mg of miconazole nitrate from the *Sample stock solution* to a suitable container, and evaporate on a steam bath to dryness with the aid of a current of filtered air. Dissolve the residue in 2.0 mL of *Internal standard solution*.

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Midazolam RS

Midazolam Injection

DEFINITION

Midazolam Injection is a sterile solution of Midazolam Hydrochloride in Water for Injection or of Midazolam in Water for Injection prepared with the aid of Hydrochloric Acid. It contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of midazolam ($C_{18}H_{13}ClFN_3$). It may contain Sodium Chloride, Benzyl Alcohol, and/or a chelating agent.

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

[NOTE—Protect all prepared Standard and sample solutions from light.]

PROCEDURE

Buffer: 6.7 g/L of dibasic sodium phosphate heptahydrate in water. Adjust with phosphoric acid to a pH of 5.0 ± 0.1 .

Solution A: Prepare a filtered and degassed mixture of acetonitrile, methanol and *Buffer* (8:3:9).

Solution B: Acetonitrile and *Buffer* (3:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
20	0	100
35	0	100
37	100	0
45	100	0

Standard solution: Dissolve USP Midazolam RS in about 2 mL of methanol, and dilute quantitatively, and stepwise if necessary, with *Solution A* to obtain a 0.2-mg/mL solution.

Sample solution: [NOTE—The midazolam present in the Injection converts from the open-ring form to the closed-ring form when diluted with *Solution A*. The midazolam potency is determined based on the peak area of the closed-ring form. It takes approximately 60 min at 40° or 2–3 h at room temperature to complete the conversion. The *Standard solution* is not subject to this conversion process.] Transfer a volume of Injection to a suitable volumetric flask, and dilute with *Solution A* to obtain a solution containing about 0.2 mg/mL of midazolam. Transfer the resulting solution into suitable crimp top vials, seal tightly, and heat at about 40° for 60 min. Allow this solution to cool to room temperature before injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 1.0 mL/min

Injection size: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 5500 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of labeled amount of $C_{18}H_{13}ClFN_3$ in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Midazolam RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of Midazolam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Organic Impurities

[NOTE—Protect all prepared Standard and sample solutions from light.]

PROCEDURE

Buffer, Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution: Use *Standard solution* in the *Assay*.

Standard solution: 0.5 μ g/mL USP Midazolam RS in *Solution A* from *Standard stock solution*

Control solution: 0.1 μ g/mL USP Midazolam RS in *Solution A* from *Standard solution*

System suitability

Samples: *Standard solution* and *Control solution*

Suitability requirements

Tailing factor: NMT 2.5 for midazolam peak, *Standard solution*

Column efficiency: NLT 5500 theoretical plates, *Standard solution*

Signal-to-noise ratio: NLT 10, *Control solution*

Relative standard deviation: NMT 8.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of the individual impurity from the *Sample solution*

r_s = peak response of midazolam from the *Standard solution*

C_s = concentration of USP Midazolam RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of Midazolam in the *Sample solution* (mg/mL)

F = relative response factor; 0.51 for the peak eluting at a relative retention between 0.79 and 0.97 with respect to midazolam; 1.0 for all other peaks

Acceptance criteria

Individual known impurity: NMT 0.5%

Individual unknown impurity: NMT 0.1%

Total impurities: NMT 1.0%

[NOTE—Disregard all solvent- and excipient-related peaks.]

SPECIFIC TESTS**• BENZYL ALCOHOL CONTENT** (if present)

Buffer: 3.4 g/L of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Acetonitrile and *Buffer* (7:13)

System suitability solution: 0.05 mg/mL of USP Midazolam RS and 0.5 mg/mL of USP Benzyl Alcohol RS in *Mobile phase*

Standard solution: 0.5 mg/mL of USP Benzyl Alcohol RS in *Mobile phase*

Sample solution: Transfer a measured volume of Injection to a suitable volumetric flask. Dilute with *Mobile phase* to obtain a concentration of about 0.5 mg/mL of benzyl alcohol, based on the labeled content of benzyl alcohol in the Injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; L1 packing

Flow rate: 1.0 mL/min

Injection size: 50 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 6.0 between benzyl alcohol and midazolam

Tailing factor: NMT 2.0 for benzyl alcohol

Relative standard deviation: NMT 2.0% for benzyl alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benzyl alcohol in the volume of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of benzyl alcohol from the *Sample solution*

r_s = peak response of benzyl alcohol from the *Standard solution*

C_s = concentration of USP Benzyl Alcohol RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of benzyl alcohol in the *Sample solution* (mg/mL)

Acceptance criteria: The content of benzyl alcohol meets the requirements in *Injections and Implanted Drug Products* (1), *Specific Tests*, *Vehicles and added substances*.

• **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections

• **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 8.33 USP Endotoxin Units/mg of midazolam.

• **PH** (791): 2.5–3.7

• **STERILITY TESTS** (71): Meets the requirements

• **OTHER REQUIREMENTS:** It meets the requirements for *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type 1 glass. Store between 15° and 30°.

• **LABELING:** Label to indicate the vehicle used and the names and concentrations of any added preservatives. Indicate if the product is preservative free.

• **USP REFERENCE STANDARDS** (11)

• ORGANIC IMPURITIES

Buffer: To 2.7 g of dibasic potassium phosphate in 800 mL of water add 2.4 mL of triethylamine, and adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Acetonitrile and *Buffer* (200:800)

System suitability stock solution: 0.2 mg/mL of USP Milrinone Related Compound A RS in *Mobile phase*.

Heat in a water bath at approximately 80°, and/or sonicate if necessary to dissolve.

Standard stock solution: 2 mg/mL of USP Milrinone RS in *Mobile phase*. Heat in a water bath at approximately 80°, and/or sonicate if necessary to dissolve.

System suitability solution: 10.0 mL of *System suitability stock solution* and 1.0 mL of *Standard stock solution* in a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

Standard solution: 0.006 mg/mL of USP Milrinone RS, from the *Standard stock solution*, in *Mobile phase*

Sample solution: 2 mg/mL of Milrinone in *Mobile phase*. Heat in a water bath at approximately 80°, if necessary to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; packing L7

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for milrinone related compound A and milrinone are 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between milrinone related compound A and milrinone

Relative standard deviation: NMT 5.0% from the milrinone peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Milrinone taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak response of each impurity from the *Sample solution*
 r_s = peak response of milrinone from the *Standard solution*
 C_s = concentration of USP Milrinone RS in the *Standard solution* (mg/mL)
 C_u = concentration of Milrinone in the *Sample solution* (mg/mL)

Acceptance criteria

Any individual impurity: NMT 0.3%
 Total impurities: NMT 1.0%

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
 - USP Milrinone RS
 - USP Milrinone Related Compound A RS
 - 1,6-Dihydro-2-methyl-6-oxo-(3,4'-bipyridine)-5-carboxamide.
 - $C_{12}H_{11}N_3O_2$ 229.23

Mineral Oil

DEFINITION

Mineral Oil is a purified mixture of liquid hydrocarbons obtained from petroleum. It may contain a suitable stabilizer.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197F)**
- **B.** It meets the requirements in *Specific Tests for Viscosity—Capillary Methods* (911).

IMPURITIES

- **LIMIT OF POLYCYCLIC AROMATIC HYDROCARBONS**

Dimethyl sulfoxide: Use spectrophotometric grade dimethyl sulfoxide.

n-Hexane: Use n-hexane that has been washed by being shaken previously twice with one-fifth its volume of *Dimethyl sulfoxide*.

Standard solution: 7.0 µg/mL of USP Naphthalene RS in isooctane (2,2,4-trimethylpentane)

Standard blank: 2,2,4-Trimethylpentane

Sample solution: Transfer 25.0 mL of Mineral Oil and 25 mL of n-Hexane to a 125-mL separator, and mix.
 [NOTE—Use no lubricants other than water on the stopcock, or use a separator equipped with a suitable polymeric stopcock.]

Add 5.0 mL of *Dimethyl sulfoxide*, and shake the mixture vigorously for 1 min. Allow to stand until the lower layer is clear, transfer the lower layer to another 125-mL separator, add 2 mL of n-Hexane, and shake vigorously. Use the lower layer.

Sample blank: *Dimethyl sulfoxide* that has been shaken previously vigorously for 1 min with n-Hexane in the ratio of 5 mL of *Dimethyl sulfoxide* to 25 mL of n-Hexane

Instrumental conditions

Mode: UV

Analytical wavelengths

Standard solution: 275 nm

Sample solution: 260–350 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Standard blank*, *Sample solution*, and *Sample blank*

Acceptance criteria: The absorbance at any wavelength in the specified range of the *Sample solution* is NMT one-third of the absorbance of the *Standard solution*.

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.845–0.905
- **VISCOSITY—CAPILLARY METHODS (911):** 34.5–150.0 mm²·s⁻¹ for kinematic viscosity, measured with a capillary viscometer at 40 ± 0.1°
- **ACIDITY**

Sample: 10 mL

Analysis: Add 20 mL of boiling water to the *Sample*, and shake vigorously for about 1 min. Allow to cool, and draw off the separated water. To 10 mL of the filtered aqueous layer add 0.1 mL of phenolphthalein TS.

Acceptance criteria: The solution does not produce a pink color. NMT 1.0 mL of 0.01 N sodium hydroxide is required to produce a pink color.
- **READILY CARBONIZABLE SUBSTANCES TEST (271)**

Sample: 5 mL

Standard solution: In a glass-stoppered test tube that previously has been rinsed with hot nitric acid (see *Cleaning Glass Apparatus* (1051)), mix 3 mL of ferric chloride CS, 1.5 mL of cobaltous chloride CS, and 0.5 mL of cupric sulfate CS then overlaid with 5 mL of Mineral Oil.

Analysis: Place the *Sample* in a glass-stoppered test tube that previously has been rinsed with hot nitric acid (see *Cleaning Glass Apparatus* (1051)), then rinsed with water, and dried. Add 5 mL of sulfuric acid containing 94.5%–94.9% of H₂SO₄, and heat in a boiling water bath for 10 min. After the test tube has been in the bath for 30 s, remove it quickly, and while holding the stopper in place, give three vigorous, vertical shakes over an amplitude of about 5 in. Repeat every 30 s. Do not keep the test tube out of the bath longer than 3 s for each shaking period. At the end of 10 min from the time when first placed in the water bath, remove the test tube.

Acceptance criteria: The oil portion of the *Sample* may turn hazy, but it remains colorless or shows a slight pink or yellow color, and the acid portion of the *Sample* does not become darker than the *Standard solution*.
- **SOLID PARAFFIN**

Sample: Mineral Oil that has been dried previously in a beaker at 105° for 2 h and cooled to room temperature in a desiccator over silica gel

Analysis: Fill a tall, cylindrical, standard oil-sample bottle of colorless glass of 120-mL capacity with the *Sample*, insert the stopper, and immerse in an ice bath for 4 h.

Acceptance criteria: The *Sample* is sufficiently clear that a black line 0.5 mm in width, on a white background, held vertically behind the bottle, is clearly visible.
- **LIMIT OF SULFUR COMPOUNDS**

Solution A: Saturated solution of lead(II) oxide in sodium hydroxide (200 mg/mL)

Sample: 4.0 mL

Analysis: Combine the *Sample*, 2 mL of dehydrated alcohol, and 2 drops of *Solution A*, heat at 70° for 10 min with frequent shaking, and cool.

Acceptance criteria: No dark brown color develops.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements specified.
- **LABELING:** Label it to indicate the name and quantity of any substance added as a stabilizer.
- **USP REFERENCE STANDARDS (11)**
USP Mineral Oil RS
USP Naphthalene RS

Mineral Oil Emulsion

DEFINITION

Prepare Mineral Oil Emulsion as follows.

Mineral Oil	500 mL
Acacia, in very fine powder	125 g
Syrup	100 mL
Vanillin	40 mg
Alcohol	60 mL
Purified Water, a sufficient quantity to make	1000 mL

Mix the *Mineral Oil* with the *Acacia* in a dry mortar. Add 250 mL of *Purified Water* all at once, and emulsify the mixture. Add, in divided portions, triturating after each addition, a mixture of the *Syrup*, 50 mL of *Purified Water*, and *Vanillin* dissolved in *Alcohol*. Add *Purified Water* to bring the preparation to final volume, and mix.

The *Vanillin* may be replaced by NMT 1% of any other official flavoring substance or any mixture of official flavoring substances. *Alcohol* may be replaced with 60 mL of sweet orange peel tincture or 2 g of benzoic acid as a preservative.

SPECIFIC TESTS

- **ALCOHOL DETERMINATION, Method I (611):** 4.0%–6.0% of C_2H_5OH

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers.

Mineral Oil, Rectal

DEFINITION

Mineral Oil, Rectal, is Mineral Oil that has been suitably packaged.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197F)**
- **B.** It meets the requirements in *Specific Tests for Viscosity—Capillary Methods (911)*.

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.845–0.905
- **VISCOSITY—CAPILLARY METHODS (911):** 34.5–150.0 $mm^2 \cdot s^{-1}$ for kinematic viscosity, measured with a capillary viscometer at $40 \pm 0.1^\circ$
- **ACIDITY**
Sample: 10 mL
Analysis: Add 20 mL of boiling water to the *Sample*, and shake vigorously for about 1 min. Allow to cool, and draw off the separated water. To 10 mL of the filtered aqueous layer add 0.1 mL of phenolphthalein TS.

Acceptance criteria: The solution does not produce a pink color. NMT 1.0 mL of 0.01 N sodium hydroxide is required to produce a pink color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, single-unit containers. No storage requirements specified.
- **USP REFERENCE STANDARDS (11)**
USP Mineral Oil RS

Topical Light Mineral Oil

DEFINITION

Topical Light Mineral Oil is Light Mineral Oil that has been suitably packaged.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197F)**
- **B.** It meets the requirements in *Specific Tests for Viscosity—Capillary Methods (911)*.

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.818–0.880
- **VISCOSITY—CAPILLARY METHODS (911):** 3.0–34.4 $mm^2 \cdot s^{-1}$ for kinematic viscosity, measured with a capillary viscometer at $40 \pm 0.1^\circ$
- **ACIDITY**
Sample: 10 mL
Analysis: Add 20 mL of boiling water to the *Sample*, and shake vigorously for about 1 min. Allow to cool, and draw off the separated water. To 10 mL of the filtered aqueous layer add 0.1 mL of phenolphthalein TS.
Acceptance criteria: The solution does not produce a pink color. NMT 1.0 mL of 0.01 N sodium hydroxide is required to produce a pink color.
- **SOLID PARAFFIN**
Sample: Topical Light Mineral Oil that has been dried previously in a beaker at 105° for 2 h and cooled to room temperature in a desiccator over silica gel
Analysis: Fill a tall, cylindrical, standard oil-sample bottle of colorless glass of 120-mL capacity with the *Sample*. Insert the stopper, and immerse the bottle in a mixture of ice and water for 4 h.
Acceptance criteria: The *Sample solution* is sufficiently clear that a black line 0.5 mm in width, on a white background, held vertically behind the bottle, is clearly visible.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements specified.
- **LABELING:** Label it to indicate the name and quantity of any substance added as a stabilizer, and label packages intended for direct use by the public to indicate that it is not intended for internal use.
- **USP REFERENCE STANDARDS (11)**
USP Mineral Oil RS

Minocycline for Injection

DEFINITION

Minocycline for Injection is sterile, freeze-dried Minocycline Hydrochloride suitable for parenteral use. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of minocycline ($C_{23}H_{27}N_3O_7$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Mobile phase: Dimethylformamide, tetrahydrofuran, 0.2 M ammonium oxalate, and 0.01 M edetate disodium (120:80:600:180). Adjust with ammonium hydroxide to a pH of 7.2.

System suitability solution: Dissolve 10 mg of USP Minocycline Hydrochloride RS in 20 mL of 0.2 M ammonium oxalate. Heat on a water bath at 60° for 3 h, allow to cool, and dilute with water to 25.0 mL.

Standard solution: 0.5 mg/mL of minocycline from USP Minocycline Hydrochloride RS in water. Use this solution within 3 h.

Sample solution 1 (where it is represented as being in a single-dose container): Nominally 0.5 mg/mL of minocycline, prepared as follows. Constitute Minocycline for Injection in a volume of water, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a hypodermic needle and syringe, and dilute with water.

Sample solution 2 (where the label states the quantity of minocycline in a given volume of constituted solution): Nominally 0.5 mg/mL of minocycline, prepared as follows. Constitute Minocycline for Injection in a volume of water, corresponding to the volume of solvent specified in the labeling. Dilute a portion of constituted solution with water.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for epiminocycline and minocycline are 0.7 and 1.0, respectively.]

Suitability requirements

Capacity factor: 5.0–11.5, Standard solution

Resolution: NLT 4.6 between epiminocycline and minocycline, System suitability solution

Tailing factor: 0.9–2.0 for minocycline, Standard solution

Relative standard deviation: NMT 2.0%, Standard solution

Analysis

Samples: Standard solution, and Sample solution 1 or Sample solution 2

Calculate the percentage of the labeled amount of minocycline (C₂₃H₂₇N₃O₇) in the container, or in the portion of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response from Sample solution 1 or Sample solution 2

r_S = peak response from the Standard solution

C_S = concentration of USP Minocycline Hydrochloride RS in the Standard solution (mg/mL)

C_U = nominal concentration of Sample solution 1 or Sample solution 2 (mg/mL)

P = potency of minocycline in USP Minocycline Hydrochloride RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

IMPURITIES**• LIMIT OF EPIMINOCYCLINE**

Mobile phase, System suitability solution, Standard solution, Sample solution 1 or Sample solution 2, Chromatographic system, and System suitability: Proceed as directed in the Assay.

[NOTE—The relative retention times for epiminocycline and minocycline are 0.7 and 1.0, respectively.]

Analysis: Calculate the percentage of epiminocycline in the portion of Minocycline for Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of epiminocycline from Sample solution 1 or Sample solution 2

r_T = total area of all the peaks from Sample solution 1 or Sample solution 2

Acceptance criteria: NMT 6.0%

SPECIFIC TESTS**• pH (791)**

Sample solution: Nominally 10 mg/mL of minocycline

Acceptance criteria: 2.0–3.5

• WATER DETERMINATION, Method I (921)

Calculate the percentage of the labeled amount of minocycline ($C_{23}H_{27}N_3O_7$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Minocycline Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of minocycline in the *Sample solution* (mg/mL)
 P = potency of minocycline in USP Minocycline Hydrochloride RS ($\mu\text{g}/\text{mg}$)
 F = conversion factor, 0.001 mg/ μg
 Acceptance criteria: 90.0%–130.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905)
For single-unit containers
Acceptance criteria: Meets the requirements
- **DELIVERABLE VOLUME** (698): Meets the requirements

SPECIFIC TESTS

- **PH** (791): 7.0–9.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Minocycline Hydrochloride RS

Minocycline Hydrochloride Tablets

DEFINITION

Minocycline Hydrochloride Tablets contain the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of minocycline ($\text{C}_{23}\text{H}_{27}\text{N}_3\text{O}_7$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY• **PROCEDURE**

Mobile phase: Dimethylformamide, tetrahydrofuran, 0.2 M ammonium oxalate, and 0.01 M edetate disodium (120:80:600:180). Adjust with ammonium hydroxide to a pH of 7.2.

System suitability solution: Dissolve 10 mg of USP Minocycline Hydrochloride RS in 20 mL of 0.2 M ammonium oxalate. Heat on a water bath at 60° for 3 h, allow to cool, and dilute with water to 25.0 mL.

Standard solution: 0.5 mg/mL of minocycline from USP Minocycline Hydrochloride RS in water. Use this solution within 3 h.

Sample solution: Nominally 0.5 mg/mL of minocycline from NLT 20 finely powdered Tablets in water. Shake for 1 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for epiminocycline and minocycline are 0.7 and 1.0, respectively.]

Suitability requirements

Capacity factor: 5.0–11.5, *Standard solution*

Resolution: NLT 4.6 between epiminocycline and minocycline, *System suitability solution*

Tailing factor: 0.9–2.0 for minocycline, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of minocycline ($\text{C}_{23}\text{H}_{27}\text{N}_3\text{O}_7$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Minocycline Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the *Sample solution* (mg/mL)
 P = potency of minocycline in USP Minocycline Hydrochloride RS ($\mu\text{g}/\text{mg}$)
 F = conversion factor, 0.001 mg/ μg
 Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Detector: UV maximum at about 348 nm

Standard solution: USP Minocycline Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of minocycline ($\text{C}_{23}\text{H}_{27}\text{N}_3\text{O}_7$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921): NMT 12.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Minocycline Hydrochloride RS

Minocycline Hydrochloride Extended-Release Tablets

DEFINITION

Minocycline Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of minocycline ($\text{C}_{23}\text{H}_{27}\text{N}_3\text{O}_7$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B.** The UV absorption spectrum of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the Assay.

ASSAY• **PROCEDURE**

Protect solutions containing minocycline from light.

Buffer: 3.5 g/L of tetrabutylammonium hydrogen sulfate, 2 g/L of anhydrous citric acid, and 6.8 g/L of monobasic potassium phosphate. Adjust with 10 N sodium hydroxide to a pH of 7.0.

Mobile phase: Acetonitrile and Buffer (24:76)

Diluent: Acetonitrile and water (20:80)

Standard solution: 0.045 mg/mL of minocycline from USP Minocycline Hydrochloride RS in *Diluent*. Store at 4° and use within 24 h.

Sample stock solution: Nominally about 0.9 mg/mL of minocycline from Tablets prepared as follows. Transfer a suitable portion of finely powdered Tablets (NLT 10) to a suitable volumetric flask. Add acetonitrile, using 20% of the final volume, and mix vigorously for 15 min. Add water, using 65% of the final volume, and mix vigorously for 30 min. Dilute with water to volume and mix.

Sample solution: Nominally 0.045 mg/mL of minocycline from *Sample stock solution* in *Diluent*. Centrifuge and use the clear supernatant. Store at 4° and use within 24 h.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 277 nm. When this procedure is used for *Identification test B*, use a diode-array detector set at 200–400 nm.

Column: 4.6-mm × 15-cm; 5-μm packing L1

Temperatures

Column: 35°

Autosampler: 4°

Flow rate: 1.3 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of minocycline ($C_{23}H_{27}N_3O_7$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Minocycline Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of minocycline in the *Sample solution* (mg/mL)

P = potency of minocycline in USP Minocycline Hydrochloride RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Protect solutions containing minocycline from light.

Medium: pH 6.8 phosphate buffer; 900 mL

Apparatus 2: 50 rpm

Times: 1, 2, and 5 h

Standard stock solution: 0.5 mg/mL of minocycline from USP Minocycline Hydrochloride RS in *Medium*

Standard solution: ($L/900$) mg/mL of minocycline from *Standard stock solution* in *Medium*, where L is the label claim of minocycline in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

Mode: UV

Analytical wavelength: 348 nm

Cell: See Table 1.

Table 1

Tablet Strength (mg)	Cell Path Length (cm)
45	0.5
90	0.2
135	0.2

Blank: *Medium*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Autozero the instrument using the *Blank*.

Calculate the concentration (C_i) of minocycline ($C_{23}H_{27}N_3O_7$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result} = (A_u/A_s) \times C_s \times P \times F$$

A_u = absorbance of the *Sample solution* at time point i

A_s = absorbance of the *Standard solution*

C_s = concentration of the *Standard solution* (mg/mL)

P = potency of minocycline in USP Minocycline Hydrochloride RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Calculate the percentage of the labeled amount (Q_i) of minocycline ($C_{23}H_{27}N_3O_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_5)] + (C_1 \times V_5)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_5)]] + [(C_2 + C_1) \times V_5]\} \times (1/L) \times 100$$

C_i = concentration of minocycline in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_5 = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See Table 2.

Table 2

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	20–45
2	2	40–70
3	5	NLT 85

The percentages of the labeled amounts of minocycline ($C_{23}H_{27}N_3O_7$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 2

If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Protect solutions containing minocycline from light.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Times: 1, 2, and 4 h

Standard solution: 0.0225 mg/mL of minocycline from USP Minocycline Hydrochloride RS in *Medium*

Sample solution: At the times specified, withdraw 10 mL of the solution under test and replace with 10 mL of *Medium*. Pass through a suitable filter. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV
 Analytical wavelength: 348 nm
 Cell: 1 cm
 Blank: Medium

Analysis

Samples: *Standard solution* and *Sample solution*
 Autozero the instrument using the *Blank*.
 Calculate the concentration (C_i) of minocycline ($C_{23}H_{27}N_3O_7$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result} = (A_U/A_S) \times C_S \times D \times P \times F$$

A_U = absorbance of the *Sample solution* at time point i
 A_S = absorbance of the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)
 D = dilution factor (mL/mL)
 P = potency of minocycline in USP Minocycline Hydrochloride RS ($\mu\text{g}/\text{mg}$)
 F = conversion factor, 0.001 mg/ μg
 Calculate the percentage of the labeled amount (Q_i) of minocycline ($C_{23}H_{27}N_3O_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

C_i = concentration of minocycline in the portion of sample withdrawn at the specified time point (mg/mL)
 V = volume of *Medium*, 900 mL
 L = label claim (mg/Tablet)
 V_3 = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See Table 3.

Table 3

Time Point (i)	Time (h)	Amount Dissolved (%)	
		45 mg/Tablet	90 mg/Tablet and 135 mg/Tablet
1	1	40–60	40–60

- **PACKAGING AND STORAGE:** Store in tightly closed containers at controlled room temperature.

- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
USP Minocycline Hydrochloride RS

Minocycline Periodontal System

DEFINITION

Minocycline Periodontal System is an extended-release formulation of Minocycline Hydrochloride containing the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of minocycline ($C_{23}H_{27}N_3O_7$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION (197U)**
Wavelength range: 250–450 nm
Standard stock solution: Transfer USP Minocycline Hydrochloride RS to a suitable volumetric flask. Dissolve first in dimethylformamide, using about 20% of the final volume, then dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.48 mg/mL of minocycline.
Standard solution: 0.024 mg/mL minocycline hydrochloride from *Standard stock solution* in water
Sample stock solution: Transfer Minocycline Periodontal System equivalent to 12 mg of minocycline hydrochloride to a 25-mL volumetric flask. Add 5.0 mL of dimethylformamide, and mix to dissolve. Dilute with water to volume and filter.
Sample solution: 0.024 mg/mL minocycline hydrochloride from *Sample stock solution* in water
Acceptance criteria: The *Sample solution* exhibits maxima at the same wavelengths as the *Standard solution*, concomitantly measured.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Dimethylformamide, 0.2 M ammonium oxalate, and 0.1 M edetate disodium (25:55:20), adjusted with 0.4 M aqueous tetrabutylammonium hydroxide solution to a pH of 6.3 ± 0.2
Diluent: Dimethylformamide and methanol (1:1)
System suitability solution: Prepare a solution in water containing 2 mg/mL USP Minocycline Hydrochloride RS. Heat over a steam bath for 60 min. To one part of this solution add four parts of *Mobile phase* and mix. Refrigerate the solution immediately after preparation and during analysis, using a refrigerated autosampler.
Standard solution: 0.4 mg/mL of minocycline from USP Minocycline Hydrochloride RS in *Diluent*. Refrigerate the solution immediately after preparation and during analysis, using a refrigerated autosampler. [NOTE—Use low-actinic glassware.]
Sample solution: Mix the contents of NLT 10 dispensing units of Minocycline Periodontal System. Transfer a portion of the mixture, equivalent to 10 mg of minocycline, into a 25-mL volumetric flask. Add *Diluent* and sonicate for 2–5 min, or until the sample is dissolved. Dilute with *Diluent* to volume, and mix to obtain a solution having a nominal concentration of 0.4 mg/mL of minocycline, based on the label claim. Refrigerate the solution immediately after preparation and during analysis, using a refrigerated autosampler. [NOTE—Use low-actinic glassware.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC
Detector: UV 280 nm
Guard column: 4.6-mm \times 3-cm; 10- μ m packing L7
Column: 4.6-mm \times 15-cm; 5- μ m packing L7
Flow rate: 2 mL/min
Autosampler temperature: 5°
Injection size: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times of epiminocycline and minocycline are 0.81 and 1, respectively.]

Suitability requirements

Resolution: NLT 2.0 between epiminocycline and minocycline, *System suitability solution*

Tailing factor: NMT 2.0 for the minocycline peak, *System suitability solution*

Relative standard deviation: NMT 2.0% for the minocycline peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of minocycline ($C_{23}H_{27}N_3O_7$) in the portion of the Minocycline Periodontal System taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of minocycline from the *Sample solution*

r_S = peak response of minocycline from the *Standard solution*

C_S = concentration of USP Minocycline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of minocycline in the *Sample solution* (mg/mL)

P = potency of minocycline in USP Minocycline Hydrochloride RS (μ g/mg)

F = conversion factor, 0.001 mg/ μ g

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

DISSOLUTION

Medium: 6.9 g/L of monobasic sodium phosphate monohydrate in water, adjusted with phosphoric acid to a pH of 4.2. This solution is stable for 10 days.

Apparatus: Tube rotator. [NOTE—Suitable equipment is available as Labquake® tube rotator, catalog number 400110.]

0.1 M Edetate disodium: 37.2 g/L of edetate disodium in water

0.2 M Ammonium oxalate: 28.4 g/L of ammonium oxalate in water

Mobile phase: Mix 310 mL of 0.1 M *Edetate disodium* and 500 mL of 0.2 M *Ammonium oxalate*, adjust with 0.4 M aqueous tetrabutylammonium hydroxide to a pH of 6.2, and add 175 mL of dimethylformamide. The injector wash solution is a mixture of dimethylformamide and water (25:75).

Standard stock solution: 0.11 mg/mL of USP Minocycline Hydrochloride RS in *Medium*

Standard solutions: Dilute the *Standard stock solution* with *Medium* to obtain solutions with final concentrations of 0.088 mg/mL, 0.0528 mg/mL, 0.0352 mg/mL, 0.022 mg/mL, and 0.0176 mg/mL.

System suitability solution: Transfer 10 mg of USP Minocycline Hydrochloride RS to a 50-mL beaker. Add 5 mL of water and heat on a steam bath for 60 min. Add 20 mL of *Medium* or *Mobile phase*, and mix well. Store at 5°.

Sample solution: Use borosilicate glass tubes, 25 mm outside diameter and 15 cm long. Close the tubes with a snap type cell with a Teflon prong consisting of a

Teflon closure and holder that snap together, two 25- μ m stainless steel screens, two silicone gaskets, and a Teflon spacer (see Figure 1). Prepare six tubes as follows: partially assemble a release tube and tare its weight; dispense one dose of Minocycline Periodontal System into a partially assembled release cell (see Figure 1); record the sample weight in mg; assemble the cell so that the sample is enclosed between the two 25- μ m screens; close the cells and place each one of them into separate glass tubes containing 10 mL of *Medium* previously equilibrated at 37°; add the Teflon prong, and cap the tube with Teflon faced rubber-lined caps; seal with Teflon tape. Place the tubes in the tube rotator. Place the tube rotator in a convection incubator that is maintained at 37°. Allow the tubes to rotate for 4 h. Remove the solution under test, and add 10 mL of *Medium* previously equilibrated at 37°. Replace the tubes in the apparatus and rotate for 20 h (24 h total). Repeat the sampling procedure after 24 h (48 h total), and after another 24 h (72 h total).

Teflon Release Container

Figure 1. Sample Extraction Configuration

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Guard column: 4.6-mm \times 3-cm; 10- μ m packing L7

Column: 4.6-mm \times 3.3-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Autosampler temperature: 5°

Injection size: 20 μ L for the 4 and 24 h time points;
50 μ L for the 48 and 72 h time points

Suitability requirements

Samples: *System suitability solution* and *Standard solutions*

Resolution: NLT 2.0 between epiminocycline and minocycline. Inject 20 μ L of the *System suitability solution*.

Tailing factor: NMT 2.0. Inject 20 μ L of the *System suitability solution*.

Relative standard deviation: NMT 2.0% for the minocycline peak, any of the *Standard solutions*

Analysis: Construct a calibration curve for each sampling interval by plotting the concentration of the *Standard solutions* versus peak area. Calculate the slopes and y-intercepts using linear regression analysis.

Calculate the release rate of minocycline:

$$\text{Result}_i = [(r_{ui} - y_i)/S_i] \times 10/(i \times W \times A)$$

- i = sampling time, 4, 24, 48, 72 h
- r_{ui} = peak response from each of the *Standard solutions* at time i
- y_i = y-intercept of the calibration curve at sampling time i
- S_i = slope of the calibration curve at sampling time i
- W = weight of the sample (mg)
- A = amount of minocycline in the sample (mg/mg of sample) as determined in the *Assay*

Tolerances

Time (h)	Release Rate (μ g/h) Average of 6 Measurements
0–4	NLT 25
4–24	NLT 1.0
24–48	NLT 0.2
48–72	NLT 0.05

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES**Organic Impurities****• PROCEDURE**

Mobile phase, Diluent, *System suitability solution*, *Standard solution*, *Sample solution*, *Chromatographic system*, and *System suitability*: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each related compound in the portion of Minocycline Periodontal System taken:

$$\text{Result} = (r_u/r_T) \times 100$$

r_u = peak response of each impurity from the *Sample solution*

r_T = sum of the peak responses from the *Sample solution*. [NOTE—Exclude peaks eluting in the solvent front.]

Acceptance criteria

Individual impurities: NMT 6.0% of epiminocycline

Total impurities (excluding epiminocycline): NMT 3.5%

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 5.0%

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED ORGANISMS** (62): The total aerobic microbial count does not exceed 1000 cfu/g; the total combined molds and yeasts count does not exceed 100 cfu/g; and the product meets the requirements of the test for the absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in a tight, light-resistant container. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Minocycline Hydrochloride RS

MinoxidilC₉H₁₅N₅O

209.25

2,4-Pyrimidinediamine, 6-(1-piperidinyl)-, 3-oxide;
2,4-Diamino-6-piperidinopyrimidine 3-oxide [38304-91-5].

DEFINITION

Minoxidil contains NLT 97.0% and NMT 103.0% of minoxidil ($C_9H_{15}N_5O$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M): Do not dry specimens.

ASSAY• **PROCEDURE**

Mobile phase: Methanol, glacial acetic acid, and water (700:10:300). Add 3.0 g/L of docusate sodium. Adjust with perchloric acid to a pH of 3.0.

Internal standard solution: 0.2 mg/mL of medroxyprogesterone acetate in *Mobile phase*

Standard solution: 0.25 mg/mL of USP Minoxidil RS in *Internal standard solution*

Sample solution: 0.25 mg/mL of Minoxidil in *Internal standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the internal standard and minoxidil are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the internal standard and minoxidil

Relative standard deviation: NMT 2.0% from NLT four replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of minoxidil ($C_9H_{15}N_5O$) in the portion of Minoxidil taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of minoxidil to the internal standard from the *Sample solution*

R_S = peak response ratio of minoxidil to the internal standard from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1-Jan-2018)

• **ORGANIC IMPURITIES**

Mobile phase and Chromatographic system: Proceed as directed in the *Assay*.

Sample solution: 0.25 mg/mL of Minoxidil in *Mobile phase*

Analysis

Sample: *Sample solution*

Calculate the total percentage of impurities in the portion of Minoxidil taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = sum of the peak responses of all impurities from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria: NMT 1.5%

SPECIFIC TESTS• **LOSS ON DRYING** (731)

Analysis: Dry a sample at 50° and at a pressure not exceeding 5 mm of mercury for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Minoxidil RS

Minoxidil Tablets**DEFINITION**

Minoxidil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of minoxidil ($C_9H_{15}N_5O$).

IDENTIFICATION• **INFRARED ABSORPTION**

Sample: Transfer a portion of finely powdered Tablets, equivalent to 10 mg of minoxidil, to a separator. Add 25 mL of water, and extract with three 15-mL portions of chloroform. Combine the chloroform extracts, and evaporate with the aid of a stream of nitrogen. Wash the inside of the container with 5 mL of alcohol, add 300 mg of potassium bromide, and evaporate under vacuum at 50° until dry.

Acceptance criteria: The IR absorption spectrum of the potassium bromide dispersion prepared from the *Sample* exhibits maxima at the same wavelengths as that of a similar preparation of USP Minoxidil RS.

ASSAY• **PROCEDURE**

Mobile phase: Methanol, glacial acetic acid, and water (70:1:30). Add 3.0 g/L of docusate sodium, and adjust with perchloric acid to a pH of 3.0.

Internal standard solution: 0.2 mg/mL of medroxyprogesterone acetate in *Mobile phase*

Standard solution: 0.25 mg/mL of USP Minoxidil RS in *Internal standard solution*

Sample solution: Nominally 0.25 mg/mL of minoxidil in *Internal standard solution*, prepared as follows.

Dissolve the equivalent to 5 mg of minoxidil, from powdered Tablets (NLT 10), in 20.0 mL of *Internal standard solution*, and shake for 5 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the internal standard and minoxidil are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the internal standard and minoxidil peaks

Relative standard deviation: NMT 2.0% from NLT four replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of minoxidil ($C_9H_{15}N_3O$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- R_U = peak response ratio of minoxidil to the internal standard from the *Sample solution*
 R_S = peak response ratio of minoxidil to the internal standard from the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)
 C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: pH 7.2 Phosphate Buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 1: 75 rpm

Time: 15 min

Spectrometric conditions

Mode: UV

Detector: UV 231 nm for Tablets containing up to 10 mg of minoxidil, and UV 287 nm for Tablets containing more than 10 mg of minoxidil

Standard solution: USP Minoxidil RS in *Medium*

Sample solution: Sample per *Dissolution (711)*. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of minoxidil ($C_9H_{15}N_3O$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Diluent: Methanol and water (50:50)

Mobile phase: Dissolve 2.0 g of sodium lauryl sulfate in a mixture of methanol, glacial acetic acid, and water (60:1:40). Adjust with perchloric acid to a pH of 3.0 ± 0.1 , and pass through a suitable filter of 0.45- μ m pore size.

Standard solution: 5 μ g/mL of USP Minoxidil RS in *Diluent*

Sample solution: Nominally equivalent to 0.25 mg/mL of minoxidil in *Diluent* from powdered tablets (NLT 20). Initially add *Diluent* to about 60% of the volume of the flask, shake on a mechanical shaker for 20 min, and then dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 15-cm; 3–10- μ m packing L1

Flow rate: 0.5 mL/min

Run time: NLT 3 times the retention time of the main peak

Injection volume: 40 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Sample solution* and *Standard solution*
Calculate the percentage of each individual impurity in the portion of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_U/C_S) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of minoxidil from the *Standard solution*

C_S = concentration of USP Minoxidil RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of minoxidil in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

 - Impurity E: 4-Methyl-1-(3-methylpyridin-2-yl)-2-phenylpiperazine.
 - Impurity F: 2-Methyl-1,2,3,4-tetrahydrobenzo[*c*]pyrazino[1,2-*a*]pyrido[3,2-*f*]azepin-10(14*bH*)-one.

Mirtazapine Tablets

DEFINITION

Mirtazapine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of mirtazapine ($C_{17}H_{19}N_3$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Extraction mixture: *n*-Hexane and water (1:1)

Sample: Transfer an amount equivalent to 30 mg of mirtazapine from finely powdered Tablets to a suitable centrifuge tube. Add *Extraction mixture* to obtain a solution of 1 mg/mL of mirtazapine in *n*-hexane. Shake for 5 min, and centrifuge. Decant, and evaporate the supernatant.

Standard: Dissolve USP Mirtazapine RS in *Extraction mixture* to obtain a solution having a concentration of about 1 mg/mL of mirtazapine in *n*-hexane. Shake for 5 min, and centrifuge. Decant, and evaporate the supernatant.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Diluent: Acetonitrile and water (1:1)

Buffer: Dissolve 18.0 g of tetramethylammonium hydroxide pentahydrate in 950 mL of water. Adjust with phosphoric acid to a pH of 7.4, and dilute with water to 1 L.

Mobile phase: Acetonitrile, methanol, tetrahydrofuran, and *Buffer* (15:12.5:7.5:65)

Standard solution: 0.3 mg/mL of USP Mirtazapine RS in *Diluent*

Sample solution: Nominally 0.3 mg/mL of mirtazapine (from an amount equivalent to the weight of 1 Tablet from NLT 20 finely powdered Tablets) in *Diluent*. Shake vigorously for 10 min, centrifuge an aliquot, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 7000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mirtazapine ($C_{17}H_{19}N_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Mirtazapine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 15 min

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

Standard solution: USP Mirtazapine RS in *Medium* in a concentration similar to the one expected in the *Sample solution*

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 315 nm

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of the labeled amount of mirtazapine ($C_{17}H_{19}N_3$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Mirtazapine RS in the *Standard solution* (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of mirtazapine ($C_{17}H_{19}N_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Diluent, Buffer, and Mobile phase: Proceed as directed in the *Assay*.

System suitability solution: 1.5 mg/mL of USP Mirtazapine Resolution Mixture RS in *Diluent*

Standard solution: 0.015 mg/mL of USP Mirtazapine RS in *Diluent*

Sample solution: 1.5 mg/mL of mirtazapine (from an amount equivalent to the weight of 1 Tablet from NLT 20 finely powdered Tablets) in *Diluent*. Shake vigorously for 10 min, centrifuge an aliquot, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Run time: 2 times the retention time of mirtazapine

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are listed in *Table 1*.]

Suitability requirements

Resolution: NLT 1.5 between acyclomirtazapine methyl derivative (impurity E) and 10-ketomirtazapine (impurity F), *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- r_U = peak response of any impurity from the *Sample solution*
 r_S = mirtazapine peak response from the *Standard solution*
 C_S = concentration of USP Mirtazapine RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the *Sample solution* (mg/mL)
 F = relative response factor for the corresponding impurity (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
 - USP Mirtazapine RS
 - USP Mirtazapine Resolution Mixture RS

This resolution mixture contains approximately 0.1% w/w of each of the following:

Impurity A: 1,2,3,4,10,14b-Hexahydro-2-methylpyrazino[2,1-*a*]pyrido[2,3-*c*] [2]benzazepine 2-oxide.

Impurity B: (2-(4-Methyl-2-phenylpiperazin-1-yl)pyridin-3-yl)methanol.

Impurity C: (2-Methyl-3,4,10,14b-tetrahydrobenzo[*c*]pyrazino[1,2-*a*]pyrido[3,2-*f*]azepin-1(2*H*)-one.

Impurity D: 1,2,3,4,10,14b-Hexahydropyrazino[2,1-*a*]pyrido[2,3-*c*] [2]benzazepine.

Impurity E: 4-Methyl-1-(3-methylpyridin-2-yl)-2-phenylpiperazine.

Impurity F: 2-Methyl-1,2,3,4-tetrahydrobenzo[*c*]pyrazino[1,2-*a*]pyrido[3,2-*f*]azepin-10(14*bH*)-one.

Mirtazapine Orally Disintegrating Tablets

DEFINITION

Mirtazapine Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of mirtazapine ($C_{17}H_{19}N_3$).

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

Standard solution: Dissolve 30 mg of USP Mirtazapine RS in a separatory funnel containing 30 mL of water, and add 30 mL of *n*-hexane. Shake vigorously for 5 min. Allow the solution to separate into two layers. Filter the *n*-hexane layer through glass wool, and evaporate to dryness.

Sample solution: Transfer a quantity of finely powdered Tablets, equivalent to 30 mg of mirtazapine, to a separatory funnel. Add 30 mL of water and 30 mL of *n*-hexane. Shake vigorously for 5 min. Allow the solution to separate into two layers. Filter the *n*-hexane layer through glass wool, and evaporate to dryness.

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Diluent: Acetonitrile and water (50:50)

Diluted phosphoric acid: Water and phosphoric acid (1000:3)

Buffer: Dissolve 1 g of monobasic potassium phosphate and 1.7 g of pentanesulfonic acid sodium salt in 1 L of water. Adjust with *Diluted phosphoric acid* to a pH of 4.7 ± 0.1, and filter.

Mobile phase: Acetonitrile and *Buffer* (25:75)

Standard stock solution: 0.3 mg/mL of USP

Mirtazapine RS in *Diluent*

Standard solution: 0.036 mg/mL of USP Mirtazapine RS in *Mobile phase* from the *Standard stock solution*

Sample stock solution: 0.3 mg/mL of mirtazapine in *Diluent* (from NLT 20 Tablets, finely powdered). Sonicate for 15 min with occasional swirling, and shake for 30 min. [NOTE—Alternatively, dissolve 10 Tablets in a volume of a mixture of acetonitrile and water (90:10) to obtain a 0.3 mg/mL solution of mirtazapine. Shake or stir until the mixture is free from lumps.]

Sample solution: Nominally, 0.036 mg/mL of mirtazapine in *Mobile phase* obtained as follows: transfer 40 mL of the *Sample stock solution* into a centrifuge tube, and centrifuge at 3000 rpm for 10 min. Transfer 6.0 mL of the supernatant into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass the portion through a polypropylene membrane filter of 0.45-μm pore size. Discard at least the first 5 mL of filtrate.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Misoprostol

$C_{22}H_{38}O_5$ 382.53
 Prost-13-en-1-oic acid, 11,16-dihydroxy-16-methyl-9-oxo-, methyl ester, (1*R**,2*R**,3*R**,*E*)-;
 (±)-Methyl (1*R*,2*R*,3*R*)-3-hydroxy-2-[(*E*)-(4*R**S*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate [59122-46-2].

DEFINITION

Misoprostol contains NLT 97.0% and NMT 102.0% of $C_{22}H_{38}O_5$, calculated on the anhydrous basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (1975)**
 Sample solution: 30 mg/mL
 Medium: Chloroform
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY**PROCEDURE**

Mobile phase: 2,2,4-Trimethylpentane, dioxane, and acetonitrile (78:21.5:0.5)

Standard solution: 5.0 mg/mL of USP Misoprostol RS in *Mobile phase*

Sample solution: 5.0 mg/mL of Misoprostol in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-μm packing L3

Flow rate: 2 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

[NOTE—Identify the impurities based on the retention times shown in *Impurity Table 1*.]

Suitability requirements

Resolution: NLT 1.2, between the second diastereomer peak for 12-epimisoprostol and the Misoprostol peak

Relative standard deviation: NMT 1.0%, for three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{22}H_{38}O_5$ in the portion of Misoprostol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the *Sample solution*

r_S = peak response of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES**Organic Impurities****PROCEDURE 1**

Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability:

Proceed as directed in the Assay.

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatogram for at least 3 times the retention time of the Misoprostol peak, and measure the peak responses. Identify the impurities based on the retention times shown in *Impurity Table 1*.

Calculate the percentage of each impurity in the portion of Misoprostol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of the *Standard solution*

C_S = concentration of USP Misoprostol RS in the *Standard solution* (mg/mL)

C_U = concentration of Misoprostol in the *Sample solution* (mg/mL)

F = relative response factor (see *Impurity Table 1*)

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 1.5%

^a Methyl 7-[(1*R**,2*S**)-2-[(*E*)-4-hydroxy-4-methyloct-1-enyl]-5-oxocyclopent-3-enyl]heptanoate.

^b (*E*)-Methyl 7-[2-(4-hydroxy-4-methyloct-1-enyl)-5-oxocyclopent-1-enyl]heptanoate.

^c Methyl 7-(3-hydroxy-5-oxocyclopent-1-enyl)heptanoate.

^d Methyl (1*S**,2*R**,3*R**)-3-hydroxy-2-[(*E*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate.

^e Methyl (1*S**,2*R**,3*S**)-3-hydroxy-2-[(*E*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate.

^f 12-Epimisoprostol consists of two diastereomers that are separated under these conditions; integrate both peaks together for the impurity calculations.

• PROCEDURE 2: CONTENT OF DIASTEREOMERS

Mobile phase: Hexane, ethanol, and isopropyl alcohol (94:4:2)

Sample solution: 1.0 mg/mL of Misoprostol in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 25-cm; 5-μm packing L3

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Sample: *Sample solution*

[NOTE—Identify the components based on their relative retention times which are about 0.92 for the first diastereomer peak and 1.0 for the second diastereomer peak.]

Suitability requirements

Resolution: NLT 2.0, between the two diastereomer peaks

Relative standard deviation: NMT 2.0% from the area of the first diastereomer peak

Analysis

Sample: *Sample solution*

Calculate the fraction of the first diastereomer in the portion of Misoprostol taken:

$$\text{Result} = r_1/(r_1 + r_2)$$

r_1 = peak response for the first diastereomer

r_2 = peak response for the second diastereomer

Acceptance criteria

Fraction of the first diastereomer: 0.51–0.56

SPECIFIC TESTS

- **WATER DETERMINATION, Method 1c (921):** NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a freezer.

• USP REFERENCE STANDARDS (11)

USP Misoprostol RS

Misoprostol Dispersion

DEFINITION

Misoprostol Dispersion is a mixture of Misoprostol and Hypromellose. It contains NLT 95.0% and NMT 104.0% of the labeled amount of misoprostol ($C_{22}H_{38}O_5$).

IDENTIFICATION

• A. ULTRAVIOLET ABSORPTION

Perform both *Procedure 1* and *Procedure 2*.

Procedure 1

Medium: Methanol and water (4:1)

Sample solution: Nominally 16 μg/mL of misoprostol in *Medium* prepared as follows. Dissolve the amount of Misoprostol Dispersion, equivalent to 400 μg of misoprostol, in 25 mL of *Medium*.

Blank: Prepare a solution of hypromellose in *Medium* having the same concentration as in the *Sample solution*.

Analysis: Determine UV absorption spectrum of *Sample solution* against the *Blank* from 330–230 nm.

Acceptance criteria 1: It exhibits no maximum near 280 nm.

Procedure 2

Medium: Methanol and 1 N potassium hydroxide (4:1)

Sample solution: Add 10 mL of *Medium* to 10 mL of the *Sample solution* prepared from *Procedure 1*. Allow to stand for 30 min at room temperature.

Blank: Add 10 mL of *Medium* to 10 mL of the *Blank* prepared from *Procedure 1*. Allow to stand for 30 min at room temperature.

Analysis: Determine UV absorption spectrum of *Sample solution* against the *Blank* from 330–230 nm.

Acceptance criteria 2: It exhibits a maximum near 280 nm.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

[NOTE—During addition of water to a solution of misoprostol in isopropyl alcohol, an exothermic reaction takes place. After each addition of water, invert the flask to mix isopropyl alcohol and water. Allow the solution to cool to room temperature before the final dilution.]

Buffer: 1.36 g/L of monobasic potassium phosphate in water, adjusted with phosphoric acid to a pH of 3.0 ± 0.1

Mobile phase: Isopropyl alcohol and *Buffer* (27:73)

Standard stock solution: 0.5 mg/mL of USP Misoprostol RS in isopropyl alcohol. [NOTE—This solution is stable up to 28 days when stored at 5 ± 3°.]

Standard solution: 0.1 mg/mL of USP Misoprostol RS in water from *Standard stock solution*. [NOTE—This solution is stable up to 7 days when stored at 5 ± 3°.]

Sample solution: Nominally 0.1 mg/mL of misoprostol prepared as follows. Place an amount of Misoprostol Dispersion, equivalent to about 10 mg of misoprostol, into a 100-mL volumetric flask, and add 25 mL of isopropyl alcohol. Shake to disperse the solid, place the solution in an ice bath, swirl, and allow to cool for 10 min. Carefully add about 70 mL of water, previously chilled in a refrigerator, remove from the ice bath, and shake. Sonicate as necessary at a temperature not exceeding 20°. Equilibrate to room temperature, dilute with water to volume, and immediately cool the solu-

tion to 5°. [NOTE—This solution is stable up to 7 days when stored at 5 ± 3°.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Temperatures

Column: 50 ± 2°; the *Mobile phase* must be preheated prior to introduction on the column.

Autosampler: 5 ± 3°

Flow rate: 1.5 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

[NOTE—USP Misoprostol RS contains 12-epimisoprostol as a minor component. The relative retention times for 12-epimisoprostol and misoprostol are 0.84 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.7 between 12-epimisoprostol and misoprostol

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of misoprostol (C₂₂H₃₈O₅) in the portion of Misoprostol Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Misoprostol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of misoprostol in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–104.0%

IMPURITIES

• ORGANIC IMPURITIES

[NOTE—During the addition of water to a solution of misoprostol in isopropyl alcohol, an exothermic reaction takes place. After each addition of water, invert the flask to mix isopropyl alcohol and water. Allow the solution to cool to room temperature before the final dilution.]

Buffer, *Mobile phase*, *Standard solution*, *Sample solution*, and *Chromatographic system*: Proceed as directed in the *Assay*.

Diluent: Isopropyl alcohol and water (27:73)

Blank: Prepare a solution of hypromellose in the *Diluent* having the same concentration as in the *Sample solution*.

Diluted standard solution: 0.5 μg/mL of USP Misoprostol RS in *Diluent* from *Standard solution*

Sensitivity solution: 0.1 μg/mL of USP Misoprostol RS in *Diluent* from *Diluted standard solution*

System suitability

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.7 between 12-epimisoprostol and misoprostol, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Sample solution*, *Blank*, and *Diluted standard solution*

Calculate the percentage of any individual impurity in the portion of Misoprostol Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of any individual impurity from the *Sample solution*

r_S = peak response of misoprostol from the *Diluted standard solution*

C_S = concentration of USP Misoprostol RS in the *Diluted standard solution* (μg/mL)

C_U = nominal concentration of misoprostol in the *Sample solution* (μg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. Disregard a peak from the *Diluent*, eluting at about 4 min, and any other peak observed in the *Blank*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
12-Epimisoprostol	0.84	—	— ^a
8-Epimisoprostol ^b	0.90	0.90	0.50
Misoprostol	1.0	—	—
B-Type misoprostol ^c	1.6	0.78	0.30
A-Type misoprostol ^d	1.9	2.6	0.50
Any other individual impurity	—	1.0	0.1
Total impurities	—	—	1.8

^a This is a process impurity in the manufacturing of misoprostol. It is controlled in the misoprostol, which is the starting material for the Misoprostol Dispersion. This impurity is included in the table for identification only, and it is not to be reported or included in the total impurities for the Misoprostol Dispersion.

^b Methyl (1*S**,2*R**,3*R**)-3-hydroxy-2-[(*E*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate.

^c (*E*)-Methyl 7-[2-(4-hydroxy-4-methyloct-1-enyl)-5-oxocyclopent-1-enyl]heptanoate.

^d Methyl 7-[(1*R**,2*S**)-2-[(*E*)-4-hydroxy-4-methyloct-1-enyl]-5-oxocyclopent-3-enyl]heptanoate.

SPECIFIC TESTS

• WATER DETERMINATION, *Method 1c* (921)

Sample: 300 mg

Analysis: Perform the test immediately after opening the sample container. Use the evaporation technique in which water is released and evaporated from the *Sample* by heating it in an external oven at 105° and transferring it to the reaction cell with the aid of an inert gas.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, and store in a refrigerator.
- **LABELING:** The label states that this article is not intended for direct administration to humans or animals. Label it to indicate the nominal concentration or percentage of misoprostol in the Misoprostol Dispersion.
- **USP REFERENCE STANDARDS (11)**
USP Misoprostol RS

Mitomycin

C₁₅H₁₈N₄O₅ 334.33
Azirino[2',3':3,4]pyrrolo[1,2-*a*]indole-4,7-dione, 6-amino-8-[[[aminocarbonyloxy]methyl]-1,1a,2,8,8a,8b-hexahydro-8a-methoxy-5-methyl-, [1*aS*-(1*α*,8*β*,8*α*,8*β*)]-];

(1aS,8S,8aR,8bS)-(6-Amino-8a-methoxy-5-methyl-4,7-dioxo-1,1a,2,4,7,8,8a,8b-octahydroazirino[2',3':3,4]pyrrolo[1,2-a]indol-8-yl)methyl carbamate;
Mitomycin C [50-07-7].

DEFINITION

Mitomycin has a potency of NLT 970 µg/mg of mitomycin (C₁₅H₁₈N₄O₅).

IDENTIFICATION

• A. INFRARED ABSORPTION (197M)

Analysis: Do not dry the sample and standard.

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Dissolve 1.54 g of ammonium acetate in 250 mL of methanol. Add 5.0 mL of 0.83 N acetic acid and water to make 1000 mL.

System suitability solution: 0.5 mg/mL of USP Mitomycin RS and 7.5 mg/mL of 3-ethoxy-4-hydroxybenzaldehyde in *N,N*-dimethylacetamide

Standard solution: 0.5 mg/mL of USP Mitomycin RS in *N,N*-dimethylacetamide

Sample solution: 0.5 mg/mL of Mitomycin in *N,N*-dimethylacetamide

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 365 nm

Column: 3.9-mm × 30-cm; 10-µm packing L11

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for mitomycin and 3-ethoxy-4-hydroxybenzaldehyde are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 1.8 between mitomycin and 3-ethoxy-4-hydroxybenzaldehyde, *System suitability solution*

Tailing factor: NMT 1.3, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in µg/mg, of mitomycin (C₁₅H₁₈N₄O₅) in the portion of Mitomycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Mitomycin RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of mitomycin in USP Mitomycin RS (µg/mg)

Acceptance criteria: NLT 970 µg/mg

IMPURITIES

• ORGANIC IMPURITIES

Solution A: 0.77 g/L of ammonium acetate

Solution B: Methanol and *Solution A* (20:80)

Solution C: Methanol and *Solution A* (50:50)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution B (%)	Solution C (%)
0	100	0
10	100	0
30	0	100
45	0	100
50	100	0

Standard solution: 0.025 mg/mL of USP Mitomycin RS in methanol

Sensitivity solution: 2.5 µg/mL of USP Mitomycin RS in methanol

Sample solution: 5 mg/mL of Mitomycin in methanol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *Sensitivity solution* and *Standard solution*

Suitability requirements

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Mitomycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (F_1/F_2) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of mitomycin from the *Standard solution*

C_S = concentration of USP Mitomycin RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of mitomycin in USP Mitomycin RS (µg/mg)

F_1 = conversion factor, 0.001 mg/µg

F_2 = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. The reporting threshold is 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Albomitomycin C ^a	0.6	1.0	0.5
Mitomycin	1.0	—	—
Mitomycin B ^b	1.2	1.0	0.5
Cinnamamide	1.3	2.9	0.5
Mitomycin A ^c	1.6	1.0	0.5

^a [(1S,2S,4aS,8aR,9S,9aR)-7-Amino-9a-methoxy-6-methyl-5,8-dioxo-1,2,3,5,8,8a,9,9a-octahydro-1,2,4a-metheno-(epinitrilo)pyrrolo[1,2-a]indol-9-yl)methyl carbamate.

^b [(1aS,8S,8aR,8bS)-8a-Hydroxy-6-methoxy-1,5-dimethyl-4,7-dioxo-1,1a,2,4,7,8,8a,8b-octahydroazirino[2',3':3,4]pyrrolo[1,2-a]indol-8-yl)methyl carbamate.

^c [(1aS,8S,8aR,8bS)-6,8a-Dimethoxy-5-methyl-4,7-dioxo-1,1a,2,4,7,8,8a,8b-octahydroazirino[2',3':3,4]pyrrolo[1,2-a]indol-8-yl)methyl carbamate.

Table 2 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Any individual unspecified impurity	—	1.0	0.5
Total impurities	—	—	2.0

^a {(1S,2S,4aS,8aR,9S,9aR)-7-Amino-9a-methoxy-6-methyl-5,8-dioxo-1,2,3,5,8,8a,9,9a-octahydro-1,2,4a-metheno-(epinitrilo)pyrrolo[1,2-a]indol-9-yl)methyl carbamate.

^b {(1aS,8S,8aR,8bS)-8a-Hydroxy-6-methoxy-1,5-dimethyl-4,7-dioxo-1,1a,2,4,7,8,8a,8b-octahydroazirino[2',3':3,4]pyrrolo[1,2-a]indol-8-yl)methyl carbamate.

^c {(1aS,8S,8aR,8bS)-6,8a-Dimethoxy-5-methyl-4,7-dioxo-1,1a,2,4,7,8,8a,8b-octahydroazirino[2',3':3,4]pyrrolo[1,2-a]indol-8-yl)methyl carbamate.

SPECIFIC TESTS

- **CRYSTALLINITY (695):** Meets the requirements

- **PH (791)**

Sample: 5-mg/mL suspension in water

Acceptance criteria: 6.0–7.5

- **WATER DETERMINATION, Method I (921):** NMT 2.5%
- **STERILITY TESTS (71):** Where the label states that Mitomycin is sterile, it meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **BACTERIAL ENDOTOXINS TEST (85):** Where the label states that Mitomycin is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 10.0 USP Endotoxin Units/mg of mitomycin.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS
USP Mitomycin RS

Mitomycin for Injection**DEFINITION**

Mitomycin for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of mitomycin ($C_{15}H_{18}N_4O_5$).

IDENTIFICATION

- **A.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the Assay.

ASSAY• **PROCEDURE**

Mobile phase: Dissolve 1.54 g of ammonium acetate in 250 mL of methanol. Add 5.0 mL of 0.83 N acetic acid and water to make 1000 mL.

System suitability solution: 0.5 mg/mL of USP Mitomycin RS and 7.5 mg/mL of 3-ethoxy-4-hydroxybenzaldehyde in *N,N*-dimethylacetamide

Standard solution: 0.5 mg/mL of USP Mitomycin RS in *N,N*-dimethylacetamide

Sample solution: Add an accurately measured volume of *N,N*-dimethylacetamide to 1 container of Mitomycin for Injection to obtain a solution that is nominally 0.5 mg/mL of mitomycin.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 365 nm

Column: 3.9-mm × 30-cm; 10-μm packing L11

Flow rate: 2 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for mitomycin and 3-ethoxy-4-hydroxybenzaldehyde are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 1.8 between mitomycin and 3-ethoxy-4-hydroxybenzaldehyde, *System suitability solution*

Tailing factor: NMT 1.3, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mitomycin ($C_{15}H_{18}N_4O_5$) in the container of Mitomycin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Mitomycin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mitomycin in the *Sample solution* (mg/mL)

P = potency of mitomycin in USP Mitomycin RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

SPECIFIC TESTS

- **PH (791)**

Sample solution: Constitute as directed in the labeling.

Acceptance criteria: 6.0–8.0 where it contains mannitol, and 5.5–8.5 where it contains hydroxypropyl betadex

- **WATER DETERMINATION, Method Ia (921)**

Sample solution: Prepare as directed for a hygroscopic specimen, using the pooled contents of five containers.

Acceptance criteria: NMT 5.0%

- **BACTERIAL ENDOTOXINS TEST (85):** Contains NMT 10.0 USP Endotoxin Units/mg of mitomycin
- **STERILITY TESTS (71):** Meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*
- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products* (1)

ADDITIONAL REQUIREMENTS**Change to read:**

- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017), protected from light. Store at 25°, excursions permitted between 15° and 30°.

Mitomane

$C_{14}H_{10}Cl_4$ 320.04
Benzene, 1-chloro-2-[2,2-dichloro-1-(4-chlorophenyl)ethyl]-, (RS)-;
(±)-1,1-Dichloro-2-(o-chlorophenyl)-2-(p-chlorophenyl)ethane [53-19-0].

DEFINITION

Mitomane contains NLT 97.0% and NMT 103.0% of mitotane ($C_{14}H_{10}Cl_4$), calculated on the anhydrous basis.
[CAUTION—Handle Mitotane with exceptional care, because it is a highly potent agent.]

IDENTIFICATION

- **A. INFRARED ABSORPTION (17M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 1.38 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Buffer* (75:25)

System suitability solution: 0.2 mg/mL of USP

Mitomane RS and 0.2 mg/mL of the *p,p'*-isomer of mitotane in *Mobile phase*. [NOTE—The *p,p'*-isomer of mitotane is 1,1-dichloro-2,2-bis(*p*-chlorophenyl)ethane known as *p,p'*-DDD.]

Standard solution: 0.2 mg/mL of USP Mitotane RS in *Mobile phase*

Sample solution: 0.2 mg/mL of Mitotane in *Mobile phase*. [NOTE—Inject within 48 h of preparation.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for the *p,p'*-isomer of mitotane and mitotane are about 0.92 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the *p,p'*-isomer of mitotane and mitotane, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mitotane ($C_{14}H_{10}Cl_4$) in the portion of Mitotane taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Mitotane RS in the *Standard solution* (mg/mL)

C_U = concentration of Mitotane in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.5%

SPECIFIC TESTS

- **WATER DETERMINATION, Method Ia (921):** NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
USP Mitotane RS

Mitomane Tablets

» Mitotane Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mitotane ($C_{14}H_{10}Cl_4$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Mitotane RS

Identification—Triturate a quantity of finely powdered Tablets, equivalent to about 500 mg of mitotane, with 10 mL of water, filter on a sintered-glass filter funnel, and wash the residue with two 5-mL portions of water. Transfer the residue to a small beaker, add 4 mL of alcohol, heat to boiling, and filter immediately. Allow the filtrate to cool, filter the crystals of mitotane, wash once with 2 mL of alcohol, and dry in vacuum at 60° for 2 hours: the IR absorption spectrum of a mineral oil dispersion of the mitotane so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Mitotane RS.

Disintegration (701): 15 minutes, the use of disks being omitted.

Uniformity of dosage units (905): meet the requirements.

Assay—

Standard preparation—Dissolve about 50 mg of USP Mitotane RS, accurately weighed, in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution having a known concentration of about 200 μg per mL.

Assay preparation—Weigh and finely powder not less than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of mitotane, to a 250-mL volumetric flask, add 100 mL of methanol, and shake occasionally for 5 minutes, then dilute with methanol to volume, and mix. Filter, rejecting the first portion of the filtrate, transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 268 nm, with a suitable spectrophotometer, using methanol as the blank.

Calculate the quantity, in mg, of $C_{14}H_{10}Cl_4$ in the portion of Tablets taken by the formula:

$$0.5C(A_U/A_S)$$

in which C is the concentration, in mg/mL, of USP Mitotane RS in the *Standard preparation*, and A_U and A_S are the ab-

sorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Mitoxantrone Injection

» Mitoxantrone Injection is a sterile solution of Mitoxantrone Hydrochloride in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 105.0 percent of the labeled amount of mitoxantrone ($C_{22}H_{28}N_4O_6$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

Labeling—Label Injection to state both the content of the active moiety and the name of the salt used in formulating the article. Label Mitoxantrone Injection to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration.

USP Reference standards (11)—

USP Mitoxantrone Hydrochloride RS

USP Mitoxantrone System Suitability Mixture RS

A mixture of 9,10-anthracenedione, 8-amino-1,4-dihydroxy-5-[[2-[(2-hydroxyethyl)amino]ethyl]amino]-, hydrochloride ($C_{18}H_{19}N_3O_5 \cdot HCl$ 393.83) and USP Mitoxantrone Hydrochloride RS.

Identification—Transfer a volume of Injection, equivalent to about 2 mg of mitoxantrone, to a 200-mL volumetric flask, add 100 mL of water and 20 mL of 1 N hydrochloric acid, dilute with water to volume, and mix: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Mitoxantrone Hydrochloride RS.

Bacterial Endotoxins Test (85)—It contains not more than 5 Endotoxin Units per mg of mitoxantrone.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, the entire contents of each container being used.

pH (791): between 3.0 and 4.5.

Chromatographic purity—Using the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of each impurity in the Injection taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the response of any individual peak, other than the main mitoxantrone peak; and r_s is the sum of the responses of all the peaks in the chromatogram, including that of the main mitoxantrone peak: not more than 1.5% of any individual impurity and not more than 3.0% of the total impurities is found.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Sodium 1-heptanesulfonate solution, Mobile phase, System suitability solution, and Chromatographic system—Proceed as directed in the *Assay* under *Mitoxantrone Hydrochloride*.

Standard preparation—Transfer about 23 mg of USP Mitoxantrone Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 40 mL of *Mobile phase*, and dissolve by sonicating for about 5 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 0.4 mg of mitoxantrone ($C_{22}H_{28}N_4O_6$) per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 4 mg of mitoxantrone ($C_{22}H_{28}N_4O_6$), to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Mitoxantrone Hydrochloride*. Calculate the quantity, in mg, of mitoxantrone ($C_{22}H_{28}N_4O_6$) in each mL of the Injection taken by the formula:

$$(444.49 / 517.40)(10C / V)(r_u / r_s)$$

in which 444.49 and 517.40 are the molecular weights of mitoxantrone and mitoxantrone hydrochloride, respectively; V is the volume, in mL, of the portion of Injection taken; and the other terms are as defined therein.

Mitoxantrone Hydrochloride

$C_{22}H_{28}N_4O_6 \cdot 2HCl$ 517.40

9,10-Anthracenedione, 1,4-dihydroxy-5,8-bis[[2-[(2-hydroxyethyl)amino]ethyl]amino]-, dihydrochloride. 1,4-Dihydroxy-5,8-bis[[2-[(2-hydroxyethyl)amino]ethyl]amino]anthraquinone dihydrochloride. [70476-82-3].

» Mitoxantrone Hydrochloride contains not less than 97.0 percent and not more than 102.0 percent of $C_{22}H_{28}N_4O_6 \cdot 2HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Mitoxantrone Hydrochloride RS

USP Mitoxantrone System Suitability Mixture RS

A mixture of 9,10-anthracenedione, 8-amino-1,4-dihydroxy-5-[[2-[(2-hydroxyethyl)amino]ethyl]amino]-, hydrochloride ($C_{18}H_{19}N_3O_5 \cdot HCl$ 393.83) and USP Mitoxantrone Hydrochloride RS.

Identification, Infrared Absorption (197K).

Water Determination, Method I (921): not more than 6.0%.

Alcohol—

Standard solution—Transfer 5.0 mL of dehydrated alcohol to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Internal standard solution—Transfer 5.0 mL of *n*-propyl alcohol to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Standard preparation—Transfer 10.0 mL of the *Standard solution* to a 25-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, dilute with water to volume, and mix. This solution contains 0.063 mg of alcohol (C_2H_5OH) per mL.

Test preparation—Transfer about 100 mg of Mitoxantrone Hydrochloride, accurately weighed, to a 5-mL volumetric flask, add 2.0 mL of the *Internal standard solution*, dilute with water to volume, and mix. Sonicate for 2 minutes and shake for 2 minutes, repeating these actions until the specimen is completely dissolved.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 3-m column that contains 20% phase G1 and 0.1% phase G39 on silanized support S1A. Maintain the column at 50° for 5 minutes, then increase the temperature at a rate of 30° per minute. When 140° is reached, maintain that temperature for 20 minutes. Maintain the injection port at 200° and the detection block at 250°. Use helium as the carrier gas at a flow rate of about 15 mL per minute. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for alcohol and 1.0 for *n*-propyl alcohol, the resolution, *R*, between the alcohol and the *n*-propyl alcohol peaks is not less than 6.0, and the tailing factors for the two peaks are not more than 2.0.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of alcohol (C₂H₅OH) in the portion of Mitoxantrone Hydrochloride taken by the formula:

$$500(C/W)(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of alcohol (C₂H₅OH) in the *Standard preparation*; *W* is the weight, in mg, of Mitoxantrone Hydrochloride taken; and *R_U* and *R_S* are the ratios of the response of the alcohol peak to that of the *n*-propyl alcohol peak obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 1.5% is found.

Delete the following:

• **Heavy metals** (231)—Proceed as directed under *Method II*, except in the *Procedure* to filter the final solutions through a suitable acid-resistant membrane filter of 0.22 µm or finer porosity, instead of viewing them over a dark surface: the precipitate on the filter obtained from the *Test Preparation* is not darker than that obtained from the *Standard Preparation*. The limit is 0.002%. • (Official 1-Jan-2018)

Chromatographic purity—Using the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of each impurity in the Mitoxantrone Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which *r_i* is the response of any individual peak, other than the main mitoxantrone peak, and *r_s* is the sum of the responses of all the peaks in the chromatogram, including that of the main mitoxantrone peak: not more than 1.0% of any individual impurity and not more than 2.0% of total impurities is found.

Assay—

Sodium 1-heptanesulfonate solution—Dissolve 22.0 g of sodium 1-heptanesulfonate in about 150 mL of water, pass through a suitable filter having a 0.5-µm or finer porosity, and transfer the filtrate to a 250-mL volumetric flask. Wash the filter with about 50 mL of water, adding the filtrate to the 250-mL volumetric flask. Add 32.0 mL of glacial acetic acid to the volumetric flask, dilute with water to volume, and mix.

Mobile phase—Prepare a suitable degassed mixture of water, acetonitrile, and *Sodium 1-heptanesulfonate solution* (750:250:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Prepare a solution of USP Mitoxantrone System Suitability Mixture RS in a suitable volume of *Mobile phase* to obtain a solution containing about

0.2 mg of 8-amino-1,4-dihydroxy-5[[2-[(2-hydroxyethyl)amino]ethyl]amino]-9,10-anthracenedione hydrochloride (mitoxantrone related compound A) and 0.1 mg of mitoxantrone hydrochloride per mL.

Standard preparation—Transfer about 20 mg of USP Mitoxantrone Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 40 mL of *Mobile phase*, and dissolve by sonicating for about 5 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 20 mg of Mitoxantrone Hydrochloride, accurately weighed, to a 50-mL volumetric flask, add 40 mL of *Mobile phase*, and dissolve by sonicating for about 5 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The flow rate is about 3 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for mitoxantrone and 1.0 for mitoxantrone related compound A; the resolution, *R*, between mitoxantrone and mitoxantrone related compound A is not less than 3.0; and the tailing factor for the mitoxantrone peak is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, *k'*, for mitoxantrone is not less than 3.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. [NOTE—After use, wash the column with a mixture of acetonitrile and water (50:50), and store in this mixture.] Calculate the quantity, in mg, of C₂₂H₂₈N₄O₆ · 2HCl in the portion of Mitoxantrone Hydrochloride taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of anhydrous mitoxantrone hydrochloride in the *Standard preparation*, as determined from the content of USP Mitoxantrone Hydrochloride RS corrected for the water content determined by a titrimetric water determination; and *r_U* and *r_S* are the mitoxantrone peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Modafinil

C₁₅H₁₅NO₂S

273.35

Acetamide, 2-[(diphenylmethyl)sulfinyl]-;
2-[(Diphenylmethyl)sulfinyl]-acetamide [68693-11-8].

DEFINITION

Modafinil contains NLT 98.0% and NMT 101.5% of C₁₅H₁₅NO₂S, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

ASSAY

- **PROCEDURE**

Buffer: 6.8 g/L of potassium dihydrogen phosphate in water. Adjust with phosphoric acid to a pH of 2.3.

Mobile phase: Acetonitrile and Buffer (35:65)
Diluent: Acetonitrile and water (35:65)
System suitability solution: 5 µg/mL of USP Modafinil RS and 10 µg/mL of USP Salicylic Acid RS in *Diluent*
Standard solution: 0.1 mg/mL of USP Modafinil RS in *Diluent*

Sample solution: 0.1 mg/mL of Modafinil in *Diluent*
Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for modafinil and salicylic acid are about 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 1.3 between modafinil and salicylic acid

Tailing factor: NMT 1.5 for the modafinil peak

Relative standard deviation: NMT 2.0% for the modafinil peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of modafinil ($C_{15}H_{15}NO_2S$) in the portion of Modafinil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Modafinil RS in the *Standard solution* (mg/mL)

C_U = concentration of Modafinil in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.5% on the anhydrous basis

^d 2-[(Diphenylmethyl)sulfinyl]acetic acid methyl ester.

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 0.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

- **USP REFERENCE STANDARDS** (11)

USP Modafinil RS

USP Salicylic Acid RS

Modafinil Tablets

DEFINITION

Modafinil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of modafinil ($C_{15}H_{15}NO_2S$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Standard specimen: Transfer a quantity, in mg, of USP Modafinil RS, equivalent to the labeled amount of modafinil, to a suitable container. Add 50 mL each of dichloromethane and water. Shake the mixture, and allow the layers to separate. Filter a portion of the lower (dichloromethane) layer, and evaporate to dryness, using a stream of nitrogen if necessary. Prepare a potassium bromide pellet of the residue.

Sample specimen: Grind 1 Tablet, and add 50 mL each of dichloromethane and water. Shake the mixture, and allow the layers to separate. Filter a portion of the lower (dichloromethane) layer, and evaporate to dryness, using a stream of nitrogen if necessary. Prepare a potassium bromide pellet of the residue.

Acceptance criteria: Meet the requirements

ASSAY

- **PROCEDURE**

Buffer: 6.8 g/L of potassium dihydrogen phosphate in water. Adjust with phosphoric acid to a pH of 2.3.

Mobile phase: Acetonitrile and Buffer (35:65)

Diluent A: Acetonitrile and water (35:65)

Diluent B: Acetonitrile, water, and acetic acid (35:65:1)

System suitability solution: 5 µg/mL of USP Modafinil RS and 10 µg/mL of USP Salicylic Acid RS in *Diluent A*

Standard solution: 0.4 mg/mL of USP Modafinil RS in *Diluent B*

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 100 mg of modafinil, to a 250-mL volumetric flask, add 200 mL of *Diluent B*, and sonicate for about 5 min with intermittent manual shaking. Dilute with *Diluent B* to

volume, and mix. Pass through a suitable filter of 0.45- μ m or finer pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 5 μ L

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for modafinil and salicylic acid are 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 1.3 between modafinil and salicylic acid

Tailing factor: NMT 1.5 for the modafinil peak

Relative standard deviation: NMT 2.0% for the modafinil peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of modafinil ($C_{15}H_{15}NO_2S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Modafinil RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of modafinil in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: Prepare a solution having a known concentration of USP Modafinil RS in *Medium*.

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium* if necessary

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Absorption maximum at about 222 nm

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the amount of modafinil ($C_{15}H_{15}NO_2S$) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of modafinil ($C_{15}H_{15}NO_2S$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 2.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: ($L/900$) mg/mL of USP Modafinil RS, where L is the label claim (mg/Tablet). Prepare by dissolving the standard in a volume of methanol equivalent to 5%–10% of the final volume and then diluting with *Medium* to volume.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Absorption maximum at about 225 nm

Cell: 0.1 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of modafinil ($C_{15}H_{15}NO_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of modafinil ($C_{15}H_{15}NO_2S$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 3.

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated

Apparatus 2: 75 rpm

Time: 30 min

Standard solution: ($L/900$) mg/mL of USP Modafinil RS, where L is the label claim (mg/Tablet). Prepare by dissolving the standard in a volume of methanol equivalent to 5%–10% of the final volume and then diluting with *Medium* to volume.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Absorption maximum at about 220 nm

Cell: 0.1 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of modafinil ($C_{15}H_{15}NO_2S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of modafinil ($C_{15}H_{15}NO_2S$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

^d (S)-6,7-Dimethoxy-2-[(S)-2-[(S)-1-methoxy-1-oxo-4-phenylbutan-2-ylamino]propanoyl]-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid.

^e (S)-2-[(S)-2-[(S)-4-Cyclohexyl-1-ethoxy-1-oxobutan-2-ylamino]propanoyl]-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid.

^f (S)-Ethyl 2-[(3S,11aS)-8,9-dimethoxy-3-methyl-1,4-dioxo-3,4-dihydro-1H-pyrazino[1,2-b]isoquinolin-2(6H,11H,11aH)-yl]-4-phenylbutanoate.

^g (S)-tert-Butyl 2-[(S)-2-[(S)-1-ethoxy-1-oxo-4-phenylbutan-2-ylamino]propanoyl]-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline-3-carboxylate.

^h Sum of all specified and unspecified impurities.

• CONTENT OF IMIDAZOLE

Mobile phase: Hexane, isopropyl alcohol, and diethylamine (52:48:0.025)

Standard solution: 0.01 mg/mL of USP Imidazole RS in *Mobile phase*. [NOTE—Sonication may be necessary for complete dissolution.]

Sample solution: 2 mg/mL of Moexipril Hydrochloride in *Mobile phase*. [NOTE—Sonication may be necessary for complete dissolution. Use freshly prepared *Sample solution* for analysis.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5-μm packing L3

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: NLT 3.3 times the retention time of imidazole

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of imidazole in the portion of Moexipril Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of imidazole from the *Sample solution*

r_s = peak response of imidazole from the *Standard solution*

C_s = concentration of USP Imidazole RS in the *Standard solution* (mg/mL)

C_u = concentration of Moexipril Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.03%

SPECIFIC TESTS

• **WATER DETERMINATION** (921), *Method I*, *Method Ia*: NMT 1.5%

• **OPTICAL ROTATION** (781S), *Procedures*, *Specific Rotation*
Sample solution: 0.011 g/mL of Moexipril Hydrochloride in alcohol. Sonicate to dissolve the sample.

Acceptance criteria: +30.0° to +38.0°

Moexipril Hydrochloride Tablets

DEFINITION

Moexipril Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION (197U)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: 0.01 M potassium dihydrogen phosphate
Diluent: Acetonitrile and water (30:70)
Mobile phase: Acetonitrile and *Buffer* (350:650)
Standard solution: 0.075 mg/mL of USP Moexipril Hydrochloride RS in *Diluent*. Initially fill with *Diluent* to about 70% of the total volume, and sonicate. Further dilute with *Diluent* to volume.
Sample solution: Nominally 0.075 mg/mL of moexipril hydrochloride in *Diluent*, prepared from a sufficient number of crushed Tablets as follows. Add *Diluent* to about 75% of the total volume, and sonicate for 30 min with intermittent shaking. Dilute with *Diluent* to volume, and pass through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

Run time: 4 times the retention time of the moexipril peak

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Moexipril Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of moexipril hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

Buffer, Diluent, Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 15 min

Standard stock solution: 0.16 mg/mL of USP Moexipril Hydrochloride RS in *Diluent*. [NOTE—Sonication may be necessary for complete dissolution.]

Standard solution: 0.016 mg/mL of USP Moexipril Hydrochloride RS in *Medium* from the *Standard stock solution* for 15-mg Tablet strength and 0.008 mg/mL of USP Moexipril Hydrochloride RS in *Medium* from the *Standard stock solution* for 7.5-mg Tablet strength

Sample solution: Pass 10 mL of the solution under test through a suitable filter of 0.45- μ m pore size, discarding the first 2–3 mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of moexipril from the *Sample solution*

r_S = peak response of moexipril from the *Standard solution*

C_S = concentration of USP Moexipril Hydrochloride RS in the *Standard solution*

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Buffer, Diluent, Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Medium, Apparatus 2, Standard stock solution, Standard solution, Sample solution, and Analysis: Proceed as directed in Test 1.

Time: 30 min

Tolerances: NLT 80% (Q) of the labeled amount of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements for Content Uniformity

IMPURITIES

Change to read:

• ORGANIC IMPURITIES

Solution A: 0.025% trifluoroacetic acid in water

Solution B: Acetonitrile and tetrahydrofuran (90:10)

Diluent: Acetonitrile and water (30:70)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
50	30	70
60	95	5
70	95	5

Impurity stock solution: 0.12 mg/mL of USP Moexipril Related Compound G RS in *Diluent*. [NOTE—Sonication may be necessary for complete dissolution.]

System suitability solution: 1.2 mg/mL of USP Moexipril Hydrochloride RS and 2.4 µg/mL of USP Moexipril Related Compound G RS from the *Impurity stock solution* in *Diluent*. [NOTE—Sonication may be necessary for complete dissolution.]

Standard stock solution: 1.2 mg/mL of USP Moexipril Hydrochloride RS in *Diluent*. Initially add *Diluent* to about 60% of the volume of the flask, and sonicate with intermittent shaking for complete dissolution.

Standard solution: 6 µg/mL each of USP Moexipril Related Compound A RS and USP Moexipril Related Compound B RS, and 1.2 µg/mL of USP Moexipril Hydrochloride RS in *Diluent* from the *Standard stock solution*. [NOTE—Sonication may be necessary for complete dissolution.]

Sample solution: Nominally 1.2 mg/mL of moexipril hydrochloride in *Diluent*, prepared from a sufficient number of crushed Tablets. Initially add *Diluent* to about 60% of the volume of the flask, and sonicate for 20 min with intermittent shaking in ice cold water. Dilute with *Diluent* to volume. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.5 between moexipril and moexipril related compound G, *System suitability solution*

Tailing factor: NMT 2.0 for the moexipril peak, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *System suitability solution*, *Standard solution*, and *Sample solution*

Calculate the percentage of moexipril related compound A and moexipril related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of moexipril related compound A and moexipril related compound B from the *Sample solution*

r_S = peak response of moexipril related compound A and moexipril related compound B from the *Standard solution*

C_S = concentration of USP Moexipril Related Compound A RS and USP Moexipril Related Compound B RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of moexipril hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual unspecified degradation product from the *Sample solution*

r_S = peak response of moexipril from the *Standard solution*

C_S = concentration of USP Moexipril Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of moexipril hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2. Disregard peaks less than 0.1%. (RB 1-Jun-2016)

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Moexipril Hydrochloride and Hydrochlorothiazide Tablets

DEFINITION

Moexipril Hydrochloride and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% each of the labeled amounts of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 0.01 M potassium dihydrogen phosphate

Mobile phase: Acetonitrile and *Buffer* (350:650)

Diluent: Acetonitrile and water (30:70)

Standard solution: Prepare solutions of USP Moexipril Hydrochloride RS and USP Hydrochlorothiazide RS in *Diluent*, of concentrations stated in *Table 1*. Initially add *Diluent* to 70% of the total volume, sonicate to dissolve, and then dilute with *Diluent* to volume.

Table 1

Tablet Strength Moexipril Hydrochloride/ Hydrochlorothiazide (mg/mg)	Concentration of Moexipril Hydrochloride (mg/mL)	Concentration of Hydrochlorothiazide (mg/mL)
7.5/12.5	0.06	0.1
15/12.5	0.06	0.05
15/25	0.06	0.1

Sample solution: Prepare the *Sample solutions* of nominal concentrations given in *Table 1* from NLT 20 powdered Tablets as follows. Initially add *Diluent* to about 60% of the total volume, sonicate for 45 min with intermittent shaking, and then dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 2.2 times the retention time of the moexipril peak

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 2500 theoretical plates for moexipril and NLT 4000 theoretical plates for the hydrochlorothiazide peaks

Tailing factor: NMT 2.0 for both moexipril and hydrochlorothiazide peaks

Relative standard deviation: NMT 2.0% for both moexipril and hydrochlorothiazide peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of moexipril or hydrochlorothiazide from the *Sample solution*

r_S = peak response of moexipril or hydrochlorothiazide from the *Standard solution*

C_S = concentration of USP Moexipril Hydrochloride RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of moexipril hydrochloride or hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of the labeled amounts of moexipril hydrochloride and hydrochlorothiazide

PERFORMANCE TESTS

• DISSOLUTION (711)

Buffer, Mobile phase, Diluent, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 15 min

Standard solution: Prepare solutions of USP Moexipril Hydrochloride RS and USP Hydrochlorothiazide RS in *Medium* of concentrations stated in *Table 2*.

Table 2

Tablet Strength Moexipril Hydrochloride/ Hydrochlorothiazide (mg/mg)	Concentration of USP Moexipril Hydrochloride RS (μ g/mL)	Concentration of USP Hydrochlorothiazide RS (μ g/mL)
7.5/12.5	8	14
15/12.5	16	14
15/25	16	28

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, discarding the first 2–3 mL.

Analysis**Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amounts of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of moexipril or hydrochlorothiazide from the *Sample solution*

r_S = peak response of moexipril or hydrochlorothiazide from the *Standard solution*

C_S = concentration of USP Moexipril Hydrochloride RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

L = label claim for moexipril hydrochloride or hydrochlorothiazide (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 70% (Q) of the labeled amounts each of moexipril hydrochloride ($C_{27}H_{34}N_2O_7 \cdot HCl$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) are dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Solution A: Add 1 mL of trifluoroacetic acid to 4 L of water.

Solution B: Acetonitrile and tetrahydrofuran (90:10)

Mobile phase: See Table 3.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	95	5
50	30	70
60	95	5
70	95	5

Diluent: Proceed as directed in the *Assay*.

System suitability solution: 1.2 mg/mL of USP Moexipril Hydrochloride RS, 2 mg/mL of USP Hydrochlorothiazide RS, and 2.4 µg/mL of USP Moexipril Related Compound G RS in *Diluent*. Initially add *Diluent* to 70% of the total volume, sonicate to dissolve, and then dilute with *Diluent* to volume.

Standard solution: 1.2 µg/mL of USP Moexipril Hydrochloride RS, 12 µg/mL each of USP Moexipril Related Compound A RS and USP Moexipril Related Compound B RS, 2 µg/mL of USP Hydrochlorothiazide RS, and 40 µg/mL each of USP Benzothiadiazine Related Compound A RS and USP Chlorothiazide RS in *Diluent*. Initially add *Diluent* to 70% of the total volume, sonicate to dissolve, and then dilute with *Diluent* to volume.

Sample solution: Prepare solutions of nominal concentration given in Table 4. Initially add *Diluent* to 70% of the total volume, and sonicate for 15 min with intermittent shaking in ice cold water. Dilute with *Diluent* to volume, and pass through a suitable filter of 0.45-µm pore size.

Table 4

Tablet Strength Moexipril Hydrochloride/ Hydrochlorothiazide (mg/mg)	Number of Tablets (NLT)	Nominal Concentration of Moexipril Hydrochloride (mg/mL)	Nominal Concentration of Hydrochlorothiazide (mg/mL)
7.5/12.5	20	1.2	2
15/12.5	10	1.8	1.5
15/25	10	1.2	2

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.5 between the moexipril and moexipril related compound G peaks, *System suitability solution*

Tailing factor: NMT 2.0 for both moexipril and hydrochlorothiazide peaks, *Standard solution*

Relative standard deviation: NMT 5.0% for both moexipril and hydrochlorothiazide peaks, *Standard solution*

Analysis**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of moexipril related compound A and moexipril related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of moexipril related compound A or moexipril related compound B from the *Sample solution*

r_S = peak response of USP Moexipril Related Compound A RS or USP Moexipril Related Compound B RS from the *Standard solution*

C_S = concentration of USP Moexipril Related Compound A RS and USP Moexipril Related Compound B RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of moexipril hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of benzothiadiazine related compound A or chlorothiazide in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzothiadiazine related compound A or chlorothiazide from the *Sample solution*

r_S = peak response of benzothiadiazine related compound A or chlorothiazide from the *Standard solution*

C_S = concentration of USP Benzothiadiazine Related Compound A RS or USP Chlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak response of any other individual impurity from the *Sample solution*
 r_s = peak response of moexipril from the *Standard solution*
 C_s = concentration of USP Moexipril Hydrochloride RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of moexipril hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 5.

Molindone Hydrochloride

C₁₆H₂₄N₂O₂ · HCl 312.83

4H-Indol-4-one, 3-ethyl-1,5,6,7-tetrahydro-2-methyl-5-(4-morpholinylmethyl)-, monohydrochloride.

3-Ethyl-6,7-dihydro-2-methyl-5-(morpholinomethyl)indol-4(5H)-one monohydrochloride [15622-65-8].

» Molindone Hydrochloride contains not less than 98.0 percent and not more than 101.5 percent of C₁₆H₂₄N₂O₂ · HCl, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Molindone Hydrochloride RS

Identification—

A: Infrared Absorption (197K). Do not dry specimens.

B: Prepare a solution in methanol containing 10 mg of molindone hydrochloride per mL. Separately apply 1 µL of this solution and 1 µL of a Standard solution containing 10 mg per mL of USP Molindone Hydrochloride RS in methanol to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow the spots to dry. Protect the chromatogram from light, and develop in a solvent system consisting of a mixture of alcohol, methanol, and 1 N hydrochloric acid (90:5:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a freshly prepared solution containing 100 mg of potassium ferricyanide dissolved in 20 mL of 10% ferric chloride solution: the principal spot obtained from the test solution corresponds in R_F value and intensity to that obtained from the Standard solution.

C: It responds to the tests for *Chloride* (191).

pH (791): between 4.0 and 5.0, in a solution (1 in 100).

Water Determination, Method I (921): not more than 0.5%.

Residue on ignition (281): not more than 0.25%.

Delete the following:

• **Heavy metals, Method II** (231): not more than 0.003%.

• (Official 1-Jan-2018)

Chromatographic purity—

Mobile phase—Dissolve 1.1 g of sodium octanesulfonate in 600 mL of water, add 400 mL of methanol, 1 mL of glacial acetic acid, and 0.5 mL of triethylamine. Mix, filter through a filter having a porosity of 0.45 μ m or less, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Solvent mixture—Proceed as directed in the Assay.

Standard solution—Prepare a solution of USP Molindone Hydrochloride RS in *Solvent mixture* having a known concentration of about 0.01 mg per mL.

Test solution—Transfer about 100 mg of Molindone Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solvent mixture* to volume.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 25-cm column that contains packing L11. The column temperature is maintained at 35°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses of all peaks: no peak from the *Test solution*, other than the molindone peak, is greater than the molindone peak from the *Standard preparation* (0.5%), and the sum of all the impurity peaks is not greater than 2.0%.

Assay—

Mobile phase—Dissolve 1.1 g of sodium octanesulfonate in 480 mL of water, add 520 mL of methanol, 2 mL of glacial acetic acid, and 0.4 mL of triethylamine. Mix, filter through a 0.45- μ m filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Solvent mixture—Prepare a mixture of 0.01 N hydrochloric acid and methanol (60:40).

Internal standard solution—Dissolve 200 mg of butylparaben in 40 mL of methanol in a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard preparation—Transfer about 25 mg of USP Molindone Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

Assay preparation—Transfer about 50 mg of Molindone Hydrochloride, accurately weighed, to a 100-mL volumetric flask. Add 10.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 25-cm column that contains packing L11. The column temperature is maintained at 35°. The flow rate is 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution, R , between the molindone and butylparaben peaks is not less than 2, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for molindone and 1.0 for

butylparaben. Calculate the quantity, in mg, of $C_{16}H_{24}N_2O_2 \cdot HCl$ in the portion of Molindone Hydrochloride taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Molindone Hydrochloride RS in the *Standard preparation*, and R_U and R_S are the ratios of the peak response of molindone to that of butylparaben obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Molindone Hydrochloride Tablets

» Molindone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of molindone hydrochloride ($C_{16}H_{24}N_2O_2 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Molindone Hydrochloride RS

Identification—Dissolve a portion of finely powdered Tablets in methanol to obtain a test solution containing about 2.5 mg of molindone hydrochloride per mL. Separately apply 5 μ L of the test solution and 5 μ L of a *Standard solution* of USP Molindone Hydrochloride RS in methanol containing 2.5 mg per mL to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, protect the chromatogram from light, and develop in a solvent system consisting of a mixture of alcohol and 1 N hydrochloric acid (95:5). Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by spraying with Dragendorff's reagent, prepared as directed for *Visualization Technique 3* under *Ordinary Impurities* (466): the R_f value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

Uniformity of dosage units (905): meet the requirements.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Solvent A—Mix 300 mL of methanol and 700 mL of 0.1 N hydrochloric acid.

Solvent B—Mix 75 mL of methanol and 25 mL of 0.1 N hydrochloric acid.

Standard solution—Transfer about 100 mg of USP Molindone Hydrochloride RS, accurately weighed, to a 250-mL volumetric flask, and dissolve in and dilute with *Solvent A* to volume. Pipet 5.0 mL of this stock solution into a 250-mL volumetric flask, and dilute with *Solvent A* to volume. Pipet 15.0 mL of the diluted stock solution into a 50-mL volumetric flask, and dilute with *Solvent A* to volume.

Test solution—Withdraw a portion of the solution under test, and filter, discarding the first 3 mL of filtrate. Pipet 15.0 mL of this solution into a 25-mL volumetric flask, and dilute with *Solvent B* to volume.

Mobile phase—Dissolve 1.08 g of sodium 1-octanesulfonate in 480 mL of water. Add 520 mL of methanol, 2.0 mL of acetic acid, and 0.4 mL of triethylamine, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm UV detec-

tor and a 4.6-mm × 25-cm column that contains packing L11. The flow rate is about 1.5 mL per minute.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak heights. Determine the amount of molindone hydrochloride ($C_{16}H_{24}N_2O_2 \cdot HCl$) dissolved.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{16}H_{24}N_2O_2 \cdot HCl$ is dissolved in 30 minutes.

Assay—

Mobile phase, Solvent mixture, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Molindone Hydrochloride.

Assay preparation—Accurately weigh not less than 20 Tablets, grind the Tablets to a homogeneous mixture, and transfer an accurately weighed portion, equivalent to about 50 mg of molindone hydrochloride, to a 250-mL conical flask. Add 10.0 mL of *Internal standard solution* and 90.0 mL of *Solvent mixture*, shake for 30 minutes, and filter.

Procedure—Proceed as directed for *Procedure* in the Assay under Molindone Hydrochloride. Calculate the quantity, in mg, of molindone hydrochloride ($C_{16}H_{24}N_2O_2 \cdot HCl$) in the portion of Tablets taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Molindone Hydrochloride RS in the *Standard preparation*, and R_U and R_S are the ratios of the peak response of molindone to that of butylparaben obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mometasone Furoate

$C_{27}H_{30}Cl_2O_6$ 521.43
Pregna-1,4-diene-3,20-dione, 9,21-dichloro-17-[(2-furanylcarbonyl)oxy]-11-hydroxy-16-methyl-, (11β,16α)-; 9,21-Dichloro-11β,17-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione 17-(2-furoate) [83919-23-7].

DEFINITION

Mometasone Furoate contains NLT 97.0% and NMT 102.0% of mometasone furoate ($C_{27}H_{30}Cl_2O_6$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Methanol and water (65:35)

Diluent: Methanol, acetic acid, and water (65:0.2:35)

Internal standard solution: 0.4 mg/mL of

beclomethasone dipropionate in *Diluent*

Standard stock solution: 0.1 mg/mL of USP

Mometasone Furoate RS, prepared by dissolving USP

Mometasone Furoate RS in methanol and diluting

quantitatively and stepwise, if necessary, with *Diluent*

Standard solution: 0.02 mg/mL of USP Mometasone Furoate RS and 0.08 mg/mL of beclomethasone dipropionate, prepared by pipetting equal volumes of *Standard stock solution* and *Internal standard solution* into a suitable volumetric flask and diluting with *Diluent* to volume, if necessary

Sample stock solution: 0.1 mg/mL of mometasone furoate, prepared by dissolving Mometasone Furoate in methanol and diluting quantitatively and stepwise, if necessary, with *Diluent*

Sample solution: 0.02 mg/mL of mometasone furoate and 0.08 mg/mL of beclomethasone dipropionate, prepared by pipetting 10 mL each of *Sample stock solution* and *Internal standard solution* into a 50-mL volumetric flask and diluting with *Diluent* to volume

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L7

Flow rate: 1.7 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for mometasone furoate and beclomethasone dipropionate are about 1.0 and 1.6, respectively.]

Suitability requirements

Resolution: NLT 4.0 between the mometasone furoate and beclomethasone dipropionate peaks

Tailing factor: NMT 1.8 for the mometasone furoate peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mometasone furoate ($C_{27}H_{30}Cl_2O_6$) in the portion of Mometasone Furoate taken:

$$\text{Result} = (R_U / R_S) \times (C_S / C_U) \times 100$$

R_U = peak response ratio of mometasone furoate to the internal standard from the *Sample solution*

R_S = peak response ratio of mometasone furoate to the internal standard from the *Standard solution*

C_S = concentration of USP Mometasone Furoate RS in the *Standard solution* (mg/mL)

C_U = concentration of Mometasone Furoate in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 30 µg/g (Official 1-Jan-2018)

ORGANIC IMPURITIES

Standard stock solution: 10 mg/mL of USP

Mometasone Furoate RS in dichloromethane

Standard solution A (5%): 0.5 mg/mL of USP

Mometasone Furoate RS in dichloromethane from the *Standard stock solution*

Standard solution B (2%): 0.2 mg/mL of USP

Mometasone Furoate RS in dichloromethane, from the *Standard stock solution*

Standard solution C (1%): 0.1 mg/mL of USP

Mometasone Furoate RS in dichloromethane, from the *Standard stock solution*

Standard solution D (0.2%): 0.02 mg/mL of USP Mometasone Furoate RS in dichloromethane, from the *Standard stock solution*

Standard solution E (0.1%) 0.01 mg/mL of USP Mometasone Furoate RS in dichloromethane, from the *Standard stock solution*

Sample solution: 10 mg/mL of Mometasone Furoate in dichloromethane

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 40 μ L

Developing solvent system: Chloroform and ethyl acetate (3:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Proceed as directed in the chapter. Examine the plate under short-wavelength UV light. Compare the intensities of any secondary spots from the *Sample solution* with those of the principal spots from the *Standard solutions*.

Acceptance criteria: No secondary spot from the *Sample solution* is larger or more intense than the principal spot from *Standard solution C*; and the sum of the intensities of the secondary spots from the *Sample solution* is NMT 2.0%.

SPECIFIC TESTS

• OPTICAL ROTATION, *Specific Rotation* (7815)

Sample solution: 5 mg/mL in dioxane

Acceptance criteria: +56° to +62°

• LOSS ON DRYING (731)

Analysis: Dry a sample at 105° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Mometasone Furoate RS

Mometasone Furoate Cream

DEFINITION

Mometasone Furoate Cream is Mometasone Furoate in a suitable cream base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of mometasone furoate ($C_{27}H_{30}Cl_2O_6$).

IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the *Assay*.

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 0.2 mg/mL of USP Mometasone Furoate RS in acetonitrile

Sample solution: 0.2 mg/mL of mometasone furoate from Cream in acetonitrile

Developing solvent system: Chloroform and ethyl acetate (3:1)

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

• PROCEDURE

[NOTE—Protect from light.]

Diluent A: Tetrahydrofuran and glacial acetic acid (100:1)

Diluent B: Acetonitrile, water, and glacial acetic acid (50:50:1)

Solution A: Water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
2	70	30
45	45	55
46	70	30
50	70	30

Internal standard solution: 1.4 mg/mL of diethyl phthalate in acetonitrile

Standard stock solution: 0.2 mg/mL of USP Mometasone Furoate RS in *Diluent A*

Standard solution: 0.05 mg/mL of mometasone furoate and 0.35 mg/mL of diethyl phthalate from equal quantities of the *Standard stock solution* and the *Internal standard solution*, in *Diluent B*

Sample solution: Transfer a portion of Cream, equivalent to 1.0 mg of mometasone furoate, to a 50-mL, screw-capped centrifuge tube. Add 5.0 mL of *Diluent A* and a few glass beads, and mix on a vortex mixer. Add 5.0 mL of *Internal standard solution*, and mix. Add 10.0 mL of *Diluent B*, mix on a vortex mixer for 1 min, and centrifuge for 10 min. Pass the aqueous phase through a polypropylene filter of 0.2- μ m pore size, discarding the first 1–2 mL of filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L60

Flow rate: 2 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for diethyl phthalate and mometasone furoate are 0.4 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 1.5 for the mometasone furoate peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mometasone furoate ($C_{27}H_{30}Cl_2O_6$) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the mometasone furoate peak response to the diethyl phthalate peak response from the *Sample solution*

R_S = ratio of the mometasone furoate peak response to the diethyl phthalate peak response from the *Standard solution*

C_S = concentration of USP Mometasone Furoate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mometasone furoate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

IMPURITIES

• ORGANIC IMPURITIES

[NOTE—Protect from light.]

Diluent A, Solution A, Solution B, Mobile phase, and Standard stock solution: Prepare as directed in the Assay.

Diluent C: Acetonitrile, water, and glacial acetic acid (30:70:1)

System suitability solution: 0.1 µg/mL of USP

Mometasone Furoate RS from *Standard stock solution* in *Diluent C*

Blank solution: *Diluent C* and *Diluent A* (3:1)

Sample solution: Transfer a portion of Cream, equivalent to 2.0 mg of mometasone furoate, to a 50-mL, screw-capped centrifuge tube. Add 5.0 mL of *Diluent A* and a few glass beads, and mix on a vortex mixer. Add 15.0 mL of *Diluent C*, and mix. Centrifuge for 10 min. Pass the aqueous phase through a 0.2-µm polypropylene filter, discarding the first 1–2 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L60

Column temperature: 25 ± 5°

Flow rate: 2 mL/min

Injection size: 50 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Relative standard deviation: NMT 10%

Analysis

Samples: *System suitability solution*, *Blank solution*, and *Sample solution*

[NOTE—Exclude any peak areas less than those from the *System suitability solution*. Also exclude any peaks with the same retention time as that observed in the *Blank solution*. Any peaks having a relative retention time of about 1.04 or 1.13 are controlled in the *Mometasone Furoate* monograph and, therefore, are not included in the total specified and unspecified impurities limit.]

Calculate the percentage of each impurity in the portion of Cream taken:

$$\text{Result} = (r_u/r_r) \times 100$$

r_u = peak response of each impurity from the *Sample solution*

r_r = sum of all the peak responses from the *Sample solution*

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
9α-Chloro-11β,17,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione 17-(2-furoate)	0.56	0.1
9α,21-Dichloro-11β,17-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione	0.73	0.1

Table 2 (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
21-Chloro-9β,11β-epoxy-17-hydroxy-16α-methylpregna-1,4-diene-3,20-dione 17-(2-furoate)	0.94	1.0
Mometasone furoate	1.0	—
Unspecified individual impurity	—	0.2
Total specified and unspecified impurities	—	1.0

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Mometasone Furoate RS

Mometasone Furoate Ointment

DEFINITION

Mometasone Furoate Ointment is Mometasone Furoate in a suitable ointment base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of mometasone furoate ($C_{27}H_{30}Cl_2O_6$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the Assay.

- **B. THIN-LAYER CHROMATOGRAPHY**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Standard solution: 0.6 mg/mL of USP Mometasone Furoate RS in methanol

Sample solution: Transfer the equivalent to 3 mg of mometasone furoate from Ointment to a 50-mL screw-capped centrifuge tube. Pipet 5.0 mL of methanol into the tube, and attach the cap. Heat in a steam bath until the Ointment completely melts, and shake vigorously until the Ointment resolidifies. Place in an ice-water bath for 10 min. Centrifuge, and filter a portion of the supernatant. Extract 1 mL of the filtrate with 1 mL of hexane, and use the lower phase.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system A: Methanol

Developing solvent system B: Chloroform and ethyl acetate (3:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Allow the spots to dry, and develop the chromatogram in *Developing solvent system A* until the solvent front has moved 2 cm from the origin. Remove the plate from the developing chamber, and air-dry. Develop the chromatogram in *Developing solvent system B* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the spots to air-dry. Examine the plate under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

Internal standard solution: 1.4 mg/mL of diethyl phthalate in acetonitrile

Standard stock solution: 0.2 mg/mL of USP Mometasone Furoate RS in *Diluent A*

Standard solution: 0.05 mg/mL of mometasone furoate and 0.35 mg/mL of diethyl phthalate from equal quantities of the *Standard stock solution* and the *Internal standard solution*, in *Diluent B*

Sample solution: Transfer a portion of Ointment, equivalent to 1.0 mg of mometasone furoate, to a 50-mL screw-capped centrifuge tube. Add 5.0 mL of *Diluent A* and a few glass beads, and mix on a vortex mixer. Add 5.0 mL of *Internal standard solution*, and mix. Add 10.0 mL of *Diluent B*, mix on a vortex mixer for 1 min, and centrifuge for 10 min. Pass the aqueous phase through a polypropylene filter of 0.2- μ m pore size, discarding the first 1–2 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L60

Flow rate: 2 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for diethyl phthalate and mometasone furoate are 0.4 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 1.5 for the mometasone furoate peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mometasone furoate ($C_{27}H_{30}Cl_2O_6$) in the portion of Ointment taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the mometasone furoate peak response to the diethyl phthalate peak response from the *Sample solution*

R_S = ratio of the mometasone furoate peak response to the diethyl phthalate peak response from the *Standard solution*

C_S = concentration of USP Mometasone Furoate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mometasone furoate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

ORGANIC IMPURITIES

[NOTE—Protect from light.]

Diluent A, Solution A, Solution B, Mobile phase, and Standard stock solution: Prepare as directed in the Assay.

Diluent C: Acetonitrile, water, and glacial acetic acid (30:70:1)

System suitability solution: 0.1 μ g/mL of USP Mometasone Furoate RS from *Standard stock solution* in *Diluent C*

Sample solution: Transfer a portion of Ointment, equivalent to 2.0 mg of mometasone furoate, to a 50-mL screw-capped centrifuge tube. Add 5.0 mL of *Diluent A* and a few glass beads, and mix on a vortex mixer. Add 15.0 mL of *Diluent C*, and mix. Centrifuge for 10 min. Pass the aqueous phase through a polypropylene filter of 0.2- μ m pore size, discarding the first 1–2 mL of filtrate.

Blank solution: *Diluent C* and *Diluent A* (3:1)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L60

Column temperature: 25 \pm 5°

Flow rate: 2 mL/min

Injection size: 50 μ L

System suitability

Sample: *System suitability solution*

Suitability requirements

Relative standard deviation: NMT 10%

Analysis

Samples: *System suitability solution*, *Sample solution*, and *Blank solution*

[NOTE—Exclude any peak areas less than those from the chromatogram of the *System suitability solution*. Also exclude any peaks with the same retention time as that observed in the chromatogram of the *Blank solution*. Any peaks having a relative retention time of about 1.04 or 1.13 are controlled in the monograph for Mometasone Furoate, and therefore are not included in the total specified and unspecified impurities limit.]

Calculate the percentage of each impurity in the portion of Ointment taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
9 α -Chloro-11 β ,17,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione 17-(2-furoate)	0.56	0.2
9 α ,21-Dichloro-11 β ,17-dihydroxy-16 α -methylpregna-1,4-diene-3,20-dione	0.73	0.2

Mometasone furoate	1.0	—
Unspecified individual impurity	—	0.2
Total specified and unspecified impurities	—	1.0

PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Mometasone Furoate RS

Mometasone Furoate Topical Solution**DEFINITION**

Mometasone Furoate Topical Solution is Mometasone Furoate in a suitable aqueous vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of mometasone furoate ($C_{27}H_{30}Cl_2O_6$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the Assay.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
Standard solution: 1 mg/mL of USP Mometasone Furoate RS in a mixture of chloroform and methanol (4:1)
Sample solution: Transfer the equivalent of 2 mg of mometasone furoate from Topical Solution to a 50-mL centrifuge tube. Add 10 mL of water. Extract the aqueous solution with 20 mL of chloroform. Remove the chloroform layer, dry over anhydrous sodium sulfate, and filter through a cotton pledget. Repeat the chloroform extraction, and combine the dried extracts. Evaporate the chloroform solution to dryness on a steam bath under a stream of nitrogen. Allow the sample specimen to cool to room temperature. Dissolve the residue in a mixture of chloroform and methanol (4:1) to obtain 1 mg/mL of *Sample solution*.
Application volume: 20 μ L
Developing solvent system: Chloroform and ethyl acetate (3:1)
Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to the that of the *Standard solution*.

ASSAY• **PROCEDURE**

[NOTE—Protect from light.]

Diluent: Acetonitrile, water, and glacial acetic acid (50:50:1)

Solution A: Water

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
2	70	30
45	45	55
46	70	30
50	70	30

Standard solution: 0.1 mg/mL of USP Mometasone Furoate RS in *Solution B*

Sample solution: Transfer a portion of Topical Solution, equivalent to about 2.5 mg of mometasone furoate, to a 25-mL flask. Dilute with *Diluent* to volume, and mix. Pass a portion of the solution through a polypropylene filter of 0.2- μ m pore size, discarding the first 1–2 mL of filtrate.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Mometasone Furoate RS

MonensinC₃₆H₆₂O₁₁(monensin A) 670.87C₃₅H₆₀O₁₁(monensin B) 656.84C₃₇H₆₄O₁₁(monensin C) 684.90

Monensin.

Stereoisomer of 2-[2-ethyloctahydro-3'-methyl-5'-[tetrahydro-6-hydroxy-6-(hydroxymethyl)-3,5-dimethyl-2H-pyran-2-yl][2,2'-bifuran-5-yl]-9-hydroxy-β-methoxy-α,γ,2,8-tetramethyl-1,6-dioxaspiro[4.5]decan-7-butanoic acid [17090-79-8].

» Monensin is a mixture of antibiotic substances produced by the growth of *Streptomyces cinnamonensis*. It has a potency of not less than 110 μg of monensin per mg.

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

Labeling—Label it to indicate that it is for veterinary use only. Label it also to state that it is for manufacturing, processing, or repackaging.

USP Reference standards (11)—

USP Monensin Sodium RS

USP Narasin RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for monensin A and a minor peak for monensin B, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 2 hours: it loses not more than 10% of its weight.

Content of monensin A and B activity—Using the results of the calculations in the *Assay*, calculate the percentage of monensin A activity in the Monensin under test by the formula:

$$100A / P$$

in which *A* is the potency, in μg per mg, of monensin A in the Monensin under test, as determined in the *Assay*, and *P* is the potency, in μg of monensin, in each mg of the Monensin under test, as determined in the *Assay*: not less than 90% is found. Calculate the percentage of monensin A activity plus monensin B activity in the Monensin under test by the formula:

$$100(A + B) / P$$

in which *B* is the potency, in μg per mg, of monensin B in the Monensin under test, as determined in the *Assay*, and the other terms are as defined above: not less than 95% is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of methanol, water, and glacial acetic acid (94:6:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Neutralized methanol—Add 1 g of sodium bicarbonate to 4 liters of methanol, mix, and filter.

Diluent—Prepare a mixture of methanol and water (9:1).

Derivatizing reagent—Dissolve 3 g of vanillin in a mixture of 95 mL of methanol and 2 mL of sulfuric acid. [Caution—To avoid splattering, add the sulfuric acid carefully and slowly with a pipet; do not pour. Allow the mixture of methanol and sulfuric acid to cool before adding vanillin.]

Standard preparation—Dissolve an accurately weighed quantity of USP Monensin Sodium RS quantitatively in methanol to obtain a solution containing the equivalent of 1000 µg of monensin per mL. Dilute an accurately measured volume of this stock solution quantitatively with *Diluent* to obtain a solution containing 20.0 µg of monensin per mL.

Assay preparation—Transfer about 500 mg of Monensin, accurately weighed, to a 250-mL flask, add 200.0 mL of *Diluent*, and shake by mechanical means for 1 hour. Allow the solids to settle, and dilute an accurately measured volume of the supernatant quantitatively with *Diluent* to obtain a solution containing about 20 µg of monensin per mL.

Resolution solution—Prepare a solution in *Neutralized methanol* containing about 1 mg of USP Monensin Sodium RS and 3 mg of USP Narasin RS per mL. Transfer 2 mL of this solution to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 4.6-mm × 25-cm column that contains packing L1 and the outlet of which is attached to a tee, the opposing arm of which is attached to a tube from which is pumped the *Derivatizing reagent*, and the outlet of which is connected to a 2-mL postcolumn reaction coil maintained at 98°. The outlet of the reaction coil is connected to a detector set at 520 nm. The *Mobile phase* and the *Derivatizing reagent* flow at the rate of about 0.7 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.9 for monensin B, 1.0 for monensin A, 1.3 for narasin A, and 1.5 for narasin I, the resolution, *R*, between the monensin B peak and the monensin A peak is not less than 1.25, and between the monensin A peak and the narasin A peak is not less than 3.5. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factor is not more than 1.4, and the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—After use, flush the system with methanol.]

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 200 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks, including a peak for monensin C/D, if present, at a retention time of about 1.1 relative to that of the main monensin A peak in the chromatogram obtained from the *Assay preparation*. Calculate the quantity, in µg, of monensin A in each mg of the Monensin taken by the formula:

$$(CFD / 100,000W)(r_u / r_s)$$

in which *C* is the concentration, in µg per mL, of monensin activity in the *Standard preparation*, based on the quantity of USP Monensin Sodium RS taken, its designated potency, in µg per mg, and the extent of dilution, *F* is the designated percentage of monensin A in USP Monensin Sodium RS, *D* is the dilution factor used in preparing the *Assay preparation*, *W* is the quantity, in g, of Monensin taken to prepare the *Assay preparation*, and *r_u* and *r_s* are the monensin A peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in µg, of monensin B in each mg of the Monensin taken by the same formula, except that *r_u* is the monensin B peak response obtained from the *Assay preparation* and *r_s* is the

monensin A peak response obtained from the *Standard preparation*. Calculate the quantity, in µg, of monensin C/D in each mg of the Monensin taken by the same formula, except that *r_u* is the monensin C/D peak response obtained from the *Assay preparation*. Calculate the potency, in µg of monensin, in each mg of the Monensin taken by the formula:

$$A + 0.28B + 1.5C / D$$

in which *A* is the quantity, in µg, of monensin A in each mg of the Monensin taken, as calculated above, and *B* is the quantity, in µg, of monensin B in each mg of the Monensin taken, and *C/D* is the quantity, in µg, of monensin C/D in each mg of Monensin taken, as calculated above.

Monensin Granulated

» Monensin Granulated contains Monensin mixed with suitable diluents, carriers, and inactive ingredients prepared in a granulated form that is free-flowing and free from aggregates. It may contain added Monensin Sodium. It contains not less than 140 mg of monensin per g.

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

Labeling—Label it to indicate that it is for veterinary use only. Label it also to state that it is for manufacturing, processing, or repackaging.

USP Reference standards (11)—

USP Monensin Sodium RS

USP Narasin RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for monensin A and a minor peak for monensin B, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 2 hours: it loses not more than 10% of its weight.

Content of monensin A and B activity—Using the results of the calculations in the *Assay*, calculate the percentage of monensin A activity in the Monensin Granulated under test by the formula:

$$100A / P$$

in which *A* is the potency, in µg per mg, of monensin A in the Monensin Granulated under test, as determined in the *Assay*, and *P* is the potency, in µg of monensin, in each mg of the Monensin Granulated under test, as determined in the *Assay*: not less than 90% is found. Calculate the percentage of monensin A activity plus monensin B activity in the Monensin Granulated under test by the formula:

$$100(A + B) / P$$

in which *B* is the potency, in µg per mg, of monensin B in the Monensin Granulated under test, as determined in the *Assay*, and the other terms are as defined above: not less than 95% is found.

Assay—

Mobile phase, *Neutralized methanol*, *Diluent*, *Derivatizing reagent*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under Monensin.

Assay preparation—Transfer about 5 g of Monensin Granulated, accurately weighed, to a 250-mL flask, add 200.0 mL

of *Diluent*, and shake by mechanical means for 1 hour. Allow the solids to settle, and dilute an accurately measured volume of the supernatant quantitatively with *Diluent* to obtain a solution containing about 20 µg of monensin per mL.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Monensin*. Calculate the quantity, in mg, of monensin A in each g of the Monensin Granulated taken by the formula:

$$(CFD / 100,000W)(r_u / r_s)$$

in which C is the concentration, in µg per mL, of monensin activity in the *Standard preparation*, based on the quantity of USP Monensin Sodium RS taken, its designated potency, in µg per mg, and the extent of dilution, F is the designated percentage of monensin A in USP Monensin Sodium RS, D is the dilution factor used in preparing the *Assay preparation*, W is the quantity, in g, of Monensin Granulated taken to prepare the *Assay preparation*, and r_u and r_s are the monensin A peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of monensin B in each g of the Monensin Granulated taken by the same formula, except that r_u is the monensin B peak response obtained from the *Assay preparation* and r_s is the monensin A peak response obtained from the *Standard preparation*. Calculate the quantity, in mg, of monensin C/D in each g of the Monensin Granulated taken by the same formula, except that r_u is the monensin C/D peak response obtained from the *Assay preparation*. Calculate the potency, in µg of monensin, in each mg of the Monensin Granulated taken by the formula:

$$A + 0.28B + 1.5C / D$$

in which A is the quantity, in mg, of monensin A in each g of the Monensin Granulated taken, as calculated above, and B is the quantity, in mg, of monensin B in each g of the Monensin Granulated taken, and C/D is the quantity, in mg, of monensin C/D in each g of Monensin Granulated taken, as calculated above.

Monensin Premix

» Monensin Premix contains Monensin Granulated mixed with suitable diluents and inactive ingredients. It contains the equivalent of not less than 85.0 percent and not more than 115.0 percent of the labeled amount of monensin.

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

Labeling—Label it to indicate that it is for veterinary use only. The label bears the statement "Do not feed undiluted."

USP Reference standards (11)—

USP Monensin Sodium RS

USP Narasin RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for monensin A and a minor peak for monensin B, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 2 hours: it loses not more than 10% of its weight.

Assay—

Mobile phase, Neutralized methanol, Diluent, Derivatizing reagent, Standard preparation, Resolution solution, and Chro-

matographic system—Proceed as directed in the *Assay* under *Monensin*.

Assay preparation—Transfer about 5 g of Premix, accurately weighed, to a 250-mL flask, add 200.0 mL of *Diluent*, and shake by mechanical means for 1 hour. Allow the solids to settle, and dilute an accurately measured volume of the clear supernatant quantitatively with *Diluent* to obtain a solution containing about 20 µg of monensin per mL.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Monensin*. Calculate the quantity, in mg, of monensin A in each g of the Premix taken by the formula:

$$(CFD / 100,000W)(r_u / r_s)$$

in which C is the concentration, in µg per mL, of monensin activity in the *Standard preparation*, based on the quantity of USP Monensin Sodium RS taken, its designated potency, in µg per mg, and the extent of dilution, F is the designated percentage of monensin A in USP Monensin Sodium RS, D is the dilution factor used in preparing the *Assay preparation*, W is the quantity, in g, of Premix taken to prepare the *Assay preparation*, and r_u and r_s are the monensin A peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of monensin B in each g of the Premix taken by the same formula, except that r_u is the monensin B peak response obtained from the *Assay preparation* and r_s is the monensin A peak response obtained from the *Standard preparation*. Calculate the quantity, in mg, of monensin C/D in each g of the Premix taken by the same formula, except that r_u is the monensin C/D peak response obtained from the *Assay preparation*. Calculate the potency, in mg of monensin, in each g of the Premix taken by the formula:

$$A + 0.28B + 1.5C / D$$

in which A is the quantity, in mg, of monensin A in each g of the Premix taken, as calculated above, and B is the quantity, in mg, of monensin B in each g of the Premix taken, and C/D is the quantity, in mg, of monensin C/D in each g of Premix taken, as calculated above.

Monensin Sodium

C₃₆H₆₁NaO₁₁ (monensin A sodium) 692.85

C₃₅H₅₉NaO₁₁ (monensin B sodium) 678.83

C₃₇H₆₃NaO₁₁ (monensin C sodium) 706.88

Monensin, sodium salt.

Stereoisomer of 2-[2-ethyloctahydro-3'-methyl-5'-

[tetrahydro-6-hydroxy-6-(hydroxymethyl)-3,5-dimethyl-2H-pyran-2-yl][2,2'-bifuran-5-yl]-9-hydroxy-β-methoxy-α, γ,2,8-tetramethyl-1,6-dioxaspiro[4.5]decan-7-butanoic acid sodium salt [22373-78-0].

» Monensin Sodium has a potency of not less than 800 µg per mg.

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

Labeling—Label it to indicate that it is for veterinary use only. Label it also to state that it is for manufacturing, processing, or repackaging.

USP Reference standards (11)—

USP Monensin Sodium RS

USP Narasin RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for monensin A and a minor peak for monensin B, the retention times of which correspond to those exhibited in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 3 hours; it loses not more than 4% of its weight.

Content of monensin A and B activity—Using the results of the calculations in the Assay, calculate the percentage of monensin A activity in the Monensin Sodium under test by the formula:

$$100A / P$$

in which *A* is the potency, in mg per g, of monensin A in the Monensin Sodium under test, as determined in the Assay, and *P* is the potency, in mg of monensin, in each g of the Monensin Sodium under test, as determined in the Assay; not less than 90% is found. Calculate the percentage of monensin A activity plus monensin B activity in the Monensin Sodium under test by the formula:

$$100(A + B) / P$$

in which *B* is the potency, in mg per g, of monensin B in the Monensin Sodium under test, as determined in the Assay, and the other terms are as defined above; not less than 95% is found.

Assay—

Mobile phase, Neutralized methanol, Diluent, Derivatizing reagent, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the Assay under Monensin.

Assay preparation—Transfer about 100 mg of Monensin Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume. If necessary, to achieve complete dissolution, sonicate for about 1 minute, and mix. Dilute an accurately measured volume of this solution quantitatively with *Diluent* to obtain a solution containing about 20 µg of monensin per mL.

Procedure—Proceed as directed for *Procedure* in the Assay under Monensin. Calculate the quantity, in mg, of monensin A in each g of the Monensin Sodium taken by the formula:

$$(CFD / 100,000W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of monensin activity in the *Standard preparation*, based on the quantity of USP Monensin Sodium RS taken, its designated potency, in µg per mg, and the extent of dilution; *F* is the designated percentage of monensin A in USP Monensin Sodium RS; *D* is the dilution factor used in preparing the *Assay preparation*; *W* is the quantity, in g, of Monensin Sodium taken to prepare the *Assay preparation*; and *r_U* and *r_S* are the monensin A peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of monensin B in each g of the Monensin Sodium taken by the same formula, except that *r_U* is the monensin B peak response obtained from the *Assay preparation*, and *r_S* is the monensin A peak response obtained from the *Standard preparation*. Calculate the quantity, in mg, of monensin C/D in each g of the Monensin Sodium taken by the same formula, except that *r_U* is the monensin C/D peak response obtained from the *Assay preparation*. Calculate the potency, in mg of monensin, in each g of the Monensin Sodium taken by the formula:

$$A + 0.28B + 1.5C / D$$

in which *A* is the quantity, in mg, of monensin A in each g of the Monensin Sodium taken, as calculated above; *B* is the quantity, in mg, of monensin B in each g of the Monensin Sodium taken; and *C/D* is the quantity, in mg, of monensin C/D in each g of Monensin Sodium taken, as calculated above.

Monobenzene

$C_{13}H_{12}O_2$ 200.23

Phenol, 4-(phenylmethoxy)-.

p-(Benzyloxy)phenol [103-16-2].

» Monobenzene, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{13}H_{12}O_2$.

Packaging and storage—Preserve in tight, light-resistant containers, and avoid exposure to temperatures above 30°.

USP Reference standards (11)—

USP Monobenzene RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 µg per mL.

Medium: methanol.

Absorptivities at 292 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: Transfer about 500 mg of Monobenzene, previously dried, to a 150-mL flask fitted with a reflux condenser, employing a suitable glass joint. Add 5 mL of pyridine and 3 mL of acetic anhydride, reflux for 10 minutes, and cool. Add 100 mL of water and 6 mL of acetone to the flask, and insert a stopper. Cool the contents of the flask in a refrigerator for 1 hour, collect the precipitate in a sintered-glass crucible, and wash the precipitate with water until no odor of pyridine remains. Dry the precipitate for 16 hours in a vacuum desiccator over phosphorus pentoxide. The monobenzene acetate so obtained melts between 110° and 113° when determined as directed for *Class I* (see *Melting Range or Temperature* (741)).

Melting range, Class I (741): between 117° and 120°.

Loss on drying (731)—Dry it at 105° for 3 hours; it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.5%.

Assay—

Standard preparation—Dissolve an accurately weighed quantity of USP Monobenzene RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 40 µg per mL.

Assay preparation—Transfer about 100 mg of Monobenzene, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 4 mL of this solution into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—With a suitable spectrophotometer, using methanol as a blank, concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 292 nm. Calculate the quantity, in mg, of $C_{13}H_{12}O_2$ in the portion of Monobenzene taken by the formula:

$$2500C(A_U / A_S)$$

in which *C* is the concentration, in mg per mL, of USP Monobenzene RS in the *Standard preparation*; and *A_U* and *A_S* are the absorbances obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Monobenzene Cream

» Monobenzene Cream contains not less than 94.0 percent and not more than 106.0 percent of the labeled amount of monobenzene ($C_{13}H_{12}O_2$).

Packaging and storage—Preserve in tight containers, and avoid exposure to temperatures higher than 30°.

USP Reference standards (11)—
USP Monobenzene RS

Identification—Transfer a quantity of Cream, equivalent to about 500 mg of monobenzene, to a centrifuge bottle, add 100 mL of water, and shake until the cream is completely dispersed. Centrifuge the suspension, decant the supernatant, wash the residue with water, again centrifuge, and decant the water. Transfer the residue to a separator with the aid of water, and adjust the volume to about 100 mL. Extract with four 25-mL portions of chloroform, filtering the extracts through a pledget of cotton into a 150-mL flask. Evaporate the chloroform in a current of warm air, and add 5 mL of pyridine and 3 mL of acetic anhydride to the dry residue. Connect the flask to a reflux condenser, reflux for 10 minutes, cool, and proceed as directed in *Identification* test C under *Monobenzene*, beginning with "Add 100 mL of water." It meets the requirements of *Identification* test C under *Monobenzene*.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Monobenzene*.

Assay preparation—Transfer an accurately weighed portion of Cream, equivalent to about 200 mg of monobenzene, to a suitable container, add 100 mL of methanol, and shake for about 30 minutes. Transfer the mixture to a 200-mL volumetric flask. Rinse the container with two 25-mL portions of methanol, and add the rinsings to the 200-mL volumetric flask. Dilute with methanol to volume, mix, and filter, discarding the first 20 mL of the filtrate. Pipet 4 mL of this solution into a 100-mL volumetric flask, dilute with methanol to volume, and mix.

Procedure—Proceed as directed in the *Assay* under *Monobenzene*, but use the *Assay preparation* under *Monobenzene Cream*. Calculate the quantity, in mg, of monobenzene ($C_{13}H_{12}O_2$) in the portion of Cream taken by the formula:

$$5000C(A_U / A_S)$$

in which *C* is the concentration, in mg per mL, of USP Monobenzene RS in the *Standard preparation* and A_U and A_S are the absorbances obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Montelukast Sodium

$C_{35}H_{35}ClINNaO_3S$ 608.17
Cyclopropaneacetic acid, 1-[[[1-[3-[2-(7-chloro-2-quinolyl)ethenyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]thio]methyl]-, sodium salt, [R-, (E)-];

Sodium 1-[[[1-[(R)-m-[(E)-2-(7-chloro-2-quinolyl)vinyl]-α-[o-(1-hydroxy-1-methylethyl)phenethyl]benzyl]thio]-methyl]cyclopropaneacetate [151767-02-1].

$C_{35}H_{35}ClINNaO_3S$ 586.18
Montelukast [158966-92-8].

DEFINITION

Montelukast Sodium contains NLT 98.0% and NMT 102.0% of $C_{35}H_{35}ClINNaO_3S$, calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

A. INFRARED ABSORPTION (197)

[NOTE—Methods described under *Infrared Absorption* (197K), (197M), or (197A) may be used.]

B. IDENTIFICATION TESTS—GENERAL, Sodium (191)

Sample: 100 mg

Analysis: Ignite the *Sample* in a crucible until an almost white residue is obtained. Take up the residue in 2 mL of water, and filter.

Acceptance criteria: The filtrate meets the requirements of the pyroantimonate precipitate test.

C. Meets the requirements of the test for Enantiomeric Purity.

ASSAY

[NOTE—Avoid exposure of the samples to light. Use low-actinic glassware.]

PROCEDURE

Solution A: Add 1.5 mL of trifluoroacetic acid to 1 L of water.

Solution B: Add 1.5 mL of trifluoroacetic acid to 1 L of acetonitrile.

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the column.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
3.0	60	40
16.0	49	51

Diluent: Methanol and water (9:1)

Standard solution: 0.13 mg/mL of USP Montelukast Dicyclohexylamine RS in *Diluent*

Sample solution: 0.1 mg/mL of Montelukast Sodium in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 238 nm

Column: 4.6-mm × 5-cm; 1.8-μm packing L11

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of montelukast sodium ($C_{35}H_{35}ClINNaO_3S$) in the portion of Montelukast Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast sodium, 608.17

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

Delete the following:

• HEAVY METALS

Diluent: Acetone and water (4:1)

Sample solution: Dissolve 0.50 g of Montelukast Sodium in 20 mL of Diluent.

Reference solution: Dilute 0.5 mL of the *Standard Lead Solution*, prepared as directed under *Heavy Metals* (231), with Diluent to 20 mL.

Blank solution: 20 mL of the Diluent

Analysis: To each solution, add 2 mL of pH 3.5 Acetate Buffer, prepared as directed under *Heavy Metals* (231). Mix, and add to 1.2 mL of thioacetamide–glycerin base TS. Mix immediately, and allow to stand for 2 min. Pass the solutions through a membrane filter of 0.45- μ m pore size. Compare the spots on the filters obtained from the different solutions: the brownish-black color of the spot resulting from the *Sample solution* is not more intense than that of the spot resulting from the *Reference solution*. The test is invalid if the *Reference solution* does not show a brownish-black color compared to the *Blank solution*.

Acceptance criteria: NMT 10 ppm • (Official 1-Jan-2018)

• ORGANIC IMPURITIES

[NOTE—Avoid exposure of the samples to light. Use low-actinic glassware.]

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the Assay.

Impurity solution: 1 mg/mL of USP Montelukast for Peak Identification RS in Diluent

System suitability solution: Transfer 1 mL of the *Impurity solution* to a colorless glass vial, and expose to ambient light for approximately 20 min to generate the *cis*-isomer of montelukast.

Sample solution: 1 mg/mL of Montelukast Sodium in Diluent

Sensitivity solution: 0.5 μ g/mL of Montelukast Sodium in Diluent from the *Sample solution*

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.5 between the *cis*-isomer and montelukast; NLT 1.5 between montelukast and the methylketone impurity, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Montelukast Sodium taken:

$$\text{Result} = (r_u/r_T) \times 100$$

r_u = peak response of each impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria: See Table 2.

Reporting level for impurities: 0.05%

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Acceptance criteria: 90.0%–108.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: 0.5% (w/v) Sodium dodecyl sulfate in water; 900 mL. Do not deaerate.

Apparatus 1: 100 mesh; 50 rpm

Time: 15 min

Solution A: 0.2% (v/v) Trifluoroacetic acid in water

Solution B: 0.2% (v/v) Trifluoroacetic acid in acetonitrile

Mobile phase: *Solution A* and *Solution B* (1:1)

Standard stock solution: 0.33 mg/mL of USP Montelukast Dicyclohexylamine RS in methanol (equivalent to 0.25 mg/mL of montelukast)

Standard solution: (L/900) mg/mL of montelukast in *Medium* from the *Standard stock solution*, where L is the label claim in mg/packet of montelukast

Sample solution: Place the entire contents of one packet in the basket. At the appropriate time point, pass a portion of the solution under test through a suitable filter to obtain a clear solution. Discard the first 10 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 389 nm

Column: 3.0-mm × 10-cm; 5-μm packing L11

Column temperature: 50°

Flow rate: 0.9 mL/min

Injection volume: 25 μL

Run time: 1.5 times the retention time of montelukast

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of montelukast (C₃₅H₃₆ClNO₃S) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of montelukast from the *Sample solution*

r_S = peak response of montelukast from the *Standard solution*

C_S = concentration of montelukast in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/packet)

Tolerances: NLT 85% (Q) of the labeled amount of montelukast (C₃₅H₃₆ClNO₃S) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5% (w/v) Sodium dodecyl sulfate in water; 900 mL

Apparatus 1: 100 mesh; 50 rpm

Time: 15 min

Solution A: 0.07 g/L of monobasic sodium phosphate

Solution B: Acetonitrile

Mobile phase: *Solution A* and *Solution B* (45:55). Add 1.33 mL/L of triethylamine and adjust with phosphoric acid to a pH of 6.7.

Standard stock solution: 0.1 mg/mL of montelukast from montelukast sodium hydrate prepared as follows. Transfer a suitable amount of montelukast sodium hydrate to an appropriate volumetric flask. Dissolve in 4% of the flask volume of methanol and dilute with *Medium* to volume. Determine the water content of montelukast sodium hydrate at the time of use.

Standard solution: 0.004 mg/mL of montelukast in *Medium* from the *Standard stock solution*

Sample solution: Place the entire contents of one packet in the basket. At the appropriate time point, centrifuge a portion of the solution under test.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 5-cm; 1.8-μm packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 100 μL

Run time: 1.5 times the retention time of montelukast

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of montelukast (C₃₅H₃₆ClNO₃S) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of montelukast in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/packet)

Tolerances: NLT 80% (Q) of the labeled amount of montelukast (C₃₅H₃₆ClNO₃S) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Solution A, Solution B, Mobile phase, and System suitability: Proceed as directed in *Dissolution Test 1*.

Standard solution: 26.4 μg/mL of USP Montelukast Dicyclohexylamine RS in methanol

Sample solution: Nominally 0.02 mg/mL of montelukast prepared as follows. Transfer the contents of one packet to a suitable volumetric flask, add 66% of the flask volume of methanol, shake well, and sonicate for 15 min with occasional shaking. Cool to room temperature, dilute with methanol to volume, and mix well. Pass a portion of the resulting solution through a suitable filter of 0.45-μm pore size or centrifuge to obtain a clear solution.

Chromatographic system: Proceed as directed in *Dissolution Test 1*, except use an *Injection volume* of 5 μL.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of montelukast (C₃₅H₃₆ClNO₃S) in the packet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Diluent, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, Sensitivity solution, Sample solution, Chromatographic system,

and **System suitability:** Proceed as directed in the Assay.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual degradation product in the portion of Oral Granules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of any individual degradation product from the *Sample solution*

r_S = peak response of montelukast from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2. Disregard any peak with an area less than that of the *Sensitivity solution*.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- LABELING** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- USP REFERENCE STANDARDS (11)**
USP Montelukast Dicyclohexylamine RS
 $C_{35}H_{36}ClNO_3S \cdot C_{12}H_{23}N$ 767.50

Montelukast Sodium Tablets

DEFINITION

Montelukast Sodium Tablets contain Montelukast Sodium equivalent to NLT 92.5% and NMT 107.5% of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$).

[NOTE—Avoid exposure of samples containing montelukast to light.]

IDENTIFICATION

A. ULTRAVIOLET ABSORPTION (197U)

Diluent: Methanol and water (3:1)

Standard solution: 0.026 mg/mL of USP Montelukast Dicyclohexylamine RS in *Diluent*

Sample solution: Nominally 0.02 mg/mL of montelukast prepared as follows. Transfer one Tablet equivalent to 10 mg of montelukast to a suitable volumetric flask, add 25% of the flask volume of water, and let stand for 5–10 min until the Tablet has disintegrated. Add 60% of the flask volume of methanol, shake well, and sonicate for 70 min with occasional shaking. Cool to room temperature, dilute with methanol to volume, and mix well. Centrifuge a portion of the resulting solution to obtain a clear solution.

Wavelength range: 210–400 nm

Acceptance criteria: The *Sample solution* exhibits maxima only at the same wavelengths as the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Diluent: Methanol and water (3:1)

Solution A: 0.2% (v/v) Trifluoroacetic acid in water

Solution B: Methanol and acetonitrile (3:2)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	48	52
5	45	55
12	45	55
22	25	75
23	25	75
25	48	52
30	48	52

Standard solution: 0.52 mg/mL of USP Montelukast Dicyclohexylamine RS in *Diluent*

System suitability solution: Transfer 10 mL of the *Standard solution* to a clear 10-mL volumetric flask, add 4 μ L of hydrogen peroxide, and mix well. Expose the flask for at least 4 h to ambient light or 10 min to a 4 klx cool white light. [NOTE—Montelukast is partially converted to the *cis*-isomer under these conditions.]

Sensitivity solution: 0.52 μ g/mL of USP Montelukast Dicyclohexylamine RS in *Diluent* from the *Standard solution*

Sample solution: Nominally 0.4 mg/mL of montelukast prepared as follows. Transfer a number of Tablets equivalent to 100 mg of montelukast to a suitable volumetric flask, add 70% of the flask volume of *Diluent*, and sonicate for 30 min. Shake for 30 min on a platform shaker. Dilute with *Diluent* to volume and stir for 30 min. Pass a portion through a suitable filter of 0.45- μ m pore size, discarding the first mL of filtrate. Use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 255 nm

Columns

Guard: 3.0-mm \times 4-mm; packing L11

Analytical: 4.6-mm \times 10-cm; 3- μ m packing L11

Column temperature: 50°

Flow rate: 1.5 mL/min

Injection volume: 15 μ L

Run time: 2 times the retention time of montelukast

System suitability

Samples: *Standard solution*, *System suitability solution*, and *Sensitivity solution*

[NOTE—The relative retention times for the *cis*-isomer and montelukast are about 0.92 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the *cis*-isomer and montelukast, *System suitability solution*

Relative standard deviation: NMT 2% for five injections, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

Acceptance criteria: 92.5%–107.5%

PERFORMANCE TESTS• **DISSOLUTION (711)****Test 1**

Medium: 0.5% (w/v) Sodium dodecyl sulfate in water; 900 mL. Do not deaerate.

Apparatus 2: 50 rpm

Time: 20 min

Solution A: 0.2% (v/v) Trifluoroacetic acid in water

Solution B: 0.2% (v/v) Trifluoroacetic acid in acetonitrile

Mobile phase: *Solution A* and *Solution B* (1:1)

Standard stock solution: 0.35 mg/mL of USP

Montelukast Dicyclohexylamine RS in methanol (equivalent to 0.27 mg/mL of montelukast)

Standard solution: (1/900) mg/mL of montelukast in *Medium* from the *Standard stock solution*, where *L* is the label claim in mg/Tablet of montelukast

Sample solution: Pass a portion of the solution under test through a suitable filter or centrifuge to obtain a clear solution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 389 nm

Column: 3.0-mm \times 10-cm; 5- μ m packing L11

Column temperature: 50°

Flow rate: 0.9 mL/min

Injection volume: 20 μ L

Run time: 1.5 times the retention time of montelukast

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of montelukast in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5% (w/v) Sodium dodecyl sulfate in water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Solution A: 0.07 g/L of monobasic sodium phosphate

Solution B: Acetonitrile

Mobile phase: *Solution A* and *Solution B* (45:55). Add 1.33 mL/L of triethylamine and adjust with phosphoric acid to a pH of 6.7.

Standard stock solution: 0.1 mg/mL of montelukast from montelukast sodium hydrate prepared as follows. Transfer a suitable amount of montelukast sodium hydrate to a suitable volumetric flask. Dissolve in 5% of

the flask volume of methanol and dilute with *Medium* to volume. Determine the water content of montelukast sodium hydrate at the time of use.

Standard solution: 0.01 mg/mL of montelukast in *Medium* from the *Standard stock solution*

Sample solution: Centrifuge a portion of the solution under test.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 5-cm; 1.8-μm packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 100 μL

Run time: 1.5 times the retention time of montelukast

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of montelukast in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.5% (w/v) Sodium dodecyl sulfate in water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Solution A: Acetonitrile and water (80:20)

Solution B: 3% Trifluoroacetic acid in *Solution A* prepared as follows. Transfer 3 mL of trifluoroacetic acid to a 100-mL volumetric flask and dilute with *Solution A* to volume.

Mobile phase: Acetonitrile, water, and *Solution B* (75:25:0.05).

Standard solution: ($L/900$) mg/mL of montelukast in *Medium* from montelukast sodium hydrate, where L is the label claim in mg/Tablet of montelukast. Determine the water content of montelukast sodium hydrate at the time of use.

Sample solution: Pass a portion of the solution under test through a suitable filter to obtain a clear solution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 346 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 25 μL

Run time: NLT 1.5 times the retention time of montelukast

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of montelukast in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Solution A, Solution B, Mobile phase, and System suitability: Proceed as directed in *Dissolution Test 1*.

Diluent: Methanol and water (3:1)

Standard solution: 0.052 mg/mL of USP Montelukast Dicyclohexylamine RS in *Diluent*

Sample solution: Nominally 0.04 mg/mL of montelukast prepared as follows. Transfer one Tablet equivalent to 10 mg of montelukast to a suitable volumetric flask, add 25% of the flask volume of water, and let stand for 5–10 min until the Tablet has disintegrated. Add 60% of the flask volume of methanol, shake well, and sonicate for 70 min with occasional shaking. Cool to room temperature, dilute with methanol to volume, and mix well. Pass a portion of the resulting solution through a suitable filter or centrifuge to obtain a clear solution.

Chromatographic system: Proceed as directed in *Dissolution Test 1*, except use an *Injection volume* of 10 μL.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Diluent, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, Sensitivity solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of any individual degradation product from the *Sample solution*

r_S = peak response of montelukast from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Solution A, Solution B, Mobile phase, and System suitability: Proceed as directed in *Dissolution Test 1*.

Diluent: Methanol and water (3:1)

Standard solution (for 4-mg Chewable Tablets):

0.026 mg/mL of USP Montelukast Dicyclohexylamine RS in *Diluent*

Standard solution (for 5-mg Chewable Tablets):

0.033 mg/mL of USP Montelukast Dicyclohexylamine RS in *Diluent*

Sample solution: Nominally ($L/200$) mg/mL of montelukast, where L is the label claim of montelukast in mg/Chewable Tablet prepared as follows. Transfer 1 Chewable Tablet to a suitable volumetric flask, add 25% of the flask volume of water, and let stand for 5–10 min until the Chewable Tablet has disintegrated. Add 55% of the flask volume of methanol, shake well, and sonicate for 70 min with occasional shaking. Cool to room temperature, dilute with methanol to volume, and mix well. Pass a portion of the resulting solution through a suitable filter or centrifuge to obtain a clear solution.

Chromatographic system: Proceed as directed in *Dissolution Test 1*, except use an *Injection volume* of 10 μ L.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of montelukast ($C_{35}H_{36}ClNO_3S$) in the Chewable Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Diluent, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, Sensitivity solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual degradation product in the portion of Chewable Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of any individual degradation product from the *Sample solution*

r_S = peak response of montelukast from the *Standard solution*

C_S = concentration of USP Montelukast Dicyclohexylamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of montelukast in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of montelukast, 586.18

M_{r2} = molecular weight of montelukast dicyclohexylamine, 767.50

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard any peak with an area less than that of the *Sensitivity solution*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Sulfoxide impurity ^{a,b}	0.45	1.0	1.5
Montelukast ketone impurity ^c	0.71	1.7	0.2

^h 1-[[[1-(R)-1-[3-[(1S)-1-[[[1-(Carboxymethyl)cyclopropyl]methyl]sulfanyl]-2-(7-chloroquinolin-2-yl)ethenyl]phenyl]-3-(2-(1-hydroxy-1-methylethyl)phenyl]propyl]sulfanyl]methyl]cyclopropyl]acetic acid.

ⁱ 1-[[[1-(R)-1-[3-[(E)-2-(7-Chloroquinolin-2-yl)ethenyl]phenyl]-3-(2-(1-methylethyl)phenyl)propyl]sulfanyl]methyl]cyclopropyl]acetic acid.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.

• **LABELING** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

• USP REFERENCE STANDARDS (11)

USP Montelukast Dicyclohexylamine RS
 $C_{35}H_{36}ClNO_3S \cdot C_{12}H_{23}N$ 767.50

Morantel Tartrate

$C_{12}H_{16}N_2S \cdot C_4H_6O_6$ 370.42

Pyrimidine, 1,4,5,6-tetrahydro-1-methyl-2-[2-(3-methyl-2-thienyl)ethenyl]-, (*E*)-, [*R*-(*R**,*R**)]-2,3-dihydroxybutanedioate (1:1).
 (*E*)-1,4,5,6-Tetrahydro-1-methyl-2-[2-(3-methyl-2-thienyl)vinyl]pyrimidine tartrate (1:1) [26155-31-7].
 Morantel [20574-50-9].

» Morantel Tartrate contains not less than 96.4 percent and not more than 101.5 percent of $C_{12}H_{16}N_2S \cdot C_4H_6O_6$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate it is for veterinary use only.

USP Reference standards (11)—

USP Morantel Tartrate RS

Clarity and color of solution—Dissolve and dilute 0.25 g to 25.0 mL in carbon dioxide-free water. The solution is clear and yellow to greenish yellow in color.

Identification—

A: Infrared Absorption (197K).

B: It meets the requirements of the test for *Tartrate* (191).

C: The retention time of the morantel peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of *Standard solution 1*, as obtained in the test for *Related compounds*.

Melting temperature (741): 167° to 172°.

pH (791): between 2.8 and 3.9.

Solution—Dissolve and dilute 0.25 g to 25.0 mL in carbon dioxide-free water.

Loss on drying (731)—Dry it at 100° to 105° to constant weight: it loses not more than 1.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II** (231)—not more than 20 ppm.

• (Official 1-Jan-2018)

Related compounds—[NOTE—Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.]

Mobile phase—Mix 3.5 mL of triethylamine and 850 mL of water. Adjust with phosphoric acid to a pH of 2.5. Add 50 mL of tetrahydrofuran and 100 mL of methanol, and mix.

Tartrate solution—Prepare a solution containing about 0.15 mg of tartaric acid per mL in *Mobile phase*.

Standard solution 1—Dissolve an accurately weighed quantity of USP Morantel Tartrate RS in *Mobile phase* to obtain a solution having a known concentration of about 5.0 µg per mL.

Standard solution 2—Dilute 2.0 mL of *Standard solution 1* to 100.0 mL with *Mobile phase*.

System suitability solution—Expose 10 mL of *Standard solution 1* to daylight for 15 minutes before injection.

Test solution—Dissolve an accurately weighed quantity of Morantel Tartrate in *Mobile phase* to obtain a solution having a concentration of about 0.5 mg per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 226-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 0.75 mL per minute. Chromatograph the *Tartrate solution*, *Standard solution 1*, and the *System suitability solution*, and record the peak areas as directed for *Procedure*: using the *System suitability solution*, the resolution, *R*, between morantel and its preceding peak ((*Z*)-iso-

mer) is not less than 2. The relative retention times are about 0.8, 1.0, and 1.2 for the morantel (*Z*)-isomer, morantel, and the morantel 4-methyl isomer (1-methyl-2-[(*E*)-2-(4-methylthiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine), respectively.

Procedure—Separately inject equal volumes (about 20 µL) of the *Tartrate solution*, *Standard solution 1*, *Standard solution 2*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Disregarding the tartrate peak and any peak in the chromatogram of the *Test solution* less than the area of the principal peak in the chromatogram of *Standard solution 2*, calculate the area percentage of each impurity, relative to morantel, in the portion of Morantel Tartrate taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S and C_U are the concentrations of morantel tartrate, in mg per mL, of *Standard solution 1* and the *Test solution*, respectively; and r_i and r_S are the peak areas of each individual impurity and morantel obtained from the *Test solution* and *Standard solution 1*, respectively: not more than 3% of the morantel 4-methyl isomer is found; not more than 0.5% of any other individual impurity is found; and not more than 1% of total other individual impurities is found.

Assay—

Dissolve 0.280 g in 40 mL of anhydrous acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically (see *Titrimetry* (541)). One mL of 0.1 N perchloric acid is equivalent to 37.04 mg of $C_{12}H_{16}N_2S \cdot C_4H_6O_6$.

Moricizine Hydrochloride

$C_{22}H_{25}N_3O_4S \cdot HCl$ 463.98
 Carbamic acid, [10-[3-(4-morpholinyl)-1-oxopropyl]-10*H*-phenothiazin-2-yl]-, ethyl ester, hydrochloride;
 Ethyl 10-(3-morpholinopropionyl)phenothiazine-2-carbamate, hydrochloride [29560-58-5].

DEFINITION

Moricizine Hydrochloride contains NLT 98.0% and NMT 102.0% of moricizine hydrochloride ($C_{22}H_{25}N_3O_4S \cdot HCl$), calculated on the anhydrous and alcohol-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

ASSAY

- **PROCEDURE:** Use low-actinic glassware. Protect the solutions containing moricizine hydrochloride from light.
Mobile phase: A mixture of acetonitrile, triethylamine, glacial acetic acid, and water (420:1:20:580) containing 5 mM sodium 1-octane sulfonate
Diluent: Acetonitrile and 0.02 N hydrochloric acid (42:58)
Internal standard solution: 5 mg/mL of butamben in *Diluent*

Standard solution: 1 mg/mL of USP Moricizine Hydrochloride RS in *Diluent* prepared as follows. Transfer a suitable amount of USP Moricizine Hydrochloride RS to a suitable volumetric flask, add *Internal standard solution* to fill about 20% of the total volume, and dilute with *Diluent* to volume.

Sample solution: 1 mg/mL of Moricizine Hydrochloride prepared as follows. To a suitable amount of Moricizine Hydrochloride in a 50-mL volumetric flask add *Internal standard solution* to fill about 20% of the total volume, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 35°

Flow rate: 2.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for moricizine, butamben, the reverse Mannich product, and the amide hydrolysis product are about 0.6, 1.0, 1.7, and 2.0, respectively.]

Suitability requirements

Resolution: NLT 2 between moricizine and butamben

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of moricizine hydrochloride ($C_{22}H_{25}N_3O_4S \cdot HCl$) in the portion of Moricizine Hydrochloride taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the moricizine peak area response to the butamben peak area response from the *Sample solution*

R_S = ratio of the moricizine peak area response to the butamben peak area response from the *Standard solution*

C_S = concentration of USP Moricizine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Moricizine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and alcohol-free basis

OTHER COMPONENTS

• CONTENT OF CHLORIDE

Sample solution: Transfer 400 mg of Moricizine Hydrochloride to a conical flask and add 75 mL of methanol. Swirl to dissolve. Add 5 mL of glacial acetic acid and 3 drops of eosin Y TS.

Analysis: Titrate the *Sample solution* with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.546 mg of chloride.

Acceptance criteria: 7.49%–7.80% on the anhydrous and alcohol-free basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.1%

Delete the following:

• HEAVY METALS, Method II (231): NMT 10 µg/g (Official 1-

Jan-2018)

• ORGANIC IMPURITIES

Mobile phase: A mixture of acetonitrile, triethylamine, and water (420:1:580) containing 5 mM sodium 1-oc-

tane sulfonate. Adjust with glacial acetic acid to a pH of 4.2.

Diluent: Acetonitrile and 0.02 N hydrochloric acid (42:58)

Internal standard solution: 0.1 mg/mL of butamben in *Diluent*

Standard stock solution: 0.10 mg/mL of USP Moricizine Hydrochloride RS in *Diluent*

Standard solution: 2.0 µg/mL of USP Moricizine Hydrochloride RS prepared as follows. Transfer a suitable volume of *Standard stock solution* to a suitable volumetric flask, add *Internal standard solution* to fill 5% of the total volume, and dilute with *Diluent* to volume.

[NOTE—Protect the solution from light.]

Sample solution: 1 mg/mL of Moricizine Hydrochloride in *Diluent* prepared as follows. Transfer a suitable amount of Moricizine Hydrochloride to a suitable volumetric flask, add *Internal standard solution* to fill 5% of the total volume, and dilute with *Diluent* to volume.

[NOTE—Protect the solution from light.]

Chromatographic system: Proceed as directed in the *Assay* except for the following:

Run time: Five times the elution time of moricizine

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for moricizine and butamben are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2 between moricizine and butamben

Relative standard deviation: NMT 5%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the responses for all the peaks except the solvent peak.

Calculate the percentage of each impurity in the portion of Moricizine Hydrochloride taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the peak area response of each impurity to the butamben peak area response from the *Sample solution*

R_S = ratio of the peak area response of moricizine to the peak area response of butamben from the *Standard solution*

C_S = concentration of USP Moricizine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: Disregard any impurity of less than 0.1%.

Any impurity eluting before moricizine: NMT 0.25%

Any impurity eluting after moricizine: NMT 0.20%

Total of all impurities: NMT 1.5%

• LIMIT OF ALCOHOL

Standard solution: 0.1184 mg/mL of dehydrated alcohol in water prepared as follows. Transfer 6.0 mL of dehydrated alcohol to a 100-mL volumetric flask and dilute with water to volume. Dilute 5.0 mL of this solution in a 100-mL volumetric flask with water to volume. Further dilute 5.0 mL of this solution in a third 100-mL volumetric flask with water to volume.

Sample solution: Transfer 1 g of Moricizine Hydrochloride to a 50-mL glass-stoppered centrifuge tube, add 19.0 mL of water, and sonicate to dissolve. Transfer 1.0 mL of 3 N ammonium hydroxide to the tube, insert the stopper, and shake the tube by mechanical means for 30 min. Centrifuge, draw off a portion of the clear supernatant, and pass through a suitable filter of 0.5-µm or finer pore size.

USP Moricizine Hydrochloride RS

Moricizine Hydrochloride Tablets

» Moricizine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of moricizine hydrochloride (C₂₂H₂₅N₃O₄S · HCl).

Packaging and storage—Preserve in tight containers.**USP Reference standards** (11)—

USP Moricizine Hydrochloride RS

Identification—**A: Ultraviolet Absorption** (197U)—

Test solution—Transfer a portion of finely ground Tablets, equivalent to about 50 mg of moricizine hydrochloride, to a 250-mL volumetric flask, add about 100 mL of 0.1 N hydrochloric acid, shake by mechanical means for 15 minutes, dilute with 0.1 N hydrochloric acid to volume, and mix. Filter a portion of this solution, discarding the first 10 mL of the filtrate. Transfer 10 mL of the filtrate to a 250-mL volumetric

flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

Standard solution: 8 µg per mL.**Medium:** 0.1 N hydrochloric acid.

B: Shake a Tablet with 10 mL of methanol until it disintegrates, and filter: the filtrate responds to *Identification test C* under *Moricizine Hydrochloride*.

Dissolution (711)—**Medium:** 0.1 N hydrochloric acid; 900 mL.**Apparatus 2:** 50 rpm.**Time:** 30 minutes.

Procedure—Determine the amount of moricizine hydrochloride (C₂₂H₂₅N₃O₄S · HCl) dissolved from UV absorbance at about 267 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a *Standard solution* having a known concentration of USP Moricizine Hydrochloride RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of moricizine hydrochloride (C₂₂H₂₅N₃O₄S · HCl) is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.**Limit of degradation products**—

Mobile phase—Dissolve 1.08 g of sodium 1-octanesulfonate in 580 mL of water, add 420 mL of acetonitrile, 20 mL of glacial acetic acid, and 1 mL of triethylamine. Adjust with 5 N sodium hydroxide to an apparent pH of 4.5. Mix, and filter through a filter having a porosity of 0.5 µm or finer. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluent—Prepare a mixture of 0.02 N hydrochloric acid and acetonitrile (58:42).

Internal standard solution—Prepare a solution of butamben in *Diluent* containing about 0.2 mg per mL.

Standard solution—Prepare a solution of USP Moricizine Hydrochloride RS in *Diluent* containing 0.10 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with *Diluent* to volume, and mix. [NOTE—Protect this solution from light.]

Test solution—Transfer 10 Tablets to a 1000-mL flask, add 500.0 mL of *Diluent*, sonicate until the Tablets are disintegrated, and then shake by mechanical means for 30 minutes. Filter this solution, discarding the first 10 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with *Diluent* to volume, and mix. [NOTE—Protect this solution from light.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7 and is maintained at a constant temperature of about 35°. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.6 for moricizine and 1.0 for butamben, the resolution, R , between the moricizine peak and the butamben peak is not less than 2, and the relative standard deviation for replicate injections is not more than 5%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is five times the elution time of moricizine, and measure the responses for the peaks, except for any that elute before moricizine. Calculate the percentage of each impurity peak that elutes after butamben in the portion of Moricizine Hydrochloride taken by the formula:

$$100(C/L)(R_i/R_S)$$

in which C is the concentration, in mg per mL, of USP Moricizine Hydrochloride RS in the *Standard solution*, L is the

labeled amount, in mg, of moricizine hydrochloride in each Tablet, R_i is the ratio of the peak areas of an individual impurity peak to the butamben peak obtained from the *Test solution*, and R_s is the ratio of the peak areas of the moricizine peak to the butamben peak obtained from the *Standard solution*. The first impurity eluting after the butamben peak is not more than 0.50%, and the second impurity eluting after butamben is not more than 0.25%.

Assay—

Mobile phase, Diluent, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Moricizine Hydrochloride.

Assay preparation—Transfer an accurately counted number of Tablets, equivalent to about 4000 mg of moricizine hydrochloride, to a 2000-mL flask, add 1000.0 mL of *Diluent*, and sonicate until the Tablets have disintegrated. Shake by mechanical means for 30 minutes. Filter a portion of this solution, discarding the first 10 mL of the filtrate. Cover the filter funnel with a watch glass to minimize evaporation of the solvent. Transfer 25.0 mL of the filtrate and 20.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. [NOTE—Protect this solution from light.]

Procedure—Proceed as directed for *Procedure* in the Assay under Moricizine Hydrochloride. Calculate the quantity, in mg, of moricizine hydrochloride ($C_{22}H_{25}N_3O_4 \cdot HCl$) in each Tablet by the formula:

$$4000(C/N)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Moricizine Hydrochloride RS in the *Standard preparation*, N is the number of Tablets taken, and R_U and R_S are the ratios of the peak area responses of the moricizine peak to the butamben peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Morphine Sulfate

$(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ 758.83

Morphinan-3,6-diol, 7,8-didehydro-4,5-epoxy-17-methyl-, (5 α ,6 α)-, sulfate (2:1) (salt), pentahydrate.

7,8-Didehydro-4,5 α -epoxy-17-methylmorphinan-3,6 α -diol sulfate (2:1) (salt) pentahydrate [6211-15-0].

Anhydrous 668.77 [64-31-3].

» Morphine Sulfate contains not less than 98.0 percent and not more than 102.0 percent of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store up to 40° as permitted by the manufacturer.

USP Reference standards (11)—

USP Morphine Sulfate RS

Identification—

A: *Infrared Absorption* (197K): dried at 145° for 1 hour.

B: To 1 mg in a porcelain crucible or small dish add 0.5 mL of sulfuric acid containing, in each mL, 1 drop of formaldehyde TS: an intense purple color is produced at once, and quickly changes to deep blue-violet (*distinction from codeine, which gives at once an intense violet-blue color,*

and from hydromorphone, which gives at first a yellow to brown color, changing to pink and then to purplish red).

C: To a solution of 5 mg in 5 mL of sulfuric acid in a test tube add 1 drop of ferric chloride TS, mix, and heat in boiling water for 2 minutes: a blue color is produced, and when 1 drop of nitric acid is added, it changes to dark red-brown (*codeine and ethylmorphine give the same color reactions, but hydromorphone and papaverine do not produce this color change*).

D: A solution (1 in 50) responds to the tests for Sulfate (191).

Specific rotation (781S): between -107° and -109.5° .

Test solution: the equivalent of 20 mg per mL, in water.

Acidity—Dissolve 500 mg in 15 mL of water, add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide: not more than 0.50 mL is required to produce a yellow color.

Water Determination, Method I (921): between 10.4% and 13.4% is found.

Residue on ignition (281): not more than 0.1%, from 500 mg.

Chloride—To 10 mL of a solution (1 in 100) add 1 mL of 2 N nitric acid and 1 mL of silver nitrate TS: no precipitate or turbidity is produced immediately.

Ammonium salts—Heat 200 mg with 5 mL of 1 N sodium hydroxide on a steam bath for 1 minute: no odor of ammonia is perceptible.

Limit of foreign alkaloids—Dissolve 1.00 g in 10 mL of 1 N sodium hydroxide in a separator, and shake the solution with three successive portions of 15, 10, and 10 mL of chloroform, passing the chloroform solutions through a small filter previously moistened with chloroform. Shake the combined chloroform solutions with 5 mL of water, separate the chloroform layer, and carefully evaporate on a steam bath to dryness. To the residue add 10.0 mL of 0.020 N sulfuric acid, and heat gently until dissolved. Cool, add 2 drops of methyl red TS, and titrate the excess acid with 0.020 N sodium hydroxide: not less than 7.5 mL is required (1.5%).

Assay—

Mobile phase—Dissolve 0.73 g of sodium 1-heptanesulfonate in 720 mL of water, add 280 mL of methanol and 10 mL of glacial acetic acid, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Morphine Sulfate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.24 mg per mL. Prepare a fresh solution daily.

System suitability preparation—Dissolve suitable quantities of USP Morphine Sulfate RS and phenol in *Mobile phase* to obtain a solution containing about 0.24 and 0.15 mg per mL, respectively.

Assay preparation—Transfer about 24 mg of Morphine Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 284-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for phenol and 1.0 for morphine sulfate; the resolution, R , between phenol and morphine sulfate is not less than 2.0; the tailing factor for the morphine sulfate peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the responses for the major peaks. Calculate the quantity, in mg, of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4$ in the portion of Morphine Sulfate taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of anhydrous morphine sulfate in the *Standard preparation*, as determined from the concentration of USP Morphine Sulfate RS corrected for moisture content by a titrimetric water determination; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Morphine Sulfate Extended-Release Capsules

DEFINITION

Morphine Sulfate Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Diluent: Water. Adjust with phosphoric acid to a pH of 3.6.

Buffer solution: 13.8 mg/mL of monobasic sodium phosphate

Solution A: Acetonitrile, triethylamine, *Buffer solution*, and water (25:0.5:100:874.5). Adjust with phosphoric acid to a pH of 3.6.

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
33	100	0
44	85	15
54	85	15
55	100	0
65	100	0

System suitability solution: 400 µg/mL of USP Morphine Sulfate RS, 10 µg/mL of USP Morphine Related Compound A RS, and 10 µg/mL of USP Morphine Related Compound B RS (pseudomorphine) in *Diluent*

Standard solution: 1.0 mg/mL of USP Morphine Sulfate RS in *Diluent*

Sample stock solution: Transfer a weighed portion of the contents from NLT 20 Capsules, nominally equivalent to 250 mg of morphine sulfate pentahydrate, to a 100-mL volumetric flask. Add 5 mL of methanol, and mix well for 30 min with gentle swirling every 5 min. Add *Diluent* up to half of the flask volume, and sonicate for 5 min to dissolve. Dilute with *Diluent* to volume.

Sample solution: Nominally 1.0 mg/mL of morphine sulfate pentahydrate from *Sample stock solution* in *Diluent*. Pass through a suitable filter, and use the clear filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Columns

Guard: Packing L1

Analytical: 3.9-mm × 30-cm; 10-µm packing L1

Flow rate: 2 mL/min

Injection volume: 40 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between the morphine related compound A and morphine sulfate peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ in the portion of Capsules taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Morphine Sulfate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of morphine sulfate pentahydrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

pH 7.5 phosphate buffer: 6.8 mg/mL of monobasic potassium phosphate and 1.6 mg/mL of sodium hydroxide. Adjust with phosphoric acid or 2 N sodium hydroxide to a pH of 7.5.

Medium: Proceed as directed in *Dissolution* (711), *Procedure, Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms, Method B*, observing the following exceptions. Perform *Acid Stage* testing, using 500 mL of 0.1 N hydrochloric acid for 1 h; and perform *Buffer Stage* testing, using 500 mL of pH 7.5 phosphate buffer for NLT 8 h.

Apparatus 1: 100 rpm

Times: 1, 4, 6, and 9 h

Mobile phase: Methanol, glacial acetic acid, and water (280:10:720), containing 0.73 g of sodium 1-heptanesulfonate for each 1.01 L of the solvent mixture

System suitability solution: 0.1 mg/mL each of phenol and USP Morphine Sulfate RS in *Mobile phase*

Standard solution: USP Morphine Sulfate RS in pH 7.5 phosphate buffer to obtain a solution with a known concentration corresponding to that of the *Sample solution*

Sample solution: Sample per *Dissolution* (711).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 284 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Flow rate: 2 mL/min

Injection volume: 25 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for phenol and morphine sulfate are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the phenol and morphine sulfate peaks

Tailing factor: NMT 2.0 for the morphine sulfate peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution and Sample solution*

Tolerances: See Table 2.

Table 2

Time (h)	Amount Dissolved (%)
1	NMT 10
4	25–50
6	50–90
9	NLT 85

The percentage of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ dissolved in 1 h conforms to *Dissolution* (711), *Extended-Release Dosage Forms, Acceptance Table 3*. The percentages of the labeled amount of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ dissolved at the other times specified conform to *Dissolution* (711), *Extended-Release Dosage Forms, Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium

Acid stage: 0.1 N hydrochloric acid (HCl); 500 mL

Buffer stage: pH 7.5 phosphate buffer (Dissolve 40.8 g of monobasic potassium phosphate and 9.6 g of sodium hydroxide in 6 L of water. Adjust with phosphoric acid or 2 N sodium hydroxide to a pH of 7.5.); 500 mL

Apparatus 1: 100 rpm

Times: 1, 4, 6, and 9 h

Solution A: 0.1% Phosphoric acid and 0.1% triethylamine in water

Mobile phase: *Solution A* and methanol (93:7)

Standard stock solution: 2.0 mg/mL of USP Morphine Sulfate RS in water

Standard solution: 0.16 mg/mL of USP Morphine Sulfate RS in either the *Acid stage* under *Medium* or in the *Buffer stage* under *Medium*, from *Standard stock solution*

Sample solution: Pass a portion of the solution under test through a suitable filter of 10- μ m pore size. Centrifuge the filtrate if necessary.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection volume: 5 μ L

Run time: NLT 2 times the retention time of morphine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution and Sample solution*

Replace the *Acid stage* under *Medium* immediately after 1 h with the *Buffer stage* under *Medium*.

Calculate the concentration (C_i) of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of morphine from the *Sample solution* at each time point (i)

r_S = peak response of morphine from the appropriate *Standard solution* at each time point (i)

C_S = concentration of USP Morphine Sulfate RS in the appropriate *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = C_2 \times V \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times (V - V_S)] + (C_2 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times (V - 2 \times V_S)] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ in the portion of the sample withdrawn at each time point (i) (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Capsule)

V_S = volume of *Medium* taken (mL)

Tolerances: See Table 3.

Table 3

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 10
2	4	10–35
3	6	50–70
4	9	NLT 80

The percentages of the labeled amount of morphine sulfate pentahydrate released at the times specified conform to *Dissolution* (711), *Extended-Release Dosage Forms, Acceptance Table 2*.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

- **ORGANIC IMPURITIES**

Diluent, Solution A, System suitability solution, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Sensitivity solution: 0.5 μ g/mL of USP Morphine Sulfate RS in *Diluent*

System suitability

Samples: *System suitability solution, Standard solution, and Sensitivity solution*

Suitability requirements

Resolution: NLT 2.0 between the morphine related compound A and morphine sulfate peaks, *System suitability solution*

Sensitivity: Morphine peak is detectable, *Sensitivity solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Diluent and Sample solution*. [NOTE—Disregard the peaks corresponding to those obtained in the chromatogram of the *Diluent*.]

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*
 r_S = peak response of morphine sulfate from the *Standard solution*
 F = relative response factor (see Table 4)
 Acceptance criteria: See Table 4.

Table 4

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Morphine related compound A ^a	1.4	1.0	0.5
Morphine sulfate	1.0	—	—
Morphine related compound B ^b	2.3	2.1	0.5
Any unspecified impurity	—	—	0.2
Total impurities	—	—	1.5

^a 7,8-Didehydro-4,5 α -epoxy-17-methylmorphinan-3,6 α -diol, N-oxide.

^b 2,2'-Bimorphine.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **LABELING:** When more than one test for *Dissolution* is given, the *Labeling* section states the test for *Dissolution* used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**

Morphine Sulfate Injection

DEFINITION

Morphine Sulfate Injection is a sterile solution of Morphine Sulfate in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$. Injection intended for intramuscular or intravenous administration may contain sodium chloride as a tonicity-adjusting agent, and suitable antioxidants and antimicrobial agents. Injection intended for intrathecal or epidural use may contain sodium chloride as a tonicity-adjusting agent, but contains no other added substances.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Sulfate (191):** It meets the requirements of the barium chloride test.

ASSAY

PROCEDURE

Mobile phase: Dissolve 0.73 g of sodium 1-heptanesulfonate in 720 mL of water, and add 280 mL of methanol and 10 mL of glacial acetic acid.

System suitability solution: 0.24 mg/mL of USP Morphine Sulfate RS and 0.15 mg/mL of phenol in *Mobile phase*

Standard solution: 0.24 mg/mL of USP Morphine Sulfate RS (on the anhydrous basis) in *Mobile phase*.

[NOTE—Prepare a fresh solution daily.]

Sample solution: Nominally 0.24 mg/mL of morphine sulfate from the Injection in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 284 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 25 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for phenol and morphine are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between phenol and morphine sulfate, *System suitability solution*

Tailing factor: NMT 2.0 for the morphine sulfate peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ in each mL of the Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Morphine Sulfate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

M_{r1} = molecular weight of morphine sulfate pentahydrate, 758.83

M_{r2} = molecular weight of anhydrous morphine sulfate, 668.77

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **PH (791):** 2.5–6.5
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 17.0 USP Endotoxin Units/mg of morphine sulfate. If labeled for intrathecal use, it contains NMT 14.29 USP Endotoxin Units/mg of morphine sulfate.
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements under small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light. Preserve Injection labeled "Preservative-free" in single-dose containers.
- **LABELING:** It meets the requirements for *Labeling* (7), *Labels and Labeling for Injectable Products*. Label it also to state that the Injection is not to be used if its color is darker than pale yellow, if it is discolored in any other way, or if it contains a precipitate. Injection containing no antioxidant or antimicrobial agents prominently bears on its label the words "Preservative-free" and includes in its labeling its routes of administration and the statement that it is not to be heat-sterilized. Injection containing antioxidant or antimicrobial agents includes in its labeling its routes of administration and the statement that it is not for intrathecal or epidural use.

 - USP Endotoxin RS
 - USP Morphine Sulfate RS

Morphine Sulfate Compounded Suppositories

DEFINITION

Morphine Sulfate Compounded Suppositories contain NLT 90.0% and NMT 110.0% of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$. Prepare Morphine Sulfate Compounded Suppositories in Fatty Acid Base or Polyethylene Glycol Base as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Morphine Sulfate	50 mg
Silica Gel	25 mg
Fatty Acid Base or Polyethylene Glycol Base, a sufficient quantity to make	1 suppository

Calibrate the actual molds with the *Base* that is used for preparing the Suppositories, and adjust the formula accordingly. Thoroughly mix the *Morphine Sulfate* and *Silica Gel* to obtain a uniform powder. Heat the *Base* slowly and evenly until melted. Slowly add the powder to the melted *Base* with stirring. Mix thoroughly, and pour into molds. Cool, trim, and wrap.

ASSAY

• SUPPOSITORIES IN FATTY ACID BASE

Mobile phase: Dissolve 5.5 g of sodium 1-heptanesulfonate in 700 mL of water, and add 300 mL of methanol and 10 mL of glacial acetic acid. Filter and degas.

System suitability solution: 0.24 mg/mL of USP Morphine Sulfate RS and 0.15 mg/mL of phenol in *Mobile phase*.

Standard solution: 0.5 mg/mL of USP Morphine Sulfate RS in *Mobile phase*. Prepare a fresh solution daily.

Sample solution: Transfer 1 Suppository to a 60-mL separator containing 20 mL of chloroform and 20 mL of 0.01 N hydrochloric acid, and shake to dissolve the Suppository. Transfer the chloroform layer to a 250-mL separator. Extract the aqueous layer with a second 20-mL portion of chloroform, and combine the chloroform extracts in the 250-mL separator. Wash the chloroform extracts with two additional 20-mL portions of 0.01 N hydrochloric acid, combine the aqueous layers in a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass through a filter of 0.45- μ m or finer pore size, discarding the first 4 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 284 nm

Column: 4.6-mm \times 25-cm; packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for phenol and morphine sulfate are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between phenol and morphine sulfate, *System suitability solution*

Tailing factor: NMT 2.0 for the morphine sulfate peak

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ in the Suppository:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Morphine Sulfate RS in the *Standard solution* (mg/mL) (corrected for moisture content by titrimetric determination)

C_U = nominal concentration of morphine sulfate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of morphine sulfate pentahydrate, 758.83

M_{r2} = molecular weight of anhydrous morphine sulfate, 668.77

Acceptance criteria: 90.0%–110.0%

• SUPPOSITORIES IN POLYETHYLENE GLYCOL BASE

Mobile phase, System suitability solution, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay for Suppositories in Fatty Acid Base*.

Sample solution: Transfer 1 Suppository to a 100-mL volumetric flask, and add 70 mL of *Mobile phase*. Sonicate for 15 min to dissolve the Suppository, cool, dilute with *Mobile phase* to volume, and mix. Pass a 10-mL portion of the solution through a filter of 0.45- μ m or finer pore size, discarding the first 4 mL of filtrate.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of morphine sulfate pentahydrate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$ in the Suppository:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Morphine Sulfate RS in the *Standard solution* (mg/mL) (corrected for moisture content by titrimetric determination)

C_U = nominal concentration of morphine sulfate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of morphine sulfate pentahydrate, 758.83

M_{r2} = molecular weight of anhydrous morphine sulfate, 668.77

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements for *Weight Variation*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, and store in a refrigerator. Do not dispense or store Polyethylene Glycol Base Suppositories in polystyrene containers.
- **BEYOND-USE DATE:** NMT 90 days after the date on which they were compounded when stored in a refrigerator
- **LABELING:** Label Morphine Sulfate Compounded Suppositories to state whether they are in a Fatty Acid Base or in a Polyethylene Glycol Base. Label to indicate that they are for rectal use only. Label to state that they are to be stored in a refrigerator. Label it to state the *Beyond-Use Date*.

• **USP REFERENCE STANDARDS** (11)
USP Morphine Sulfate RS

Morrhuate Sodium Injection

» Morrhuate Sodium Injection is a sterile solution of the sodium salts of the fatty acids of Cod Liver Oil. It contains, in each mL, not less than 46.5 mg and not more than 53.5 mg of morrhuate sodium. A suitable antimicrobial agent, not to exceed 0.5 percent, and ethyl alcohol or benzyl alcohol, not to exceed 3.0 percent, may be added.

NOTE—Morrhuate Sodium Injection may show a separation of solid matter on standing. Do not use the material if such solid does not dissolve completely upon warming.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass. It may be packaged in 50-mL multiple-dose containers.

USP Reference standards (11)—
USP Endotoxin RS

Identification—Evaporate about 5 mL of the chloroform solution of the fatty acids obtained in the test for *Iodine value of the fatty acids* on a steam bath nearly to dryness, dissolve the residue in 1 mL of chloroform, and add 1 drop of sulfuric acid: a transient red color is produced, and it changes to brown-red.

Bacterial Endotoxins Test (85)—It contains not more than 1.4 USP Endotoxin Units per mg of morrhuate sodium.

Acidity and alkalinity—To 5 mL of Injection add 5 mL of alcohol and 2 drops of phenolphthalein TS. If no red color is produced, not more than 0.50 mL of 0.10 N sodium hydroxide is required to impart a distinct red color. If a red color is produced, not more than 0.30 mL of 0.10 N acid is required to discharge it. For concentrations of morrhuate sodium other than 5%, no larger than proportional volumes of alkali and acid are required.

Iodine value of the fatty acids—Transfer to a tared, 125-mL conical flask the solvent hexane solution of the fatty acids obtained in the Assay. Evaporate at about 60° to dryness, dry the residue in vacuum over silica gel for 18 hours, and weigh. Dissolve the residue in chloroform to make 100.0 mL of solution, and determine the iodine value (see *Fats and Fixed Oils* (401)) on a 25.0-mL aliquot of the solution: the iodine value is not less than 130.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1), except that at times it may show a slight turbidity or precipitate.

Assay—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of morrhuate sodium, to a small separator containing 30.0 mL of 0.1 N sulfuric acid VS, add 25 mL of solvent hexane, shake gently, and allow to separate. Withdraw the aqueous layer into a beaker or flask, and wash the solvent hexane layer with two 10-mL portions of water, adding the washings to the main aqueous solution. Retain the hexane solution for the test for *Iodine value of the fatty acids*. Add methyl orange TS, and titrate the excess acid in the aqueous solution with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sulfuric acid is equivalent to 32.4 mg of morrhuate sodium.

Moxidectin

$C_{37}H_{53}NO_8$ 639.82
(6*R*,25*S*)-5-*O*-Demethyl-28-deoxy-25-[(*E*)-1,3-dimethyl-1-butenyl]-6,28-epoxy-23-oxomilbemycin B 23-(*E*)-(*O*-methyloxime); (2*aE*,4*E*,5'*R*,6*R*,6'*S*,8*E*,11*R*,13*S*,15*S*,17*aR*,20*R*,20*aR*,20*bS*)-6'-[(*E*)-1,3-Dimethyl-1-butenyl]-5',6,6',7,10,11,14,15,17*a*,20,20*a*,20*b*-dodecahydro-20,20*b*-dihydroxy-5',6,8,19-tetramethylspiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecin-13,2'-[2*H*]pyran]-4',17(3'*H*)-dione 4'-(*E*)-(O-methyloxime) [113507-06-5].

DEFINITION

Moxidectin contains NLT 92.0% and NMT 102.0% of moxidectin ($C_{37}H_{53}NO_8$), calculated on the anhydrous basis. It may contain a suitable antioxidant.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Buffer: Dissolve 7.7 g of ammonium acetate in 400 mL of water, and adjust with glacial acetic acid to a pH of 4.8.

Mobile phase: Acetonitrile and Buffer (60:40)

Standard solution: 1.0 mg/mL of USP Moxidectin RS in acetonitrile. Sonicate if necessary to facilitate dissolution.

Sample solution: 1.0 mg/mL of Moxidectin in acetonitrile. Sonicate if necessary to facilitate dissolution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 3.9-mm × 15-cm; 4-μm packing L1

Column temperature: 50°

Flow rate: 2.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 1%, for four replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of moxidectin ($C_{37}H_{53}NO_8$) in the portion of Moxidectin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Moxidectin RS in the *Standard solution* (mg/mL)

C_U = concentration of Moxidectin in the *Sample solution* (mg/mL)

Acceptance criteria: 92.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1, Jan-2018)

- **ORGANIC IMPURITIES: EARLY-ELUTING IMPURITIES**

Buffer, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

System suitability solution: 1.0 mg/mL of USP Moxidectin System Suitability Mixture RS in acetonitrile. Sonicate if necessary to facilitate dissolution.

Standard solution: 0.01 mg/mL of Moxidectin in acetonitrile from the *Sample solution*

System suitability

Sample: *System suitability solution*

Suitability requirements

Peak-to-valley ratio: NLT 3.0 between moxidectin 17a-epimer and moxidectin

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each early-eluting impurity in the portion of Moxidectin taken:

$$\text{Result} = (r_u/r_s) \times F \times D \times 100$$

r_u = peak response of each early-eluting impurity from the *Sample solution*

r_s = peak response of moxidectin from the *Standard solution*

F = Assay value expressed as a decimal

D = dilution factor used to prepare the *Standard solution*, 0.01

Acceptance criteria: See Table 1.

The reporting level for impurities is 0.1%. Disregard the peak due to the stabilizer (identify this peak, where applicable, by injecting a suitable reference solution).

IMPURITIES

• **ORGANIC IMPURITIES: EARLY-ELUTING RELATED COMPOUNDS (RELATIVE RETENTION TIME LESS THAN 1.8)**

Protect the *System suitability solution*, *Standard solution*, and *Sample solution* from light. Analyze the *Sample solution* immediately after preparation.

Solution A: Dissolve 0.5 g of tetrabutylammonium hydrogen sulfate and 1.0 g of monobasic potassium phosphate in 1000 mL of water. Add 2 mL of phosphoric acid, filter, and degas.

Solution B: Methanol

Mobile phase: See Table 1.

Blank solution: Use *Solution A*.

System suitability solution: 0.1 mg/mL of USP Moxifloxacin Hydrochloride RS and 1 µg/mL of USP Moxifloxacin Related Compound A RS in *Solution A*

Standard stock solution: 6 mg/mL of USP Moxifloxacin Hydrochloride RS in water

Standard solution: 2 µg/mL of USP Moxifloxacin Hydrochloride RS in *Solution A* from *Standard stock solution*

Sensitivity solution: 0.05 µg/mL of USP Moxifloxacin Hydrochloride RS from the *Standard solution* in *Solution A*. Store the *Sensitivity solution* under refrigeration and protected from light.

Sample solution: Nominally 0.1 mg/mL of moxifloxacin from Ophthalmic Solution in *Solution A*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 293 nm

Column: 4.0-mm × 25-cm; 5-µm packing L11

Column temperature: 45°

Flow rate: See Table 1.

Injection volume: 25 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.0 between the moxifloxacin and moxifloxacin related compound A peaks, *System suitability solution*

Column efficiency: NLT 4000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Blank solution*, *Standard solution*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*
 r_S = peak response of moxifloxacin from the *Standard solution*
 C_S = concentration of USP Moxifloxacin Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of moxifloxacin in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of moxifloxacin, 401.43
 M_{r2} = molecular weight of moxifloxacin hydrochloride, 437.89
 F = relative response factor (see Table 2)
 Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Specified unknown impurity #1	0.3	1.0	0.2
Decarboxy ^a	0.4	0.13	0.3
Specified unknown impurity #2	0.9	1.0	0.3
Moxifloxacin	1.0	—	—
Moxifloxacin related compound A ^b	1.1	—	—
8-Hydroxy ^{c,d}	1.8	—	—
Other single impurities ^e	—	1.0	0.1
Any specified and identified impurity	—	1.0	1.0

^a 1-Cyclopropyl-6-fluoro-8-methoxy-7-[(4aS,7aS)-octahydro-pyrrolo[3,4-b]pyridin-6-yl]-1H-quinolin-4-one.

^b Disregard this peak because this is a process impurity controlled for the drug substance.

^c 1-Cyclopropyl-6-fluoro-8-hydroxy-7-[(4aS,7aS)-octahydro-6H-pyrrolo[3,4-b]pyridin-6-yl]-4-oxo-1,4-dihydroquinoline-3-carboxylic acid.

^d Disregard this peak because it is quantitated using *Organic Impurities: Late-Eluting Related Compounds (Relative Retention Time Equal to More Than 1.8)*.

^e Disregard any peaks obtained from the *Blank*.

• **ORGANIC IMPURITIES: LATE-ELUTING RELATED COMPOUNDS (RELATIVE RETENTION TIME EQUAL TO MORE THAN 1.8)**

Protect the *Standard solution* and *Sample solution* from light. Analyze the *Sample solution* immediately after preparation.

Solution A: Dissolve 0.5 g of tetrabutylammonium hydrogen sulfate and 1.0 g of monobasic potassium phosphate in 1000 mL of water. Add 2 mL of phosphoric acid, filter, and degas.

Solution B: Methanol

Mobile phase: *Solution B* and *Solution A* (40:60)

Blank solution: Use *Solution A*.

Standard stock solution: 6 mg/mL of USP Moxifloxacin Hydrochloride RS in water

Standard solution: 2 µg/mL of USP Moxifloxacin Hydrochloride RS in *Solution A* from *Standard stock solution*

Sensitivity solution: 0.05 µg/mL of USP Moxifloxacin Hydrochloride RS from the *Standard solution* in *Solution A*. Store the *Sensitivity solution* under refrigeration and protected from light.

Sample solution: Nominally 0.1 mg/mL of moxifloxacin from Ophthalmic Solution in *Solution A*. The 8-hydroxy compound is unstable in dilute aqueous solutions. Analyze the *Sample solution* immediately after preparation.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 293 nm

Column: 4.0-mm × 25-cm; 5-μm packing L11

Column temperature: 45°

Flow rate: 0.9 mL/min

Injection volume: 25 μL

System suitability

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Column efficiency: NLT 2000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Blank solution*, *Standard solution*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of moxifloxacin from the *Standard solution*

C_S = concentration of USP Moxifloxacin Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of moxifloxacin in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of moxifloxacin, 401.43

M_{r2} = molecular weight of moxifloxacin hydrochloride, 437.89

F = relative response factor (see *Table 3*)

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Moxifloxacin	1.0	—	—
8-Hydroxy	1.8	0.29	0.2
Specified unknown impurity #3	3.4	1.0	0.2
Specified impurity #4 ^a	3.9	0.42	0.2
Other single impurities	—	1.0	0.1

^a 7-Amino-1-cyclopropyl-6-fluoro-8-methoxy-4-oxo-1,4-dihydro-quinoline-3-carboxylic acid.

Total impurities (sum from both *Organic Impurities* tests) is NMT 1.5%.

SPECIFIC TESTS

• **STERILITY TESTS** <71>: It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*.

• **PH** <791>: 6.3–7.3

• **OSMOLALITY AND OSMOLARITY** <785>: 260–320 mOsmol/kg

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 2° and 25°.

• **USP REFERENCE STANDARDS** (11)

Moxifloxacin Hydrochloride

$C_{21}H_{24}FN_3O_4 \cdot HCl$ 437.89

(4a*S*-*cis*)-1-Cyclopropyl-6-fluoro-1,4-dihydro-8-methoxy-7-(octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl)-4-oxo-3-quinolinecarboxylic acid, monohydrochloride;

1-Cyclopropyl-6-fluoro-1,4-dihydro-8-methoxy-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-*b*]pyridin-6-yl]-4-oxo-3-quinolinecarboxylic acid, monohydrochloride [186826-86-8].

DEFINITION

Moxifloxacin Hydrochloride contains NLT 98.0% and NMT 102.0% of moxifloxacin hydrochloride ($C_{21}H_{24}FN_3O_4 \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** <197K>

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

• **C. IDENTIFICATION TESTS—GENERAL** <191>, *Chloride*

Sample solution: To a solution (1 in 160) add diluted nitric acid, and filter.

Acceptance criteria: Meets the requirements

ASSAY

Change to read:

PROCEDURE

Buffer: Dissolve 0.5 g of tetrabutylammonium hydrogen sulfate and 1.0 g of monobasic potassium phosphate in water, add 2 mL of phosphoric acid, dilute with water to 1000 mL, mix, and pass through a filter of 0.45-μm pore size.

Mobile phase: Methanol and *Buffer* (28:72)

Diluent: Add 20 mg of anhydrous sodium sulfite to 1000 mL of *Buffer*, mix gently, and pass through a filter of 0.45-μm pore size.

System suitability solution: 0.1 mg/mL of USP Moxifloxacin Hydrochloride RS and 1 μg/mL of USP Moxifloxacin Related Compound A RS, in *Diluent*

Standard solution: 0.1 mg/mL of USP Moxifloxacin Hydrochloride RS in *Diluent*

Sample solution: 0.1 mg/mL of Moxifloxacin Hydrochloride in *Diluent*

C₂₁H₂₄FN₃O₄ · HCl 437.89▲USP40

Mupirocin

C₂₆H₄₄O₉ 500.62

Nonanoic acid, 9-[[[3-methyl-1-oxo-4-[[tetrahydro-3,4-dihydroxy-5-[[3-(2-hydroxy-1-methylpropyl)oxiran-yl]methyl]-2*H*-pyran-2-yl]-2-butenyl]oxy]-, [2*S*-2α(*E*), 3β,4β, 5α[2*R**, 3*R**(1*R**, [2*R**)]]]-

(*E*)-(2*S*,3*R*,4*R*,5*S*)-5-[[[2*S*,3*S*,4*S*,5*S*)-2,3-Epoxy-5-hydroxy-4-methylhexyl]tetrahydro-3,4-dihydroxy-β-methyl-2*H*-pyran-2-crotonic acid, ester with 9-hydroxynonanoic acid [12650-69-0].

» Mupirocin contains not less than 920 µg and not more than 1020 µg of mupirocin (C₂₆H₄₄O₉) per mg, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Mupirocin RS

USP Mupirocin Lithium RS

Identification—The IR absorption spectrum of a mineral oil dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Mupirocin RS.

Crystallinity (695): meets the requirements.

pH (791): between 3.5 and 4.5, in a saturated aqueous solution.

Water Determination, Method I (921): not more than 1.0%.

Assay—

pH 6.3 phosphate buffer—Prepare 0.05 M monobasic sodium phosphate, and adjust with 10 N sodium hydroxide to a pH of 6.3 ± 0.2.

Mobile phase—Prepare a suitable mixture of pH 6.3 phosphate buffer and acetonitrile (750:250), pass through a suitable filter of 0.5 µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 11 mg of USP Mupirocin Lithium RS, accurately weighed, to a 100-mL volumetric flask, add 25 mL of acetonitrile, and swirl to dissolve. Dilute with pH 6.3 phosphate buffer to volume, and mix.

Resolution solution—Adjust 10 mL of *Standard preparation* with 6 N hydrochloric acid to a pH of 2.0, allow to stand for 2 hours, and adjust with 5 N sodium hydroxide to a pH of 6.3 ± 0.2.

Assay preparation—Transfer about 11 mg of Mupirocin, accurately weighed, to a 100-mL volumetric flask, add

25 mL of acetonitrile, and swirl to dissolve. Dilute with pH 6.3 phosphate buffer to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 229-nm detector and a 4.6-mm × 25-cm column that contains packing L1 based on spherical silica particles. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for the mupirocin acid hydrolysis product and 1.0 for mupirocin, and the resolution, R , between the mupirocin acid hydrolysis product and mupirocin is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2, the column efficiency is not less than 1500 theoretical plates when calculated by the formula:

$$5.545(t_r / W_{h/2})^2$$

in which the terms are as defined therein. The relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μ g, of mupirocin ($C_{26}H_{44}O_9$) in each mg of Mupirocin taken by the formula:

$$(M_s E / M_u)(r_u / r_s)$$

in which M_s is the weight, in mg, of USP Mupirocin Lithium RS taken to prepare the *Standard preparation*; E is the mupirocin equivalent, in μ g per mg, of USP Mupirocin Lithium RS; M_u is the weight, in mg, of mupirocin taken to prepare the *Assay preparation*; and r_u and r_s are the mupirocin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mupirocin Calcium

$C_{52}H_{86}CaO_{18} \cdot 2H_2O$ 1075.34

Nonanoic acid, 9-[[[3-methyl-1-oxo-4-[tetrahydro-3,4-dihydroxy-5-[[[3-(2-hydroxy-1-methylpropyl)oxiranyl]methyl]-2H-pyran-2-yl]-2-butenyl]oxy-, calcium salt (2:1), dihydrate, [2S-[2 α (E), 3 β , 4 β , 5 α [2R*, 3R*(1R*, 2R*)]]]-; (α E, 2S, 3R, 4R, 5S)-5-[(2S, 3S, 4S, 5S)-2,3-Epoxy-5-hydroxy-4-methylhexyl]tetrahydro-3,4-dihydroxy- β -methyl-2H-pyran-2-crotonic acid, ester with 9-hydroxynonanoic acid, calcium salt (2:1), dihydrate [115074-43-6].

DEFINITION

Mupirocin Calcium contains the equivalent of NLT 865 μ g/mg and NMT 936 μ g/mg of mupirocin ($C_{26}H_{44}O_9$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
Sample: Do not grind extensively.
Acceptance criteria: Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL** (191), *Calcium*: Meets the requirements

ASSAY

• PROCEDURE

Solution A: 7.7 g/L of ammonium acetate in water, adjusted with glacial acetic acid to a pH of 5.7 before diluting to the final volume

Mobile phase: Tetrahydrofuran and *Solution A* (32:68)

Standard solution: 125 μ g/mL of USP Mupirocin Lithium RS prepared as follows. Transfer a suitable amount of USP Mupirocin Lithium RS to a suitable volumetric flask, dissolve in methanol, using 2.5% of the final volume, and dilute with *Solution A* to volume.

System suitability solution: Adjust 10 mL of the *Standard solution* with 6 N hydrochloric acid to a pH of 2.0, and allow to stand for 20 h.

Sample solution: Transfer 25 mg of Mupirocin Calcium to a 200-mL volumetric flask, dissolve in 5 mL of methanol, and dilute with *Solution A* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L7

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 7.0 between the second of the two peaks corresponding to mupirocin rearrangement products and the peak corresponding to mupirocin, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in μ g/mg, of mupirocin ($C_{26}H_{44}O_9$) in the portion of Mupirocin Calcium taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times P$$

r_u = peak area of mupirocin from the *Sample solution*

r_s = peak area of mupirocin from the *Standard solution*

C_s = concentration of USP Mupirocin Lithium RS in the *Standard solution* (mg/mL)

C_u = concentration of Mupirocin Calcium in the *Sample solution* (mg/mL)

P = potency of mupirocin in USP Mupirocin Lithium RS (μ g/mg)

Acceptance criteria: 865–936 μ g/mg

IMPURITIES

• CHLORIDE AND SULFATE (221), *Chloride*

Analysis: Dissolve 50 mg in a mixture of 1 mL of 2 N nitric acid and 15 mL of methanol. Add 1 mL of silver nitrate TS.

Acceptance criteria: The turbidity does not exceed that produced by 0.70 mL of 0.020 N hydrochloric acid (0.5%).

• ORGANIC IMPURITIES

Solution A: Prepare as directed in the *Assay*.

Solution B: 13.6 g/L of sodium acetate in water, adjusted with glacial acetic acid to a pH of 4.0 before diluting to the final volume

Mobile phase: Tetrahydrofuran and *Solution A* (30:70)

Diluent: Methanol and *Solution B* (1:1)

Standard solution: 125 μ g/mL of USP Mupirocin Lithium RS in *Diluent*

System suitability solution: Adjust 10 mL of the *Standard solution* with 6 N hydrochloric acid to a pH of 2.0, allow to stand for 20 h, and adjust with 5 N sodium hydroxide to a pH of 4.0.

Sample solution: 5 mg/mL of Mupirocin Calcium in Diluent

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for two mupirocin rearrangement products and mupirocin in the *System suitability solution* are 0.63, 0.67, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 7.0 between the mupirocin rearrangement product, with a relative retention time of about 0.67, and mupirocin, *System suitability solution*

Column efficiency: NLT 3000 theoretical plates for the mupirocin peak, *Standard solution*

Tailing factor: NMT 2 for the mupirocin peak, *Standard solution*

Relative standard deviation: NMT 5% for the mupirocin peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each related compound in the portion of Mupirocin Calcium taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

r_u = peak area of any impurity from the *Sample solution*

r_s = peak area of mupirocin from the *Standard solution*

C_s = concentration of USP Mupirocin Lithium RS in the *Standard solution* (mg/mL)

C_u = concentration of Mupirocin Calcium in the *Sample solution* (mg/mL)

P = potency of mupirocin in USP Mupirocin Lithium RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Acceptance criteria: See Table 1. Disregard any peak with an area less than 0.05 times the area of the mupirocin peak in the *Standard solution*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Pseudomonic acid D ^a	0.75	2.5
Mupirocin	1.0	—
Any other unspecified impurity	—	1
Total impurities	—	4.5

^a (E)-9-[(E)-4-[(2S,3R,4R,5S)-3,4-Dihydroxy-5-[(2S,3S)-3-[(2S,3S)-3-hydroxybutan-2-yl]oxiran-2-yl)methyl]tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyloxy]non-4-enoic acid.

SPECIFIC TESTS

• **OPTICAL ROTATION** (781S), *Specific Rotation*

Sample solution: 50 mg/mL in methanol

Acceptance criteria: −16° to −20°

• **WATER DETERMINATION** (921), *Method I*: 3.0%–4.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

• **USP REFERENCE STANDARDS** (11)

USP Mupirocin Calcium RS

USP Mupirocin Lithium RS

Mupirocin Cream

» Mupirocin Cream contains a quantity of Mupirocin Calcium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of mupirocin (C₂₆H₄₄O₉). It may contain one or more suitable buffers, dispersants, and preservatives.

Packaging and storage—Preserve in collapsible tubes or well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

Labeling—Label it to indicate that it contains Mupirocin Calcium and its equivalent content of mupirocin.

USP Reference standards (11)—

USP Mupirocin Lithium RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Minimum fill (755): meets the requirements.

pH (791): between 6.0 and 8.0.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic microbial count does not exceed 100 cfu per g.

Related compounds—

0.1 M Ammonium acetate, *Solution A*, *Solution B*, *Mobile phase*, and pH 6.3 Phosphate buffer—Proceed as directed in the *Assay*.

Sodium acetate solution—Add 5.8 mL of glacial acetic acid to 900 mL of water, adjust with sodium hydroxide TS to a pH of 4.0, dilute with water to 1000 mL, and mix.

Tetrahydrofuran solution—Mix 750 mL of tetrahydrofuran and 250 mL of water.

Sodium acetate and tetrahydrofuran solution—Prepare a mixture of *Sodium acetate solution* and *Tetrahydrofuran solution* (50:50).

System suitability solution—Use the *Standard preparation*, prepared as directed in the *Assay*.

Test stock solution—Transfer an accurately weighed quantity of Cream, equivalent to about 50 mg of mupirocin, to a screw-capped centrifuge tube. Add 5.0 mL of *Tetrahydrofuran solution*, cap, and disperse the Cream by mixing on a vortex mixer and shaking. Add 5.0 mL of *Sodium acetate solution*, cap, and mix. Centrifuge for about 15 minutes. Withdraw the lower layer from the tube, pass it through a filter having a 0.5-μm or finer porosity, and use the filtrate.

Test solution—Transfer 1.0 mL of the *Test stock solution* to a 50-mL volumetric flask, dilute with *Sodium acetate and tetrahydrofuran solution* to volume, mix, and pass through a filter having a 0.5-μm or finer porosity.

Chromatographic system (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *Test stock solution*, and record the responses as directed for *Procedure*. Identify the peaks based on the relative retention times for mupirocin and related substances shown in Table 1: the resolution, R , between pseudomonic acid D and mupirocin is not less than 3. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the column efficiency for the mupirocin peak

is not less than 7000 theoretical plates; the tailing factor for the mupirocin peak is not more than 1.75; and the relative standard deviation of the mupirocin peak for replicate injections is not more than 2%.

Procedure—[NOTE—Ensure that buffers, dispersants, or preservatives in the formulation do not interfere with quantification of either impurities or degradation products.] Separately inject equal volumes (about 20 µL) of the *Test stock solution* and the *Test solution* into the chromatograph, and measure the peak responses for all of the peaks that do not correspond to buffers, dispersants, or preservatives. Calculate the percentage of each related compound and degradation product relative to mupirocin in the portion of Cream taken by the formula:

$$(r_i / r_M)(100 / 50)$$

in which r_i is the peak response for each related compound or degradation product obtained from the *Test stock solution*; r_M is the peak response of the mupirocin peak obtained from the *Test solution*; and 50 is the dilution factor for the *Test solution*.

Table 1

⁴ (E)-9-[(E)-4-[(2S,3R,4R,5S)-3,4-Dihydroxy-5-[(2S,3S)-3-[(2S,3S)-3-hydroxybutan-2-yl]oxiran-2-yl)methyl]tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyloxy]non-4-enoic acid.

⁵ 9-[(E)-3-Methyl-4-[(2S,3R,4S,5R)-3,4,5-trihydroxy-5-[(2S,3S)-3-[(2S,3S)-3-hydroxybutan-2-yl]oxiran-2-yl)methyl]tetrahydro-2H-pyran-2-yl]but-2-enoyloxy]nonanoic acid.

⁶ 9-[(E)-4-[(2S,3R,4R,5S)-3,4-Dihydroxy-5-[(3-hydroxy-4,5-dimethyltetrahydrofuran-2-yl)methyl]tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyloxy]nonanoic acid.

⁷ 9-[(E)-4-[(2S,3R,4R,5S)-3,4-Dihydroxy-5-[(4R,5S,E)-5-hydroxy-4-methylhex-2-enyl]tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyloxy]nonanoic acid.

⁸ 11-[(E)-4-[(2S,3R,4R,5S)-3,4-Dihydroxy-5-[(2S,3S)-3-[(2S,3S)-3-hydroxybutan-2-yl]oxiran-2-yl)methyl]tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyloxy]undecanoic acid.

Assay—

0.1 M Ammonium acetate—Dissolve about 7.7 g of ammonium acetate in about 900 mL of water in a 1000-mL volumetric flask, adjust with glacial acetic acid to a pH of 5.7, and dilute with water to volume.

Solution A—Prepare a filtered and degassed mixture of 0.1 M Ammonium acetate and tetrahydrofuran (75:25).

Solution B—Prepare a filtered and degassed mixture of 0.1 M Ammonium acetate and tetrahydrofuran (70:30):

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

pH 6.3 Phosphate buffer—Dissolve 69 g of monobasic sodium phosphate in 800 mL of water, adjust with sodium hydroxide TS to a pH of 6.3, dilute with water to 1000 mL, and mix.

Standard preparation—Dissolve an accurately weighed portion of USP Mupirocin Lithium RS in pH 6.3 Phosphate buffer. Dilute an accurately measured volume of this solution quantitatively with the same solvent to obtain a solution having a known concentration of about 0.1 mg of mupirocin per mL.

Assay preparation—Transfer an accurately weighed quantity of Cream, equivalent to about 10 mg of mupirocin, to a 100-mL volumetric flask. Add 50 mL of pH 6.3 Phosphate buffer and 25 mL of tetrahydrofuran. Insert the stopper into the flask, mix on a vortex mixer, and shake for 1 to 3 minutes. Dilute with pH 6.3 Phosphate buffer to volume. Allow to stand until the oil layer separates out, then dilute the aqueous layer with pH 6.3 Phosphate buffer to volume. Repeat 2 to 3 times until as much of the oil layer has separated out as possible. After the final dilution, pass the final solution (bottom layer) through a filter having a 0.5-µm or finer porosity. This solution will have a nominal concentration of 0.1 mg per mL of mupirocin based on label claim.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. Maintain the column at a constant temperature up to 35°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–6	100	0	isocratic
6–35	100→0	0→100	linear gradient
35–55	0	100	isocratic
55–55.01	0→100	100→0	immediate
55.01–65	100	0	isocratic

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*. [NOTE—Pseudomonic acid D is a minor component that is always present in mupirocin calcium.] Identify the peaks by their retention times which are about 0.75 for pseudomonic acid D and 1.0 for mupirocin: the resolution, R , between pseudomonic acid D and mupirocin is not less than 3; the column efficiency for the mupirocin peak is not less than 7000 theoretical plates; the tailing factor for the mupirocin peak is not more than 1.75; and the relative standard deviation of the mupirocin peak for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses for the major peaks. Calculate the percent label claim of mupirocin in the portion of Cream taken by the formula:

$$(P / 1000)(C_S / C_U)(r_U / r_S)(100)$$

in which $P / 1000$ is the potency of mupirocin, converted from µg per mg to mg per mg, in USP Mupirocin Lithium RS; C_S is the concentration, in mg per mL, of USP Mupirocin Lithium RS in the *Standard preparation*; C_U is the nominal concentration, in mg per mL, of Cream in the *Assay preparation*; and r_U and r_S are the mupirocin peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mupirocin Ointment

» Mupirocin Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mupirocin ($C_{26}H_{44}O_9$).

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.

USP Reference standards (11)—

USP Mupirocin Lithium RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for mupirocin, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Minimum fill (755): meets the requirements.

Assay—

pH 6.3 phosphate buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the *Assay* under Mupirocin.

Assay preparation—Dissolve an accurately weighed quantity of Ointment, equivalent to about 10 mg of mupirocin, in 25 mL of acetonitrile. Transfer this solution, with the aid of *pH 6.3 phosphate buffer*, to a 100-mL volumetric flask, dilute with *pH 6.3 phosphate buffer* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under Mupirocin. Calculate the quantity, in mg, of mupirocin ($C_{26}H_{44}O_9$) in the portion of Ointment taken by the formula:

$$(M_s E / 1000)(r_u / r_s)$$

in which the terms are as defined therein.

Mupirocin Nasal Ointment

» Mupirocin Nasal Ointment contains a quantity of Mupirocin Calcium equivalent to not less than 90.0 percent and not more than 105.0 percent of the labeled amount of mupirocin ($C_{26}H_{44}O_9$).

Packaging and storage—Preserve in collapsible tubes or in well-closed containers, and store at controlled room temperature.

USP Reference standards (11)—

USP Mupirocin Lithium RS

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeasts count does not exceed 10 cfu per g. It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

Minimum fill (755): meets the requirements.

Uniformity of dosage units (905): meets the requirements.

Related compounds—

Ammonium acetate buffer, Mobile phase, Sodium acetate buffer, Diluent A, Diluent B, and Chromatographic system—Prepare as directed in the *Assay*.

Test solution—Transfer an accurately weighed portion of Mupirocin Nasal Ointment, equivalent to about 50 mg of mupirocin, to a suitable stoppered conical flask, add 5 mL of *Diluent A*, and shake vigorously on a mechanical shaker at full speed for 1 hour to disperse the ointment. Add 5 mL of *Sodium acetate buffer*, and shake vigorously on a mechanical shaker at full speed for 15 minutes. Pass through a filter having a porosity of 0.45 μ m.

Diluted test solution—Dilute a portion of the *Test solution* quantitatively, and stepwise if necessary, with *Diluent B* to obtain a solution having a nominal concentration of about 0.1 mg of mupirocin per mL, based on the label claim.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Test solution* and the *Diluted test solution* into the chromatograph, and measure the peak area responses for all the peaks. Identify the peaks by the relative retention times shown in Table 1.

Table 1

⁶9-((E)-4-((2S,3R,4R,5S)-3,4-Dihydroxy-5-((3-hydroxy-4,5-dimethyltetrahydrofuran-2-yl)methyl)tetrahydro-2H-pyran-2-yl)-3-methylbut-2-enoyloxy)nonanoic acid.

⁷9-((E)-4-((2S,3R,4R,5S)-5-((4S,5S)-2-Chloro-3,5-dihydroxy-4-methylhexyl)-3,4-dihydroxytetrahydro-2H-pyran-2-yl)-3-methylbut-2-enoyloxy)nonanoic acid.

⁸9-((E)-4-((2S,3R,4R,5S)-3,4-Dihydroxy-5-((4R,5S,E)-5-hydroxy-4-methylhex-2-enyl)tetrahydro-2H-pyran-2-yl)-3-methylbut-2-enoyloxy)nonanoic acid.

Calculate the percentage of each related compound in the portion of Mupirocin Nasal Ointment taken by the formula:

$$(100 \times r_i) / (D \times r_s)$$

in which r_i is the peak response of any impurity in the *Test solution*; D is the dilution factor used to convert the *Test solution* to the *Diluted test solution*; and r_s is the peak response for the mupirocin peak in the *Diluted test solution*. The specified and unspecified impurities meet the limits listed in Table 1.

Assay—

Ammonium acetate buffer—Dissolve about 7.7 g of ammonium acetate in water, and dilute with water to 1000 mL.

Mix, and adjust with acetic acid to a pH of 5.7. Filter this solution prior to preparation of the *Mobile phase*.

Mobile phase—Prepare a mixture of *Ammonium acetate buffer* and tetrahydrofuran (75 : 25). Make adjustments if necessary (see *System suitability* under *Chromatography* (621)). The *Mobile phase* is extremely sensitive to changes in tetrahydrofuran concentration. Degas the *Mobile phase* by helium sparging or ultrasonication before use.

Sodium acetate buffer—Dissolve about 13.6 g of sodium acetate in water, and dilute with water to 1000 mL. Mix, and adjust with acetic acid to a pH of 4.0.

Diluent A: a mixture of tetrahydrofuran and water (75:25).

Diluent B: a mixture of *Diluent A* and *Sodium acetate buffer* (1:1).

Standard preparation—Prepare a solution of USP Mupirocin Lithium RS in *Diluent B*, containing about 0.1 mg per mL of mupirocin.

Assay preparation—Transfer an accurately weighed portion of Mupirocin Nasal Ointment, equivalent to about 10 mg of mupirocin, to a 100-mL volumetric flask, add 50.0 mL of *Diluent A*, and shake vigorously on a mechanical shaker at full speed for 1 hour to disperse the ointment. Dilute with *Sodium acetate buffer* to volume, and shake vigorously on a mechanical shaker at full speed for 15 minutes. Prior to use, pass through a filter having a porosity of 0.45 μ m.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm \times 25-cm column that contains 7- μ m packing L7. The flow rate is about 1.5 mL per minute. [NOTE—The flow rate may be adjusted if needed to obtain a retention time of about 13 minutes for the mupirocin peak.] Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the peaks for pseudomonic acid D and mupirocin is not less than 3.5; the column efficiency for the mupirocin peak is not less than 3000 theoretical plates; the tailing factor for the mupirocin peak is not more than 2.0; and the relative standard deviation of the mupirocin peak for five replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the responses for the major peaks. Calculate the percentage of the label claim of mupirocin in the portion of Mupirocin Nasal Ointment taken by the formula:

$$(P / 1000)(C_s / C_u)(r_u / r_s)(100)$$

in which (*P* / 1000) is the potency, converted from μ g per mg to mg per mg, of mupirocin in USP Mupirocin Lithium RS; *C*_s is the concentration, in mg per mL, of mupirocin in the *Standard preparation*; *C*_u is the nominal concentration, in mg per mL, of mupirocin in the *Assay preparation*; and *r*_u and *r*_s are the peak responses for the mupirocin peak in the *Assay preparation* and the *Standard preparation*, respectively.

Mycophenolate Mofetil

C₂₃H₃₁NO₇

433.49

4-Hexenoic acid, 6-(1,3-dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-, 2-(4-morpholinyl)ethyl ester, (E)-;
2-Morpholinoethyl (E)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-5-phthalanyl)-4-methyl-4-hexenoate [128794-94-5].

DEFINITION

Mycophenolate Mofetil contains NLT 98.0% and NMT 102.0% of mycophenolate mofetil (C₂₃H₃₁NO₇), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: Triethylamine and water (1:325). Adjust with phosphoric acid to a pH of 5.3.

Mobile phase: Acetonitrile and *Buffer* (7:13)

Standard solution: 0.4 mg/mL of USP Mycophenolate Mofetil RS in acetonitrile

Sample solution: 0.4 mg/mL of Mycophenolate Mofetil in acetonitrile

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mycophenolate mofetil (C₂₃H₃₁NO₇) in the portion of Mycophenolate Mofetil taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times 100$$

*r*_u = peak response from the *Sample solution*

*r*_s = peak response from the *Standard solution*

*C*_s = concentration of USP Mycophenolate Mofetil RS in the *Standard solution* (mg/mL)

*C*_u = concentration of Mycophenolate Mofetil in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm (Official 1: Jan-2018)

ORGANIC IMPURITIES

Buffer and Mobile phase: Prepare as directed in the *Assay*.

• LIMIT OF Z-MYCOPHENOLATE MOFETIL

[NOTE—Z-Mycophenolate mofetil is 2-morpholinoethyl (Z)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-5-phthalanyl)-4-methyl-4-hexenoate.]

Triethylamine solution: Prepare as directed in the Assay.

Mobile phase: Acetonitrile and Triethylamine solution (7:13)

Sensitivity solution: 1.25 µg/mL of USP Mycophenolate Mofetil RS in acetonitrile

Standard solution: 0.025 mg/mL of USP Mycophenolate Mofetil RS in acetonitrile

Sample solution: Open Capsules, equivalent to 1.25 g of mycophenolate mofetil based on the label claim, and transfer the contents including Capsule shells into a 500-mL volumetric flask. Add 50 mL of water and shake mechanically for a minimum of 15 min. Add 350 mL of acetonitrile, sonicate for 15 min, and shake mechanically for 20 min. Dilute with acetonitrile to volume. Pass through a nylon filter of 0.45-µm pore size and discard the first 2 mL of the filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing L7

Column temperature: 60°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Run time: 1.7 times the retention time of the mycophenolate mofetil peak

System suitability

Samples: Sensitivity solution and Standard solution

[NOTE—The relative retention times for mycophenolate mofetil and Z-mycophenolate mofetil are 1.0 and 1.1, respectively.]

Suitability requirements

Tailing factor: NMT 2.0, Standard solution

Relative standard deviation: NMT 5.0%, Standard solution

Signal-to-noise ratio: NLT 10, Sensitivity solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of Z-mycophenolate mofetil in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of Z-mycophenolate mofetil from the Sample solution

r_S = peak response of mycophenolate mofetil from the Standard solution

C_S = concentration of USP Mycophenolate Mofetil RS in the Standard solution (mg/mL)

C_U = nominal concentration of mycophenolate mofetil in the Sample solution (mg/mL)

Acceptance criteria: NMT 0.10%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.
- **LABELING:** When more than one Dissolution test is given, the labeling states the test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
USP Mycophenolate Mofetil RS

Mycophenolate Mofetil for Injection

DEFINITION

Mycophenolate Mofetil for Injection contains an amount of Mycophenolate Mofetil Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$).

IDENTIFICATION

- The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY

• PROCEDURE

[NOTE—Protect solutions from light.]

Buffer 1: Transfer 10 mL of triethylamine into a 1000-mL volumetric flask containing about 950 mL of water and mix. Adjust with phosphoric acid to a pH of 7.2, and dilute with water to volume.

Buffer 2: Transfer 10 mL of triethylamine into a 1000-mL volumetric flask containing about 950 mL of water and mix. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to volume.

Solution A: Buffer 1 and water (4:9)

Diluent: Acetonitrile, Buffer 2, and water (7:4:9)

Mobile phase: Acetonitrile and Solution A (3:7)

Standard stock solution: Transfer a known quantity of USP Mycophenolate Mofetil RS in a suitable volumetric flask, add acetonitrile equivalent to about 10% of the final volume, and sonicate for about 5 min or until the solid dissolves. Dilute with Diluent to volume to obtain a solution containing a known concentration of 1.0 mg/mL of USP Mycophenolate Mofetil RS.

Standard solution: 0.4 mg/mL of USP Mycophenolate Mofetil RS in Diluent, from Standard stock solution

Sample solution: Constitute each of the containers of Mycophenolate Mofetil for Injection with 14 mL of 5% Dextrose Injection. Quantitatively transfer the contents of all vials, the combined contents of which are equivalent to about 2 g of mycophenolate mofetil, to a 200-mL volumetric flask, and dilute with water to volume. Transfer 4.0 mL of this solution to a 100-mL volumetric flask, and dilute with Diluent to volume.

Mycophenolate Mofetil for Oral Suspension

DEFINITIONMycophenolate Mofetil for Oral Suspension is a dry mixture of mycophenolate mofetil and one or more suitable buffers, colors, diluents, and flavors. It contains NLT 90.0% and NMT 110.0% of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$).

IDENTIFICATION

- The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

[NOTE—Protect solutions from light.]

Buffer 1: Pipet 10 mL of triethylamine into a 1000-mL volumetric flask containing about 950 mL of water, and mix. Adjust with phosphoric acid to a pH of 7.2, and dilute with water to volume.

Buffer 2: Pipet 10 mL of triethylamine into a 1000-mL volumetric flask containing about 950 mL of water, and mix. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to volume.

Solution A: *Buffer 1* and water (4:9)

Extraction solvent: Acetonitrile, *Buffer 2*, and water (13:4:9)

Diluent: Acetonitrile, *Buffer 2*, and water (7:4:9)

Mobile phase: Acetonitrile and *Solution A* (3:7)

Standard stock solution: 4 mg/mL of USP Mycophenolate Mofetil RS in *Extraction solvent*. Sonicate to aid the dissolution.

Standard solution: 0.4 mg/mL of USP Mycophenolate Mofetil RS in *Diluent*, from the *Standard stock solution*

Sample stock solution: Constitute Mycophenolate Mofetil for Oral Suspension as directed on the label.

Prepare a composite sample by mixing NLT 4 bottles of the constituted Mycophenolate Mofetil for Oral Suspension. Transfer a volume of the composite sample so obtained, equivalent to 800 mg of mycophenolate mofetil, to a 200-mL volumetric flask, and dilute with *Extraction solvent* to volume.

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume. Pass through a filter of 45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 249 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L11

Column temperature: 45°

Autosampler temperature: 5°

Flow rate: 1.5 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{23}H_{31}NO_7$ in the portion of Mycophenolate Mofetil for Oral Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of mycophenolate mofetil in the *Standard solution* (mg/mL)

C_u = nominal concentration of mycophenolate mofetil in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

[NOTE—Prepare all solutions in low-actinic glassware.]

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated

Apparatus 2: 40 rpm

Time: 20 min

Standard solution: 0.278 mg/mL of USP Mycophenolate Mofetil RS in *Medium*

Sample solution: Reconstitute Mycophenolate Mofetil for Oral Suspension according to the labeling instructions. Shake well. Use a separate 3-mL syringe for each vessel. Withdraw 2 mL of suspension. Remove air bubbles from the syringe. Adjust the volume to 1.2 mL and accurately weigh the filled syringe. Operate the apparatus, holding the syringe above the surface of the medium, at a location that is halfway between the paddle shaft and the vessel wall. Carefully introduce the sample to the vessel over a 5–10 s period. Weigh the empty syringe and determine the weight of the sample (g). At the time specified, withdraw an aliquot and immediately pass through a suitable filter of 10- μ m pore size, discarding the first few mL.

Spectrometric conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 304 nm

Cell: 0.2 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of mycophenolate mofetil dissolved:

$$\text{Result} = (A_u/A_s) \times (C_s/L) \times (V_1/V_2) \times 100$$

A_u = absorbance of the *Sample solution*

A_s = absorbance of the *Standard solution*

C_s = concentration of mycophenolate mofetil in the *Standard solution* (mg/mL)

L = suspension label claim of mycophenolate mofetil (mg/mL)

V_1 = volume of *Medium*, 900 (mL)

V_2 = volume of sample (mL), weight (g) of the sample divided by the density of the suspension (g/mL)

Tolerances: NLT 80% (Q) of the labeled amount of mycophenolate mofetil is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

- **DELIVERABLE VOLUME** (698): Meets the requirements

IMPURITIES**Organic Impurities**

[NOTE—Protect solutions from light.]

Mycophenolate Mofetil Tablets

DEFINITION

Mycophenolate Mofetil Tablets contain NLT 94.0% and NMT 105.0% of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$).

IDENTIFICATION

- A. ULTRAVIOLET ABSORPTION (197U)**

Standard solution and Sample solution: Use the *Standard solution* and *Sample solution* as prepared in the test for *Dissolution*.

Acceptance criteria: The UV absorption spectrum of the *Standard solution* and the *Sample solution* exhibit maxima and minima at the same wavelength within ± 3 nm.

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- PROCEDURE**

Phosphoric acid solution: Phosphoric acid and water (3:50)

Triethylamine solution: Transfer 3 mL of triethylamine to 1000 mL of water. Adjust with *Phosphoric acid solution* to a pH of 5.3.

Mobile phase: Acetonitrile and *Triethylamine solution* (11:9)

Standard solution: 0.125 mg/mL of USP Mycophenolate Mofetil RS in acetonitrile

Sample solution: Nominally equivalent to 0.125 mg/mL of mycophenolate mofetil prepared as follows. Place Tablets, equivalent to 2.5 g of mycophenolate mofetil based on the label claim, into a 1000-mL volumetric flask. Add 100 mL of water, and shake mechanically for a minimum of 15 min. Add 700 mL of acetonitrile, sonicate for 15 min, and shake mechanically for 20 min. Dilute with acetonitrile to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with acetonitrile to volume. Pass through a nylon filter of 0.45- μ m pore size, and discard the first 5 mL of filtrate.

Chromatographic system

Analysis
Samples: *Standard solution* and *Sample solution*
 Calculate the concentration (C_i) of mycophenolate mofetil ($C_{23}H_{31}NO_7$) dissolved at each time point (i):

$$\text{Result} = (A_U/A_S) \times C_S$$

A_U = absorbance from the *Sample solution*
 A_S = absorbance from the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_1 \times V_3)\} \times (1/L) \times 100$$

C_i = concentration of mycophenolate mofetil in the portion of sample withdrawn at the specified time (mg/mL)
 V = volume of the *Medium*, 900 mL
 L = label claim (mg/Tablet)
 V_3 = volume of the *Sample solution* withdrawn at each time point (mL)
Tolerances: See *Table 1*.

Table 1

Time Point (i)	Time (min)	Tolerances (Q)
1	5	NLT 75%
2	15	NLT 85%

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated
Apparatus 2: 50 rpm
Times: 5 and 15 min
Diluted phosphoric acid: Transfer 5 mL of phosphoric acid to a 25-mL volumetric flask. Dilute with water to volume.
Buffer: 3.0 mL/L of triethylamine in water. Adjust with *Diluted phosphoric acid* to a pH of 5.3.
Mobile phase: Acetonitrile and *Buffer* (45:55)
Diluent: Acetonitrile and *Buffer* (20:80)
Standard stock solution: 0.56 mg/mL of USP Mycophenolate Mofetil RS in *Medium*
Standard solution: 0.11 mg/mL of USP Mycophenolate Mofetil RS in *Diluent*, prepared from the *Standard stock solution*
Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size. Transfer 5 mL of the filtrate to a 25-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of mycophenolate mofetil ($C_{23}H_{31}NO_7$) dissolved at each time point (i):

$$\text{Result} = (r_U/r_S) \times C_S \times D$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

D = dilution factor of the *Sample solution*, 5

Calculate the percentage of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_1 \times V_3)\} \times (1/L) \times 100$$

C_i = concentration of mycophenolate mofetil in the portion of sample withdrawn at the specified time (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 2*.

Table 2

Time Point (i)	Time (min)	Tolerances (Q)
1	5	NLT 60%
2	15	NLT 80%

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Times: 5 and 15 min

Standard solution: 0.011 mg/mL of USP Mycophenolate Mofetil RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size. Dilute 2 mL of the filtrate with *Medium* to 100 mL.

Detector: UV 250 nm

Path length: 1 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of mycophenolate mofetil ($C_{23}H_{31}NO_7$) dissolved at each time point (i):

$$\text{Result} = (r_U/r_S) \times C_S \times D$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

D = dilution factor of the *Sample solution*, 50

Calculate the percentage of the labeled amount of mycophenolate mofetil ($C_{23}H_{31}NO_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_s)] + (C_i \times V_s)\} \times (1/L) \times 100$$

C_i = concentration of mycophenolate mofetil in the portion of sample withdrawn at the specified time (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See Table 3.

Table 3

Time Point (i)	Time (min)	Tolerances (Q)
1	5	NLT 70%

Mobile phase, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Sensitivity solution: 0.0625 µg/mL of USP Mycophenolate Mofetil RS in acetonitrile

System suitability

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Tailing factor: NMT 2, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis
[NOTE—The run time for the *Sample solution* is 3 times that of the retention time of the mycophenolate mofetil peak.]

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of each individual impurity from the *Sample solution*

r_s = peak response of mycophenolate mofetil from the *Standard solution*

C_s = concentration of USP Mycophenolate Mofetil RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of mycophenolate mofetil in the *Sample solution* (mg/mL)

F = relative response factor for each individual impurity (see Table 4)

Acceptance criteria: See Table 4. [NOTE—Disregard peaks at relative retention times of 1.45 and 2.15. Disregard any peaks less than 0.05%.]

Table 4

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Mycophenolic acid ^a	0.6	1.4	1.0
Mycophenolate N-oxide analog ^b	0.8	1.0	0.2
Mycophenolate mofetil	1.0	—	—
Any single unspecified impurity	—	1.0	0.1
Total degradation products	—	—	1.5

^a (E)-6-(1,3-Dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoic acid.

^b 2-Morpholinoethyl (E)-6-(1,3-dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoate N-oxide.

• LIMIT OF Z-MYCOPHENOLATE MOFETIL

[NOTE—Z-Mycophenolate mofetil is 2-morpholinoethyl (Z)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-5-phthalanyl)-4-methyl-4-hexenoate.]

Triethylamine solution: Proceed as directed in the *Assay*.

Mobile phase: Acetonitrile and *Triethylamine solution* (7:13)

Sensitivity solution: 1.25 µg/mL of USP Mycophenolate Mofetil RS in acetonitrile

Standard solution: 0.025 mg/mL of USP Mycophenolate Mofetil RS in acetonitrile

Sample solution: Place Tablets, equivalent to 2.5 g of mycophenolate mofetil based on the label claim, into a 1000-mL volumetric flask. Add 100 mL of water, and shake mechanically for a minimum of 15 min. Add 700 mL of acetonitrile, sonicate for 15 min, and shake mechanically for 20 min. Dilute with acetonitrile to volume. Pass through a nylon filter of 0.45-µm pore size, and discard the first 2 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing L7

Column temperature: 60°

Flow rate: 1.5 mL/min

Run time: 1.7 times the retention time of the mycophenolate mofetil peak

Injection volume: 10 µL

System suitability

Samples: *Sensitivity solution* and *Standard solution*

[NOTE—The relative retention times for mycophenolate mofetil and Z-mycophenolate mofetil are 1.0 and 1.1, respectively.]

Suitability requirements

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of Z-mycophenolate mofetil in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of Z-mycophenolate mofetil from the *Sample solution*

r_s = peak response of mycophenolate mofetil from the *Standard solution*

C_s = concentration of USP Mycophenolate Mofetil RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of mycophenolate mofetil in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.10%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
USP Mycophenolate Mofetil RS

Mycophenolate Sodium

$C_{17}H_{19}NaO_6$ 342.32
4-Hexenoic acid, 6-(1,3-dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuran-4-yl)-4-methyl-, monosodium salt, (E)-;
Sodium (E)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-1,3-dihydroisobenzofuran-5-yl)-4-methylhex-4-enoate [37415-62-6].

DEFINITION

Mycophenolate Sodium contains NLT 98.0% and NMT 102.0% of mycophenolate sodium ($C_{17}H_{19}NaO_6$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197)**
[NOTE—Methods described in *Spectrophotometric Identification Tests, Infrared Absorption* (197K), (197M), or (197A) may be used.]
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

SPECIFIC TESTS

• SODIUM CONTENT

Standard stock solution: Use commercially available sodium atomic absorption spectroscopy standard solution of 1000 µg/mL of sodium in 0.5 M nitric acid.

Diluent: Transfer 3 mL of nitric acid to a 250-mL volumetric flask, and dilute with water to volume.

Standard solution A: 6.0 µg/mL of sodium in *Diluent* from *Standard stock solution*

Standard solution B: 9.0 µg/mL of sodium in *Diluent* from *Standard stock solution*

Standard solution C: 12.0 µg/mL of sodium in *Diluent* from *Standard stock solution*

Sample solution: 0.14 mg/mL of Mycophenolate Sodium prepared as follows. Weigh 30–40 mg of Mycophenolate Sodium into a digestion vessel, add 3 mL of nitric acid and digest at 150° for 5 h. Allow to cool, transfer the digestion solution to a 250-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 589.0 nm

Lamp: Sodium hollow-cathode

Flame: Air–acetylene

Blank: *Diluent*

System suitability

Sample: *Standard solution B*

Suitability requirements

Relative standard deviation: NMT 5% for absorbance from three readings

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*
Plot the absorbances of the *Blank* and *Standard solutions* versus their concentrations of sodium (0, 6.0, 9.0, and 12.0 µg/mL), and draw a calibration curve best fitting the four points. From the graph so obtained, determine the concentration, in µg/mL, of sodium in the *Sample solution*.

Calculate the percentage of sodium in the portion of Mycophenolate Sodium taken:

$$\text{Result} = F \times (C_S/C_U) \times 100$$

F = conversion factor (0.001 mg/µg)

C_S = concentration of sodium in the *Sample solution* (µg/mL)

C_U = concentration of Mycophenolate Sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 5.7%–7.7% on the anhydrous basis

- **X-RAY DIFFRACTION** (941): Its X-ray diffraction pattern conforms to that of USP Mycophenolate Sodium RS, similarly determined.

- **WATER DETERMINATION**, *Method 1a* (921): NMT 1.5%
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial limit does not exceed 10^3 cfu/g. The total yeasts and molds count does not exceed 10^2 cfu/g.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Protect from light.
- **USP REFERENCE STANDARDS** (11)
USP Mycophenolate Mofetil Related Compound B RS (RS)-7-Hydroxy-5-methoxy-4-methyl-6-[2-(5-methyl-2-oxo-tetrahydrofuran-5-yl)ethyl]-3H-isobenzofuranyl-1-one.
 $C_{17}H_{20}O_6$ 320.34
USP Mycophenolate Sodium RS

Mycophenolic Acid Delayed-Release Tablets

DEFINITION

Mycophenolic Acid Delayed-Release Tablets contain an amount of mycophenolate sodium equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of mycophenolic acid ($C_{17}H_{20}O_6$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Protect solutions from light.

Solution A: Dissolve 21 g of citric acid in a suitable volume of water, add 200 mL of 1 M sodium hydroxide solution, and dilute with water to 1 L.

Buffer: *Solution A* and 0.1 M hydrochloric acid (399:601)

Solution B: Acetonitrile, *Buffer*, and water (40:15:45)

Solution C: Acetonitrile and *Buffer* (85:15)

Mobile phase: See Table 1. Return to original conditions, and re-equilibrate the system.

Table 1

Time (min)	Solution B (%)	Solution C (%)
0	100	0
9	100	0
18	0	100
22	0	100

Diluent: *Solution B*

Standard solution: 0.385 mg/mL of USP Mycophenolate Sodium RS in *Diluent*. Stir magnetically for at least 60 min to aid dissolution.

Sample stock solution: Nominally equivalent to 9 mg/mL of mycophenolic acid in *Diluent* prepared as follows. Transfer NLT 25 Tablets to a volumetric flask and add *Diluent* to volume. Add a stirring bar and stir vigorously for at least 60 min. Centrifuge a portion of the suspension and use the clear supernatant.

Sample solution: Nominally equivalent to 0.36 mg/mL of mycophenolic acid in *Diluent* from *Sample stock solution*

Myrrh

DEFINITION

Myrrh is the oleo-gum resin of stems and branches of *Commiphora molmol* Engler and other related species of *Commiphora* other than *Commiphora mukul* (Fam. Burseraceae).

miphora other than *Commiphora mukul* (Fam. Burseraceae).

IDENTIFICATION

A. PROCEDURE

Analysis: Triturate 0.4 g of crushed Myrrh with 1 g of washed sand, shake for a few min with 10 mL of ethyl ether, and filter. Evaporate the filtrate to dryness in a porcelain dish, and add a few drops of nitric acid to the residue.

Acceptance criteria: A purplish violet color is produced instantly.

B. PROCEDURE

Analysis: Transfer 0.1 g of powdered Myrrh to a test tube, and add 1 mL of nitric acid.

Acceptance criteria: A red color is produced. Upon addition of a crystal of vanillin, the red color deepens and does not diminish when water is added.

C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 7 µg/mL of (E)-anethole, 8 µg/mL of linalool, and 10 µg/mL each of (–)-bornyl acetate and (R)-(-)-carvone in toluene

Sample solution: 250 mg/mL of finely powdered Myrrh in alcohol. [NOTE—Shake for 1 min, centrifuge, and filter.]

Spray reagent: Dissolve 0.5 mL of *p*-anisaldehyde in 10 mL of glacial acetic acid. Add 85 mL of methanol, and then carefully add 5 mL of sulfuric acid. [NOTE—Prepare fresh immediately before use.]

Application volume: 2 µL for the *Sample solution* and 1 µL for the *Standard solution*

Developing solvent system: Toluene and ethyl acetate (93:7)

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Wash the plate in the *Developing solvent system*, and air-dry before use.]

Spray the plate with *Spray reagent*, heat in an oven at 100° for 5 min, and examine in white light.

Acceptance criteria

The chromatogram of the *Standard solution* exhibits four well-resolved spots: an olive-brown spot due to (E)-anethole at an *R_f* value of about 0.6; an orange-brown spot due to (–)-bornyl acetate at an *R_f* value of about 0.5; a reddish brown spot due to (R)-(-)-carvone at an *R_f* value of about 0.4; and a deep gray spot due to linalool at an *R_f* value of about 0.2.

The chromatogram of the *Sample solution* exhibits an intense purplish red spot at an *R_f* value of about 0.7 and two moderately intense purplish red spots at *R_f* values of about 0.5 and 0.4. The chromatogram of the *Sample solution* may exhibit other spots of varying intensities, including a spot at the origin.

D. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 4 µg/mL of (E)-anethole and 1 mg/mL of thymol in alcohol

Sample solution: Transfer 0.5 g of finely powdered Myrrh to a test tube containing 5.0 mL of alcohol, and warm the mixture in a water bath for 2–3 min. Cool, and filter.

Developing solvent system: Toluene and ethyl acetate (49:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed. Allow the plate to air-dry, and examine under UV light at 365 nm.

Acceptance criteria: The chromatogram of the *Sample solution* shows no blue-to-violet fluorescent zones in the lower third of the chromatogram (absence of *Commiphora mukul*).

IMPURITIES

- **ARTICLES OF BOTANICAL ORIGIN, Limits of Elemental Impurities (561):** Meets the requirements
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 5.0%
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 10.0%
- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 2%

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS:** Myrrh occurs in rounded or irregular tears, or bumps of agglutinated tears, of variable sizes; brownish yellow to reddish brown, covered with some grayish or yellowish dust, externally; rich brown or reddish brown internally, sometimes marked with white spots or lines; thin splinters, translucent or almost transparent; brittle; waxy, granular, conchoidal fracture; characteristic and aromatic odor; aromatic, bitter, and acid taste.
- **LOSS ON DRYING (731):** Dry 1.0 g of powdered Myrrh between 100° and 105° for 2 h; it loses NMT 15.0% of its weight
- **ARTICLES OF BOTANICAL ORIGIN, Alcohol-Soluble Extractives, Method 2 (561):** 40%–70%
- **ARTICLES OF BOTANICAL ORIGIN, Water-Soluble Extractives, Method 2 (561):** NLT 50%
- **ARTICLES OF BOTANICAL ORIGIN, Volatile Oil Determination (561):** NLT 6.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature, in a dry place.
- **LABELING:** Label it to indicate the species of *Commiphora* from which the oleo-gum resin was obtained. Label it to indicate that it is intended for topical and oropharyngeal use only.

Myrrh Topical Solution

» Prepare Myrrh Topical Solution as follows:

Myrrh	200 g
A mixture of Alcohol and Water (85:15)	900 mL
Alcohol, a sufficient quantity, to make	1000 mL

Macerate about 200 g of coarsely ground Myrrh with an alcohol-water mixture for 48 hours at room temperature in a suitable vessel, which is fitted with a lid and a mechanical stirrer, agitating the mixture with the stirrer. Allow the resulting mixture to stand overnight. Decant the mixture, filter, dilute the filtrate with Alcohol to 1000 mL, and mix.

Labeling—Label it to indicate that it is intended for topical and oropharyngeal use only.

Identification—Using Topical Solution as the *Test solution*, proceed as directed for *Identification* tests C and D under *Myrrh*.

Alcohol Determination, Method II (611): between 90.0% and 110.0% of the labeled amount of C_2H_5OH .

Other requirements—It meets the requirements for *Packaging and Storage* and *Labeling* for *Tinctures* under *Botanical Extracts (565)*.

Nabumetone

$C_{15}H_{16}O_2$ 228.29
 2-Butanone, 4-(6-methoxy-2-naphthalenyl)-;
 4-(6-Methoxy-2-naphthyl)-2-butanone [42924-53-8].

DEFINITION

Nabumetone contains NLT 98.0% and NMT 101.0% of nabumetone ($C_{15}H_{16}O_2$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: Water and glacial acetic acid (999:1), filtered and degassed
Solution B: Acetonitrile and tetrahydrofuran (700:300), filtered and degassed
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
12	60	40
28	20	80
29	60	40
30	60	40

Standard solution: 1.0 mg/mL of USP Nabumetone RS in acetonitrile

Sample solution: 1.0 mg/mL of Nabumetone in acetonitrile

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 4-μm packing L1

Flow rate: 1.3 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nabumetone ($C_{15}H_{16}O_2$) in the portion of Nabumetone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Nabumetone RS in the *Standard solution* (mg/mL)

C_U = concentration of Nabumetone in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 0.001% (Official 1-Jan-2018)

ORGANIC IMPURITIES

Solution A, Solution B, Mobile phase, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability solution: 1 mg/mL of USP

Nabumetone RS and 1 μg/mL of USP Nabumetone Related Compound A RS in acetonitrile

Sample solution: Use the *Sample solution* from the *Assay*.

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times are about 0.9 for nabumetone related compound A and 1.0 for nabumetone; see *Table 2*.]

Suitability requirements

Resolution: NLT 1.5 between nabumetone related compound A and nabumetone

Column efficiency: NLT 3600 theoretical plates

Tailing factor: 0.8–2.0 for the nabumetone peak

Relative standard deviation: NMT 2.0%

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Nabumetone taken:

$$\text{Result} = (F \times r_U) / (r_N + [\Sigma(F \times r_U)]) \times 100$$

F = relative response factor for each impurity (see *Table 2*)

r_U = peak area of each impurity from the *Sample solution*

r_N = peak area of nabumetone from the *Sample solution*

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (w/w, %)

C₁₅H₁₄O₂ 226.27**Nabumetone Tablets****DEFINITION**Nabumetone Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of nabumetone (C₁₅H₁₆O₂).**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: Prepare a solution of 6 mL of glacial acetic acid in 350 mL of water. Adjust with 1 N sodium hydroxide to a pH of 3.7, and dilute with water to 400 mL.

Mobile phase: Acetonitrile and *Solution A* (300:200). Filter, and degas.

Diluent: Methanol and water (900:100)

Standard solution: 0.5 mg/mL of USP Nabumetone RS in *Diluent*

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, nominally equivalent to 500 mg of nabumetone, to a 1000-mL volumetric flask. Add 100 mL of water, and stir with the aid of a magnetic stirrer for 5 min. Dilute with methanol to volume, stir for another 15 min, and filter.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 8-mm × 10-cm; 10-μm packing L1

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitabilitySample: *Standard solution***Suitability requirements**

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of nabumetone (C₁₅H₁₆O₂) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Nabumetone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of nabumetone in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: Sodium lauryl sulfate solution (2 in 100); 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: A known concentration of USP Nabumetone RS in *Medium*

Sample solution: Filter portions of the solution under test, and suitably dilute with *Medium* if necessary.

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the amount of nabumetone (C₁₅H₁₆O₂) dissolved from the differences between the UV absorbances at the wavelengths of maximum and minimum absorbances at about 270 and 296 nm, respectively.

Tolerances: NLT 75% (Q) of the labeled amount of nabumetone (C₁₅H₁₆O₂) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 60° for 3 h.
Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Nadolol RS

Nadolol Tablets

DEFINITION

Nadolol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of nadolol (C₁₇H₂₇NO₄).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 5 mg/mL of USP Nadolol RS in 0.1 N hydrochloric acid

Sample solution: Nominally 5 mg/mL of nadolol from powdered Tablets in 0.1 N hydrochloric acid. Stir for 30 min, using a magnetic stirrer, and place in an ultrasonic bath for an additional 30 min. Centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 100 µL

Developing solvent system: Acetone, chloroform, and 2 N ammonium hydroxide (80:10:10)

Analysis

Samples: Standard solution and Sample solution

Apply the Samples as streaks. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, allow the solvent to evaporate, and examine the chromatogram under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the Sample solution corresponds to that of the Standard solution.

ASSAY

• PROCEDURE

Mobile phase: A mixture of 700 mL of methanol and 1300 mL of water containing 5.84 g of sodium chloride and 1.0 mL of 0.1 N hydrochloric acid

Standard solution: 0.2 mg/mL of USP Nadolol RS in Mobile phase

Sample solution: Equivalent to 0.2 mg/mL of nadolol from NLT 20 finely powdered Tablets in Mobile phase, prepared as follows. To a suitable amount of the powder in a suitable volumetric flask, add Mobile phase to fill 75% of the total volume. Place the flask in an ultrasonic bath for 15 min, shaking intermittently, and clarify the solution by filtration or centrifugation. Dilute with Mobile phase to volume.

Chromatographic system

(See Chromatography (621), System Suitability.)

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L16

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 3

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of nadolol (C₁₇H₂₇NO₄) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nadolol from the Sample solution

r_S = peak response of nadolol from the Standard solution

C_S = concentration of USP Nadolol RS in the Standard solution (mg/mL)

C_U = nominal concentration of nadolol in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 50 min

Solution A: Dissolve 5.84 g of sodium chloride in 1440 mL of water.

Mobile phase: Methanol and Solution A (560:1440).

Adjust with 0.1 N hydrochloric acid to a pH of 2.5.

Standard solution: USP Nadolol RS in Medium

Sample solution: Use filtered portions of the solution under test. Dilute with Medium, as necessary.

Chromatographic system and System suitability: Proceed as directed in the Assay.

Analysis

Determine the percentage of the labeled amount of nadolol (C₁₇H₂₇NO₄) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times 100$$

r_U = peak response of nadolol from the Sample solution

r_S = peak response of nadolol from the Standard solution

C_S = concentration of USP Nadolol RS in the Standard solution (mg/mL)

L = label claim (mg/tablet)

V = volume of Medium, 900 mL

D = dilution factor used in preparation of the Sample solution

Acceptance criteria: NLT 80% (Q) of the labeled amount of nadolol ($C_{17}H_{27}NO_4$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Nadolol RS

Nadolol and Bendroflumethiazide Tablets

DEFINITION

Nadolol and Bendroflumethiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of nadolol ($C_{17}H_{27}NO_4$) and bendroflumethiazide ($C_{15}H_{14}F_3N_3O_4S_2$).

IDENTIFICATION

- **A.** The retention times of the two major peaks of the *Sample solution* correspond to the corresponding peaks of the *Standard solution*, obtained as directed in the Assay.

ASSAY

PROCEDURE

Use low-actinic glassware for the *Sample solution* and the *Standard solution*.

Mobile phase: Transfer 5.62 g of sodium chloride and 1.97 g of anhydrous sodium acetate to 1000 mL of water in a 2-L volumetric flask. Add 4.0 mL of glacial acetic acid and 800 mL of methanol. Dilute with water to volume.

System suitability solution: 0.4 mg/mL each of USP Nadolol RS and USP 2,4-Disulfamyl-5-trifluoromethylaniline RS in methanol

Standard solution: 0.4 mg/mL of USP Nadolol RS and 0.4 mg/mL of USP Bendroflumethiazide RS in methanol, where *J* is the ratio of the labeled amount of bendroflumethiazide, in mg, to the labeled amount of nadolol, in mg/Tablet.

Sample solution: Nominally equivalent to 0.4 mg/mL of nadolol in methanol prepared as follows. Weigh and finely powder. Transfer a portion of the powder from NLT 20 Tablets, equivalent to 40 mg of nadolol, to a 100-mL volumetric flask. Add methanol, and sonicate for 15 min with occasional shaking. Dilute with methanol to volume, and centrifuge.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 30-cm; packing L11

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for nadolol and bendroflumethiazide are about 0.3 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.4 between the solvent and 2,4-disulfamyl-5-trifluoromethylaniline peaks, NLT 1.4 between the 2,4-disulfamyl-5-trifluoromethylaniline and nadolol peaks, and NLT 1.7 between the nadolol and bendroflumethiazide peaks; *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nadolol ($C_{17}H_{27}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nadolol from the *Sample solution*

r_S = peak response of nadolol from the *Standard solution*

C_S = concentration of USP Nadolol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of nadolol in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of bendroflumethiazide ($C_{15}H_{14}F_3N_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of bendroflumethiazide from the *Sample solution*

r_S = peak response of bendroflumethiazide from the *Standard solution*

C_S = concentration of USP Bendroflumethiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of bendroflumethiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION, Procedure for a Pooled Sample (711)**

Protect solutions from light throughout this test.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: Dissolve the USP Nadolol RS and USP Bendroflumethiazide RS in the minimal amount of methanol, and dilute with *Medium* to the desired concentrations.

Sample solutions: Sample per *Dissolution (711)*.

Using the filtered portion of the solution under test, dilute with *Medium* to a concentration that is similar to the *Standard solution*.

Chromatographic system, System suitability, and Analysis: Proceed as directed in the Assay.

Tolerances: NLT 80% (Q) of the labeled amounts of nadolol ($C_{17}H_{27}NO_4$) and bendroflumethiazide ($C_{15}H_{14}F_3N_3O_4S_2$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Content Uniformity*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS (11)**

USP Bendroflumethiazide RS

USP 2,4-Disulfamyl-5-trifluoromethylaniline RS

$C_{15}H_{14}F_3N_3O_4S_2$ 319.29

USP Nadolol RS

Nafcillin Injection

» Nafcillin Injection is a sterile isoosmotic solution of Nafcillin Sodium and one or more buffer substances in Water for Injection. It contains dextrose as a tonicity-adjusting agent. It contains an amount of nafcillin sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of nafcillin

($C_{21}H_{22}N_2O_5S$). It contains no antimicrobial preservatives.

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging*. Maintain in the frozen state.

Labeling—It meets the requirements for *Labeling* (7), *Labels and Labeling for Injectable Products*. The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

USP Reference standards (11)—

USP Endotoxin RS

USP Nafcillin Sodium RS

Identification—The retention time of the major peak for nafcillin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.13 USP Endotoxin Unit per mg of nafcillin.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

pH (791): between 6.0 and 8.5.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Assay—

Acetic acid solution, 0.05 M Sodium acetate, Diluent, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the *Assay under Nafcillin Sodium*.

Assay preparation—Allow one container of Injection to thaw, and mix. Transfer an accurately measured volume of Injection, equivalent to about 40 mg of nafcillin, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay under Nafcillin Sodium*. Calculate the quantity, in mg, of nafcillin ($C_{21}H_{22}N_2O_5S$) in each mL of the Injection taken by the formula:

$$0.1(C/V)(r_U/r_S)$$

in which *C* is the concentration, in μg per mL, of nafcillin in the *Standard preparation*; *V* is the volume, in mL, of Injection taken to prepare the *Assay preparation*; and r_U and r_S are the nafcillin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nafcillin for Injection

» Nafcillin for Injection contains an amount of Nafcillin Sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of nafcillin ($C_{21}H_{22}N_2O_5S$).

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

USP Reference standards (11)—

USP Endotoxin RS

USP Nafcillin Sodium RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

Identification—The retention time of the major peak for nafcillin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.13 USP Endotoxin Unit per mg of nafcillin.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

pH (791): between 6.0 and 8.5, in the solution constituted as directed in the labeling.

Water Determination, Method I (921): between 3.5% and 5.3%.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements for *Uniformity of Dosage Units* (905) and *Labeling* (7), *Labels and Labeling for Injectable Products*.

Assay—

Acetic acid solution, 0.05 M Sodium acetate, Diluent, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the *Assay under Nafcillin Sodium*.

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Nafcillin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Diluent* to obtain a solution having a concentration of about 0.4 mg of nafcillin ($C_{21}H_{22}N_2O_5S$) per mL.

Assay preparation 2 (where the label states the quantity of nafcillin in a given volume of constituted solution)—Constitute Nafcillin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Diluent* to obtain a solution having a concentration of about 0.4 mg of nafcillin ($C_{21}H_{22}N_2O_5S$) per mL.

Procedure—Proceed as directed for *Procedure* in the *Assay under Nafcillin Sodium*. Calculate the quantity, in mg, of nafcillin ($C_{21}H_{22}N_2O_5S$) in the portion of constituted Nafcillin for Injection taken by the formula:

$$(C/1000)(L/D)(r_U/r_S)$$

in which *L* is the labeled quantity, in mg, of nafcillin in the portion of Nafcillin for Injection taken; *D* is the concentration, in mg per mL, of nafcillin in *Assay preparation 1* or *Assay preparation 2*, as appropriate, based on the volume of constituted Nafcillin for Injection taken and the extent of dilution; and the other terms are as defined therein.

Perform the above procedure on 10 containers where it is represented as being in a single-dose container and, if necessary, on 10 containers where the label states the quantity of nafcillin in a given volume of constituted solution. Use the individual results to determine the *Uniformity of dosage units* and the average thereof as the *Assay value*.

Nafcillin Sodium

$C_{21}H_{21}N_2NaO_5S \cdot H_2O$ 454.47

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[[(2-ethoxy-1-naphthalenyl)carbonyl]amino]-3,3-dimethyl-7-oxo-, monosodium salt, monohydrate, [2S-(2 α ,5 α ,6 β)].

Monosodium (2S,5R,6R)-6-(2-ethoxy-1-naphthamido)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [7177-50-6].

Anhydrous 436.47 [985-16-0].

» Nafcillin Sodium has a potency equivalent to not less than 820 μ g of nafcillin ($C_{21}H_{22}N_2O_5S$) per mg.

Packaging and storage—Preserve in tight containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards (11)—

USP Nafcillin Sodium RS

USP Endotoxin RS

Identification—

A: Ultraviolet Absorption (197U)—

Solution: 50 μ g per mL.

Medium: water.

B: The retention time of the major peak for nafcillin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

C: It responds to the tests for *Sodium* (191).

Crystallinity (695): meets the requirements.

pH (791): between 5.0 and 7.0, in a solution containing 30 mg per mL.

Water Determination, Method I (921): between 3.5% and 5.3%.

Other requirements—Where the label states that Nafcillin Sodium is sterile, it meets the requirements for *Sterility Tests* (71) and for *Bacterial endotoxins under Nafcillin for Injection*. Where the label states that Nafcillin Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins under Nafcillin for Injection*.

Assay—

Acetic acid solution—Prepare a 1 in 20 solution of glacial acetic acid and water.

0.05 M Sodium acetate—Dissolve 6.8 g of sodium acetate in about 800 mL of water, adjust with *Acetic acid solution* to a pH of 7.5, dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.05 M *Sodium acetate* and acetonitrile (70:30). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

Diluent—Dissolve 6.9 g of sodium citrate in about 800 mL of water, adjust with 1 N hydrochloric acid to a pH of 7.0, dilute with water to 1000 mL, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Nafcillin Sodium RS quantitatively in *Diluent*

to obtain a solution having a known concentration of about 400 μ g of nafcillin ($C_{21}H_{22}N_2O_5S$) per mL.

Resolution solution—Prepare a solution of orcinol in water containing about 35 mg per mL. Add 0.5 mL of this solution to 25 mL of *Standard preparation* to obtain a solution containing about 0.7 mg of orcinol and 400 μ g of nafcillin per mL.

Assay preparation—Transfer about 88 mg of Nafcillin Sodium, accurately weighed, to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column containing packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for orcinol and 1.0 for nafcillin; and the resolution between the orcinol and nafcillin peaks is not less than 2.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μ g, of nafcillin ($C_{21}H_{22}N_2O_5S$) in each mg of Nafcillin Sodium taken by the formula:

$$200(C/W)(r_U/r_S)$$

in which C is the concentration, in μ g per mL, of nafcillin ($C_{21}H_{22}N_2O_5S$) in the *Standard preparation*; W is the weight, in mg, of the portion of Nafcillin Sodium taken; and r_U and r_S are the nafcillin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nafcillin Sodium Capsules

» Nafcillin Sodium Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of nafcillin ($C_{21}H_{22}N_2O_5S$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Nafcillin Sodium RS

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of nafcillin ($C_{21}H_{22}N_2O_5S$) by a suitable validated spectrophotometric analysis of a filtered portion of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Nafcillin Sodium RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{21}H_{22}N_2O_5S$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method I (921): not more than 5.0%.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using not less than 5 Capsules blended for 4 ± 1

minutes in a high-speed glass blender jar containing an accurately measured volume of **Buffer B.1** (CN 1-May-2017). Dilute an accurately measured volume of this stock solution quantitatively with **Buffer B.1** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Nafcillin Sodium for Oral Solution

» Nafcillin Sodium for Oral Solution contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of nafcillin ($C_{21}H_{22}N_2O_5S$). It contains one or more suitable buffers, colors, diluents, dispersants, flavors, and preservatives.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Nafcillin Sodium RS

Uniformity of dosage units (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 5.5 and 7.5, in the solution constituted as directed in the labeling.

Water Determination, Method I (921): not more than 5.0%.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using Nafcillin Sodium for Oral Solution constituted as directed in the labeling. Nafcillin Sodium Tablets

» Nafcillin Sodium Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of nafcillin ($C_{21}H_{22}N_2O_5S$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nafcillin Sodium RS

Dissolution (711)—

pH 4.0 buffer—Transfer 10.94 g of anhydrous dibasic sodium phosphate and 12.92 g of citric acid monohydrate to a 1-liter volumetric flask, dissolve in water, dilute with water to volume, and mix.

Medium: pH 4.0 buffer; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of nafcillin ($C_{21}H_{22}N_2O_5S$) dissolved from UV absorbances, at the wavelength of maximum absorbance at about 280 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution

having a known concentration of USP Nafcillin Sodium RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of nafcillin ($C_{21}H_{22}N_2O_5S$) is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method I (921): not more than 5.0%.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using not less than 5 Tablets blended for 4 ± 1 minutes in a high-speed glass blender jar containing an accurately measured volume of **Buffer B.1** (CN 1-May-2017). Naftifine Hydrochloride

$C_{21}H_{21}N \cdot HCl$ 323.86

1-Naphthalenemethanamine, N-methyl-N-(3-phenyl-2-propenyl)-, hydrochloride, (E)-;
(E)-N-Cinnamyl-N-methyl-1-naphthalenemethylamine hydrochloride [65473-14-5].

DEFINITION

Naftifine Hydrochloride contains NLT 99.0% and NMT 101.0% of naftifine hydrochloride ($C_{21}H_{21}N \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: *n*-Hexane, absolute alcohol, dimethylformamide, and formic acid (200:60:40:2). Cover tightly with a moisture-proof film, and allow to stand for 12 h at room temperature.

Standard solution: 0.2 mg/mL of USP Naftifine Hydrochloride RS in *Mobile phase*

Sample solution: 0.2 mg/mL of Naftifine Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L3

Flow rate: 2 mL/min

Injection volume: 15 μ L

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of naftifine hydrochloride ($C_{21}H_{21}N \cdot HCl$) in the portion of Naftifine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

- r_s = peak response from the *Standard solution*
 C_s = concentration of USP Naftifine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = concentration of the *Sample solution* (mg/mL)
 Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): 10 ppm • (Official 1-Jan-2018)

ORGANIC IMPURITIES

Mobile phase, *Standard solution*, *Sample solution*, and *Chromatographic system*: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Naftifine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- r_U = peak response for each impurity
 r_T = sum of all the peak responses

Acceptance criteria

Individual impurity: NMT 0.1%

Total impurities: NMT 1.0%

SPECIFIC TESTS

- **LOSS ON DRYING** (731)

Analysis: Dry over phosphorus pentoxide at 105° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Naftifine Hydrochloride RS

Naftifine Hydrochloride Cream**DEFINITION**

Naftifine Hydrochloride Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of naftifine hydrochloride ($C_{21}H_{21}N \cdot HCl$) in a water-miscible base.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**PROCEDURE**

Mobile phase: *n*-Hexane, alcohol, dimethylformamide, and formic acid (200:60:40:2). Cover tightly with a moisture-proof film, and allow to stand for 12 h at room temperature.

Standard solution: 0.2 mg/mL of USP Naftifine Hydrochloride RS in *Mobile phase*

Sample solution: Transfer 1000 mg of Cream to a 100-mL volumetric flask. Dissolve in 60 mL of methanol, mix vigorously for 2 min, and dilute with methanol to volume. Heat at 45° for 5 min, and cool to room temperature.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; 5-μm packing L3

Flow rate: 2 mL/min

Injection volume: 15 μL

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naftifine hydrochloride ($C_{21}H_{21}N \cdot HCl$) in the portion of Cream taken:

$$\text{Result} = (r_U/r_s) \times (C_s/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_s = peak response from the *Standard solution*
 C_s = concentration of USP Naftifine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of naftifine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **MINIMUM FILL** (755): Meets the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED ORGANISMS** (62): It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
- **pH** (791): 4.0–6.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Naftifine Hydrochloride RS

Naftifine Hydrochloride Gel**DEFINITION**

Naftifine Hydrochloride Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of naftifine hydrochloride ($C_{21}H_{21}N \cdot HCl$) in a water-miscible base.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**PROCEDURE**

Mobile phase: *n*-Hexane, alcohol, dimethylformamide, and formic acid (200:60:40:2). Cover tightly with a moisture-proof film, and allow to stand for 12 h at room temperature.

Standard solution: 0.2 mg/mL of USP Naftifine Hydrochloride RS in *Mobile phase*

Sample solution: Transfer 1000 mg of Gel to a 100-mL volumetric flask. Dissolve in 60 mL of methanol, mix vigorously for 2 min, and dilute with methanol to volume. Heat at 45° for 5 min, and cool to room temperature.

Nalidixic Acid

C₁₂H₁₂N₂O₃ 232.24
 1,8-Naphthyridine-3-carboxylic acid, 1-ethyl-1,4-dihydro-7-methyl-4-oxo-;
 1-Ethyl-1,4-dihydro-7-methyl-4-oxo-1,8-naphthyridine-3-carboxylic acid [389-08-2].

DEFINITIONNalidixic Acid contains NLT 99.0% and NMT 101.0% of nalidixic acid (C₁₂H₁₂N₂O₃), calculated on the dried basis.**IDENTIFICATION**

- **A. INFRARED ABSORPTION** ⟨197K⟩
- **B. ULTRAVIOLET ABSORPTION** ⟨197U⟩
Analytical wavelength: 258 nm
Sample solution: 5 μg/mL in 0.01 N sodium hydroxide
Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

ASSAY

- **PROCEDURE**

Sample solution: Dissolve 250 mg of Nalidixic Acid in 30 mL of dimethylformamide previously neutralized with thymolphthalein TS.**Titrimetric system**

Mode: Direct titration

Titrant: 0.1 N lithium methoxide VS in methanol

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* with *Titrant*, using a magnetic stirrer and taking precautions against absorption of atmospheric carbon dioxide. Each mL of 0.1 N lithium methoxide is equivalent to 23.22 mg of nalidixic acid (C₁₂H₁₂N₂O₃).

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

Standard stock solution: 1.0 mg/mL of USP Nalidixic Acid RS in chloroform*Standard solutions*: Dilute the *Standard stock solution* quantitatively with chloroform to obtain *Standard solutions* having the compositions shown in Table 1.

Table 1

Standard solution	Dilution	Concentration (mg/mL)	Percentage (for comparison with Sample solution)
A	1 in 10	0.1	0.5
B	1 in 25	0.04	0.2
C	1 in 50	0.02	0.1

Sample solution: 20 mg/mL of Nalidixic Acid in chloroform

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Alcohol, chloroform, and 5 M ammonium hydroxide (70:20:10)

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Apply the *Samples* separately, position the plate in a chromatographic chamber, and develop the chromatograms until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate with the aid of warm circulating air. Examine the plate under short-wavelength UV light. Compare the intensities of any secondary spots observed in the *Sample solution* with those of the principal spots in the *Standard solutions*.

Acceptance criteria: No secondary spot is more intense than the principal spot obtained from *Standard solution A* (0.5%), and the sum of the intensities of all secondary spots obtained from the *Sample solution* is NMT 1.0%.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 225°–231°

• **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Nalidixic Acid RS

Nalidixic Acid Oral Suspension

DEFINITION

Nalidixic Acid Oral Suspension contains NLT 95.0% and NMT 105.0% of the labeled amount of nalidixic acid ($C_{12}H_{12}N_2O_3$) in a suitable aqueous vehicle.

IDENTIFICATION

• **A.** The retention time of the nalidixic acid peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: 2.41 g/L of dibasic potassium phosphate in water

Solution B: 7.49 g/L of hexadecyltrimethylammonium bromide in methanol

Mobile phase: Methanol, *Solution A*, and *Solution B* (325:325:350), with an apparent pH of about 10.

Internal standard solution: 0.8 mg/mL of sulfanilic acid in *Mobile phase*

Standard stock solution: 0.18 mg/mL of USP Nalidixic Acid RS in methanol

Standard solution: 36 μ g/mL of USP Nalidixic Acid RS prepared as follows. Transfer 5.0 mL of *Standard stock solution* and 1.0 mL of *Internal standard solution* to a 25-mL volumetric flask. Dilute with methanol to volume.

Sample stock solution: Nominally 0.3 mg/mL of nalidixic acid prepared as follows. Transfer 150 mg of nalidixic acid from a volume of freshly mixed Oral Suspension to a 500-mL volumetric flask. Add 400 mL of methanol, and sonicate for 30 min. Shake by mechanical means for 30 min, sonicate again for 30 min, dilute with methanol to volume, mix, and filter.

Sample solution: Nominally 36 μ g/mL of nalidixic acid prepared as follows. Transfer 3.0 mL of the clear filtrate from *Sample stock solution* and 1.0 mL of *Internal standard solution* to a 25-mL volumetric flask, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for sulfanilic acid and nalidixic acid are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1 between sulfanilic acid and nalidixic acid

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nalidixic acid ($C_{12}H_{12}N_2O_3$) in the portion of Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of nalidixic acid to sulfanilic acid from the *Sample solution*

R_S = peak area ratio of nalidixic acid to sulfanilic acid from the *Standard solution*

C_S = concentration of USP Nalidixic Acid RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of nalidixic acid in the *Sample solution* (μ g/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements for Oral Suspension packaged in single-unit containers

• **DELIVERABLE VOLUME** (698): Meets the requirements for Oral Suspension packaged in multiple-unit containers

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Nalidixic Acid RS

Nalidixic Acid Tablets

DEFINITION

Nalidixic Acid Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of nalidixic acid ($C_{12}H_{12}N_2O_3$).

IDENTIFICATION

- **A.** The retention time of the nalidixic acid peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- **USP REFERENCE STANDARDS (11)**

USP Nalidixic Acid RS

Nalorphine Hydrochloride

C₁₉H₂₁NO₃ · HCl 347.84

Morphinan-3,6-diol, 7,8-didehydro-4,5-epoxy-17-(2-propenyl)-(5α,6α)-, hydrochloride.

17-Allyl-7,8-didehydro-4,5α-epoxymorphinan-3,6α-diol hydrochloride [57-29-4].

» Nalorphine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of C₁₉H₂₁NO₃ · HCl, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Nalorphine Hydrochloride RS

Identification—

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 100 µg per mL.

Medium: water.

C: A solution of it responds to the tests for *Chloride* (191).

Specific rotation (781S): between −122° and −125°.

Test solution: 20 mg per mL, in water.

Loss on drying (731)—Dry it in vacuum at 100° for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Assay—Transfer about 25 mg of Nalorphine Hydrochloride, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and of a *Standard solution* of USP Nalorphine Hydrochloride RS in the

same medium having a known concentration of about 100 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 285 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_{19}H_{21}NO_3 \cdot HCl$ in the Nalorphine Hydrochloride taken by the formula:

$$0.25C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Nalorphine Hydrochloride RS in the Standard solution; and A_U and A_S are the absorbances of the solution of Nalorphine Hydrochloride and the Standard solution, respectively.

Nalorphine Hydrochloride Injection

» Nalorphine Hydrochloride Injection is a suitably buffered, sterile solution of Nalorphine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nalorphine hydrochloride ($C_{19}H_{21}NO_3 \cdot HCl$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Nalorphine Hydrochloride RS

Identification—Apply 15 µL of Injection and 15 µL of a Standard solution of USP Nalorphine Hydrochloride RS in methanol containing 5 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the applications to dry, and develop the chromatogram in an equilibrated chamber containing methanol until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Observe the plate under short- and long-wavelength UV light: the R_f value of the principal spot obtained from the Injection corresponds to that obtained from the Standard solution.

Bacterial Endotoxins Test (85)—It contains not more than 11.6 USP Endotoxin Units per mg of nalorphine hydrochloride.

pH (791): between 6.0 and 7.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of nalorphine hydrochloride, to a 25-mL centrifuge separator, add 1 mL of 3 N hydrochloric acid, and dilute with water to about 10 mL. Extract with five 5-mL portions of chloroform, separating the layers by centrifugation before drawing off each chloroform extract, and discard the chloroform extracts. Transfer the aqueous layer to a 100-mL volumetric flask with the aid of water, dilute with water to volume, and mix. Proceed as directed in the Assay under *Nalorphine Hydrochloride*, beginning with "Concomitantly determine the absorbances." Calculate the quantity, in mg, of $C_{19}H_{21}NO_3 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(0.1C / V)(A_U / A_S)$$

in which V is the volume, in mL, of Injection taken, and C , A_U , and A_S are as defined therein.

Naloxone Hydrochloride

$C_{19}H_{21}NO_4 \cdot HCl$ 363.84
Morphinan-6-one, 4,5-epoxy-3,14-dihydroxy-17-(2-propenyl)-, hydrochloride, (5α)-;
17-Allyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one hydrochloride [357-08-4].
Dihydrate 399.87
[51481-60-8].

DEFINITION

Naloxone Hydrochloride is anhydrous or contains two molecules of water of hydration. It contains NLT 98.0% and NMT 100.5% of naloxone hydrochloride ($C_{19}H_{21}NO_4 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: About 150 mg

Analysis: Dissolve the *Sample* in 25 mL of water in a small separator, and add a few drops of 6 N ammonium hydroxide slowly until no more white precipitate is formed. Extract with three 5-mL portions of chloroform, and pass the extracts through a dry filter, collecting the filtrate in a small flask. Evaporate the filtrate on a steam bath to dryness, and dry the residue at 105° for 1 h.

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: About 300 mg

Analysis: Dissolve the *Sample*, previously dried, in a mixture of 40 mL of glacial acetic acid and 10 mL of acetic anhydride. Add 10 mL of mercuric acetate TS and 1 drop of methyl violet TS. Titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 36.38 mg of naloxone hydrochloride ($C_{19}H_{21}NO_4 \cdot HCl$).

Acceptance criteria: 98.0%–100.5% on the dried basis

OTHER COMPONENTS

• CONTENT OF CHLORIDE

Sample: About 300 mg

Analysis: Dissolve the *Sample* in 50 mL of methanol contained in a 125-mL conical flask, and add 5 mL of glacial acetic acid and 2 drops of eosin Y TS. Titrate with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride.

Acceptance criteria: 9.54%–9.94% on the dried basis

IMPURITIES

• NOROXYMORPHONE HYDROCHLORIDE [(–)-4,5α-EPOXY-3,14-DIHYDROXYMORPHINAN-6-ONE HYDROCHLORIDE] AND OTHER IMPURITIES

Standard solution A: 7.6 mg/mL of USP Naloxone RS in chloroform

Standard solution B: 0.084 mg/mL of USP Noroxymorphone Hydrochloride RS in dilute methanol (3 in 5)

Sample solution: Transfer about 40 mg to a 5-mL volumetric flask. Dissolve completely in 2.0 mL of water, add methanol to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel, previously activated by heating for 15 min at 105°

Application volume: 5 µL

Developing solvent system: A solution (1 in 20) of methanol in ammoniacal butanol, prepared by shaking 100 mL of butyl alcohol with 60 mL of ammonium hydroxide solution (1 in 100) and discarding the lower layer

Spray reagent: 5 mg/mL of potassium ferricyanide in ferric chloride solution (1 in 10). Prepare immediately before use.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram, protected from light, until the solvent front has moved about 10 cm from the point of application. Remove the plate, dry thoroughly, and spray with *Spray reagent*.

Acceptance criteria: Other than the principal spot corresponding in R_f value to that of USP Naloxone RS and the spot at the origin (ammonium chloride), no other spot is more intense than the spot corresponding to that of USP Noroxymorphone Hydrochloride RS (1.0%).

SPECIFIC TESTS• **OPTICAL ROTATION**, *Specific Rotation* (781S)

Sample solution: 25 mg/mL in water

Acceptance criteria: −170° to −181°

• **LOSS ON DRYING** (731)

Analysis: Dry at 105° to constant weight.

Acceptance criteria: NMT 0.5% for the anhydrous form and NMT 11.0% for the hydrous form

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

• **USP REFERENCE STANDARDS** (11)

USP Naloxone RS

USP Noroxymorphone Hydrochloride RS

Naloxone Hydrochloride Injection

» Naloxone Hydrochloride Injection is a sterile, isotonic solution of Naloxone Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of naloxone hydrochloride ($C_{19}H_{21}NO_4 \cdot HCl$). It may contain suitable preservatives.

Packaging and storage—Preserve in single-dose or in multiple-dose containers of Type I glass, protected from light.

USP Reference standards (11)—

USP Endotoxin RS

USP Naloxone RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 500 USP Endotoxin Units per mg of Naloxone Hydrochloride.

pH (791): between 3.0 and 6.5.

Limit of 2,2'-binaloxone—

Mobile phase, Diluting solvent, System suitability preparation, and Chromatographic system—Prepare as directed in the *Assay*.

Ferric chloride solution—Transfer 4 mL of ferric chloride TS to a 100-mL volumetric flask, dilute with water to volume, and mix.

Identification solution—Dissolve 10 mg of naloxone in 100 mL of 0.1 N hydrochloric acid. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and add 0.5 mL of *Ferric chloride solution*. Heat on a steam bath for 10 minutes, cool, dilute with water to volume, and mix.

Standard solution—Transfer 2.0 mL of the *Standard preparation* prepared as directed in the *Assay* to a 100-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 100 µL) of the *Identification solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the peak responses for naloxone and 2,2'-binaloxone. The relative retention times are about 2.8 for the naloxone dimer and 1.0 for naloxone. Calculate the percentage of 2,2'-binaloxone in the volume of Injection taken by the formula:

$$(100 / L)(363.84 / 327.38)(C / 1.8)(V_b / V)(r_u / r_s)$$

in which L is the labeled quantity, in µg per mL, of naloxone hydrochloride ($C_{19}H_{21}NO_4 \cdot HCl$) in the Injection taken, 363.84 and 327.38 are the molecular weights of anhydrous naloxone hydrochloride and naloxone, respectively, C is the concentration, in µg per mL, of USP Naloxone RS in the *Standard solution*, 1.8 is the ratio of UV absorptivity of 2,2'-binaloxone to that of naloxone hydrochloride, V_b is the volume, in mL, of the *Test solution*, V is the volume, in mL, of Injection taken, r_u is the peak response for 2,2'-binaloxone obtained from the *Test solution*, and r_s is the peak response for naloxone obtained from the *Standard solution*. Not more than 4.0% is found.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 1.36 g of sodium 1-octanesulfonate, 1.0 g of sodium chloride, 580 mL of water, 420 mL of methanol, and 1.0 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

Diluting solvent—Transfer 150 mg of edetate disodium to a 2000-mL volumetric flask, and add 0.9 mL of hydrochloric acid. Dilute with water to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Naloxone RS in *Diluting solvent*, and dilute quantitatively, and stepwise if necessary, with *Diluting solvent* to obtain a solution having a known concentration of about 10 µg per mL.

Assay preparation 1 (for Injection labeled to contain not more than 100 µg of naloxone hydrochloride per mL)—Transfer an accurately measured volume of Injection, equivalent to about 100 µg of naloxone hydrochloride, to a 10-mL volumetric flask, add *Diluting solvent* to volume, and mix.

Assay preparation 2 (for Injection labeled to contain more than 100 µg of naloxone hydrochloride per mL)—Transfer an accurately measured volume of Injection, equivalent to about 2000 µg of naloxone hydrochloride, to a 200-mL volumetric flask, add *Diluting solvent* to volume, and mix.

System suitability preparation—Prepare a solution in *Diluting solvent* containing about 20 µg of USP Naloxone RS and about 2.5 µg of acetaminophen per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 229-nm detector

and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation* (about 100 µL) and the *System suitability preparation* (about 20 µL), and record the peak responses as directed under *Procedure*: the resolution, R , between the acetaminophen and naloxone peaks is not less than 8, and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.5%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the appropriate *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for acetaminophen and 1.0 for naloxone. Calculate the quantity, in µg, of $C_{19}H_{21}NO_4 \cdot HCl$ in each mL of the injection taken by the formula:

$$(363.84 / 327.38)V_a(C / V)(r_U / r_S)$$

in which 363.84 and 327.38 are the molecular weights of anhydrous naloxone hydrochloride and naloxone, respectively; V_a is the volume, in mL, of the *Assay preparation*; C is the concentration, in µg per mL, of USP Naloxone RS in the *Standard preparation*; V is the volume, in mL, of injection taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Naltrexone Hydrochloride

$C_{20}H_{23}NO_4 \cdot HCl$ 377.86

Morphinan-6-one, 17-(cyclopropylmethyl)-4,5-epoxy-3,14-dihydroxy-, hydrochloride, (5 α)-

17-(Cyclopropylmethyl)-4,5 α -epoxy-3,14-dihydroxymorphinan-6-one hydrochloride [16676-29-2].

» Naltrexone Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{20}H_{23}NO_4 \cdot HCl$, calculated on the anhydrous, solvent-free basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Naltrexone RS

USP Naltrexone Related Compound A RS

N-(3-Butenyl)-noroxymorphone hydrochloride.

$C_{20}H_{23}NO_4 \cdot HCl$ 377.87

Completeness of solution (641)—A 650-mg portion dissolves in 10 mL of water to yield a clear solution.

Identification, Infrared Absorption (197K)—

Test specimen—Dissolve about 150 mg in 25 mL of water in a small separator, add a few drops of 6 N ammonium hydroxide slowly until no more white precipitate is formed. Extract with three 5-mL portions of chloroform, filter the extracts through a dry filter, collecting the filtrate in a small flask. Evaporate the filtrate on a steam bath to dryness, and dry the residue at 105° for one hour.

Specific rotation (781S): between −187° and −197°, calculated on the anhydrous, solvent-free basis.

Test solution: 25 mg per mL, in water.

Water Determination, Method I (921)—Determine the water content as directed. [NOTE—The result of this test is used in the calculation of *Limit of total solvents*.]

Residue on ignition (281): not more than 0.1%.

Delete the following:

Heavy metals, Method II (231): not more than 0.002%. • (Official 1-Jan-2018)

Limit of total solvents—

Internal standard stock solution—Transfer 6.0 mL of isopropyl alcohol to a 500-mL volumetric flask, dilute with water to volume, and mix. [NOTE—The isopropyl alcohol must be free of alcohol impurities.]

Internal standard solution—Transfer 5.0 mL of the *Internal standard stock solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solution—Prepare a solution of methanol and alcohol (C_2H_5OH) in water to obtain a solution having a known concentration of about 16 mg of each per mL. Transfer 3.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer about 75 mg of Naltrexone Hydrochloride, accurately weighed, to a suitable container, add 5.0 mL of *Internal standard solution*, and shake to dissolve.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 1.8-m glass column packed with 80- to 100-mesh support S3. The column temperature is maintained at 150°, and the injection port and detector temperatures are maintained at 170°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.24 for methanol, 0.53 for alcohol, and 1.0 for isopropyl alcohol.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the gas chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentages of methanol and alcohol in the portion of Naltrexone Hydrochloride taken by the formula:

$$100(C_S / C_U)(R_U / R_S)$$

in which C_S is the concentration, in mg per mL, of methanol or alcohol (C_2H_5OH) in the *Standard solution*; C_U is the concentration, in mg per mL, of Naltrexone Hydrochloride in the *Test solution*; and R_U and R_S are the peak response ratios of methanol or alcohol to isopropyl alcohol obtained from the *Test solution* and the *Standard solution*, respectively. To the sum of the percentages of methanol and alcohol, add the percentage of water as determined in the test for *Water*: the sum of water and alcoholic solvents is not more than 5.0% for the anhydrous form, and not more than 11.0% for the dihydrate form.

Change to read:

Related compounds—Proceed as directed in the *Assay*. From the chromatogram of the *Assay preparation*, calculate the percentage of each related compound in Naltrexone Hydrochloride taken by the formula:

$$100F(C/W)(r_U/r_S) \bullet \text{ (ERR 1-Jun-2016)}$$

in which F is the relative response factor for each impurity; C is the concentration, in mg per mL, of USP Naltrexone RS in the *Standard preparation*; W is the weight, in mg, of Naltrexone Hydrochloride taken for the *Assay preparation*; r_U is the peak response of the relevant related compound ob-

tained from the *Assay preparation*; and r_s is peak response of naltrexone obtained from the *Standard preparation*. [NOTE—The relative response factor is 0.43 for 2,2'-bisnaltrexone, 0.25 for 10-ketonaltrexone, and 1.0 for all other related compound peaks.] Not more than 0.5% of any individual related compound is found, and the total of all related compounds is not more than 1.5%.

Content of chloride—Transfer about 300 mg, accurately weighed, to a 250-mL conical flask, add 50 mL of methanol, 50 mL of water, and 3 mL of nitric acid, and mix to dissolve. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride: between 9.20% and 9.58%, calculated on the anhydrous, solvent-free basis is found.

Assay—

Solution A—Dissolve about 1.08 g of sodium 1-octanesulfonate and about 23.8 g of sodium acetate in 800 mL of water. Add 1.0 mL of triethylamine and 200 mL of methanol, and mix. Adjust with glacial acetic acid to a pH of 6.5 \pm 0.1. Filter and degas prior to use.

Solution B—Dissolve about 1.08 g sodium 1-octanesulfonate and about 23.8 g sodium acetate in 400 mL of water. Add 1.0 mL triethylamine and 600 mL of methanol, and mix. Adjust with glacial acetic acid to a pH of 6.5 \pm 0.1. Filter and degas prior to use.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

Standard preparation—Transfer an accurately weighed quantity of about 22.5 mg of USP Naltrexone RS to a 10-mL volumetric flask. Add 1.5 mL of methanol and 0.6 mL of 0.1 N hydrochloric acid. Dissolve by swirling the flask, and dilute with 0.1 M phosphoric acid to volume.

Resolution solution—Transfer about 3.0 mg, accurately weighed, of USP Naltrexone Related Compound A RS to a 10-mL volumetric flask. Add 3.0 mL of methanol, and dissolve by swirling. Dilute with 0.1 M phosphoric acid to volume, and mix. Transfer 0.5 mL of this solution to a 10-mL volumetric flask, add 5.0 mL of *Standard preparation*, dilute with 0.1 M phosphoric acid to volume, and mix.

Assay preparation—Transfer an accurately weighed quantity of about 25 mg of Naltrexone Hydrochloride to a 10-mL volumetric flask. Dissolve in and dilute with 0.1 M phosphoric acid to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm \times 15-cm column that contains packing L1 and is programmed to provide, at a flow rate of about 1 mL per minute, a variable mixture of *Solution A* and *Solution B*. At the time the specimen is injected into the chromatograph, the percentage of *Solution A* is 100%; over the next 35 minutes, the proportion of *Solution B* is increased linearly to 100%, and then over the next minute, decreased linearly to 100% of *Solution A*. Allow the system to equilibrate until the late eluting peak has been observed, approximately 17 minutes later. Chromatograph about 20 μ L of the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.55 for noroxymorphone, 0.70 for 10-hydroxynaltrexone, 1.0 for naltrexone, 1.26 for naltrexone related compound A, 1.80 for 2,2'-bisnaltrexone, and 1.99 for 10-ketonaltrexone; the resolution, R , between naltrexone and naltrexone related compound A is not less than 2.0; the tailing factor for the naltrexone peak is not greater than 1.4; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in

mg, of $C_{20}H_{23}NO_4 \cdot HCl$ in the portion of Naltrexone Hydrochloride taken by the formula:

$$(377.86/341.40)10C(r_U/r_S)$$

in which 377.86 and 341.40 are the molecular weights of naltrexone hydrochloride and naltrexone, respectively; C is the concentration, in mg per mL, of USP Naltrexone RS in the *Standard preparation*; and r_U and r_S are the peak responses of naltrexone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Naltrexone Hydrochloride Tablets

» Naltrexone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of naltrexone hydrochloride ($C_{20}H_{23}NO_4 \cdot HCl$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Naltrexone RS

USP Naltrexone Related Compound A RS

N-(3-Butenyl)-noroxymorphone hydrochloride.

$C_{20}H_{23}NO_4 \cdot HCl$ 377.87

Identification—The retention time of the major peak for naltrexone in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Determine the amount of $C_{20}H_{23}NO_4 \cdot HCl$ dissolved using the method described below.

0.05 M Buffer solution—Dissolve 7.0 g of monobasic sodium phosphate in 1 L of water.

Mobile phase—Prepare a mixture of 600 mL of 0.05 M *Buffer solution*, 1.1 g of sodium 1-octane sulfonate monohydrate and 400 mL of methanol. Adjust with dilute sodium hydroxide to a pH of 6.7 \pm 0.05, if necessary, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm \times 15-cm column that contains packing L1 and is heated to 45°. The flow rate is about 1 mL per minute. Is chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

Procedure—Inject a volume (about 100 μ L) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the amount of $C_{20}H_{23}NO_4 \cdot HCl$ dissolved in comparison with a *Standard solution* having a known concentration of USP Naltrexone RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{20}H_{23}NO_4 \cdot HCl$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Solution A, **Solution B**, **Mobile phase**, **Resolution solution**, **Standard preparation**, and **Chromatographic system**—Proceed as directed in the *Assay* under *Naltrexone Hydrochloride*.

Assay preparation—Transfer not fewer than 20 Tablets to a tared container, and determine the average Tablet weight.

Grind the Tablets to a homogeneous mixture. Transfer an accurately weighed portion, equivalent to about 250 mg of naltrexone hydrochloride, to a 100-mL volumetric flask. Add about 80 mL of 0.1 M phosphoric acid, and shake or sonicate for at least 30 minutes. Dilute with 0.1 M phosphoric acid to volume, mix, and filter.

Procedure—Proceed as directed for *Procedure* in the Assay under *Naltrexone Hydrochloride*. Calculate the quantity, in mg, of naltrexone hydrochloride ($C_{20}H_{23}NO_4 \cdot HCl$) in the portion of Tablets taken by the formula:

$$(377.86/341.40)100C(r_U / r_S)$$

in which the terms are defined therein.

Nandrolone Decanoate

$C_{28}H_{44}O_3$ 428.65
Estr-4-en-3-one, 17-[(1-oxodecyl)oxy]-, (17 β)-.
17 β -Hydroxyestr-4-en-3-one decanoate [360-70-3].

» Nandrolone Decanoate contains not less than 97.0 percent and not more than 103.0 percent of $C_{28}H_{44}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a refrigerator.

USP Reference standards (11)—

USP Nandrolone RS
USP Nandrolone Decanoate RS

Completeness and clarity of solution—A solution in dioxane (1 in 50) is clear.

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 μ g per mL.

Medium: alcohol.

Absorptivities at 239 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: Prepare a solution in acetone containing 5 mg per mL. Apply 10 μ L of this solution and 10 μ L of a solution of USP Nandrolone Decanoate RS in acetone containing 5 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-heptane and acetone (3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a solution of sulfuric acid in alcohol (1 in 50) and heating in an oven at 110° for 15 minutes: the R_F value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

Melting range (741): between 33° and 37°.

Specific rotation (781S): between +32° and +36°.

Test solution: 10 mg per mL, previously dried in dioxane.

Loss on drying (731)—Dry it in vacuum over silica gel for 4 hours: it loses not more than 0.5% of its weight.

Chromatographic purity—

Mobile phase—Prepare a filtered and degassed mixture of chromatographic *n*-heptane and *n*-propyl alcohol (HPLC grade) (97:3). Make adjustments if necessary (see *System suitability* under *Chromatography* (621)).

System suitability solution—Dissolve accurately weighed quantities of USP Nandrolone Decanoate RS, dimethyl phthalate, and USP Nandrolone RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.25 mg per mL, 0.25 mg per mL, and 0.16 mg per mL, respectively.

Test solution—Transfer about 13 mg of Nandrolone Decanoate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm \times 25-cm column that contains packing L10. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.67 for dimethyl phthalate and 1.0 for nandrolone decanoate; the resolution, R , between dimethyl phthalate and nandrolone decanoate is not less than 9.0, and the nandrolone peak elutes before 4.5 times the elution time of nandrolone decanoate; the tailing factor is not more than 1.3 for the nandrolone decanoate and dimethyl phthalate peaks; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 20 μ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Nandrolone Decanoate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all of the peaks: the sum of all impurities is not more than 3.0%.

Assay—[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase—Prepare a filtered and degassed mixture of methanol and water (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer an accurately weighed quantity of USP Nandrolone Decanoate RS to a suitable volumetric flask, and dilute with methanol to volume to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer an accurately weighed quantity of about 20 mg of Nandrolone Decanoate to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and an 8-mm \times 10-cm analytical column containing packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, k' , is not less than 1.3; the column efficiency is not less than 8000 theoretical plates; the tailing factor is not less than 0.9 and not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of $C_{28}H_{44}O_3$ in the portion of Nandrolone Decanoate taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Nandrolone Decanoate RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nandrolone Decanoate Injection

» Nandrolone Decanoate Injection is a sterile solution of Nandrolone Decanoate in Sesame Oil, with a suitable preservative. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nandrolone decanoate ($C_{28}H_{44}O_3$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards (11)—

USP Nandrolone RS

USP Nandrolone Decanoate RS

Identification—Dilute a volume of Injection with acetone to provide a solution containing approximately 5 mg of nandrolone decanoate per mL. This solution responds to *Identification test C* under *Nandrolone Decanoate*, 5- μ L portions of the test solution and the Standard solution being used.

Limit of nandrolone—

Standard preparation—Dissolve 25.0 mg of USP Nandrolone RS in 50.0 mL of acetone. Dilute 5.0 mL of this solution with acetone to 50.0 mL, and mix.

Test preparation—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of nandrolone decanoate, to a 10-mL volumetric flask, dilute with acetone to volume, and mix.

Procedure—Apply 10 μ L each of the *Standard preparation* and of the *Test preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-heptane and acetone (3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Return the dry plate to the developing chamber containing the same solvent system, and again develop the chromatogram until the solvent front has moved the same distance from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a 4 in 10 solution of sulfuric acid in methanol and heating at about 100° for 10 minutes. Cool, and examine under long-wavelength UV light: any yellow fluorescent spot from the *Test preparation* at an R_f value of about 0.2 is not greater in size or intensity than that produced by the *Standard preparation* at the same R_f value, corresponding to not more than 1.0% of nandrolone.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

0.02 M Ammonium acetate solution—Transfer about 1.6 g of ammonium acetate to a 1-liter volumetric flask. Dissolve in and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of alcohol and 0.02 M Ammonium acetate solution (66:34). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Nandrolone Decanoate RS with tetrahydrofuran, and dilute quantitatively and stepwise if necessary, with tetrahydrofuran to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 400 mg of nandrolone decanoate to a 200-mL volumetric flask, dilute with tetrahydrofuran to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with tetrahydrofuran to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 15-cm column containing 5- μ m packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, k' , for nandrolone decanoate is not less than 5.3; the tailing factor for the Nandrolone Decanoate peak is not more than 1.4; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{28}H_{44}O_3$ in each mL of the Injection taken by the formula:

$$2000(C/V) (r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Nandrolone Decanoate RS in the *Standard preparation*; V is the volume, in mL, of the injection taken to prepare the *Assay preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nandrolone Phenpropionate

$C_{27}H_{34}O_3$ 406.56

Estr-4-en-3-one, 17-(1-oxo-3-phenylpropoxy)-, (17 β)-

17 β -Hydroxyestr-4-en-3-one hydrocinnamate [62-90-8].

» Nandrolone Phenpropionate contains not less than 97.0 percent and not more than 103.0 percent of $C_{27}H_{34}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nandrolone Phenpropionate RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 μ g per mL.

Medium: alcohol.

Absorptivities at 239 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: Prepare a solution in acetone containing 5 mg per mL. Apply 10 μ L of this solution and 10 μ L of a solution of USP Nandrolone Phenpropionate RS in acetone containing 5 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and de-

velop the chromatogram in a solvent system consisting of a mixture of *n*-heptane and acetone (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a 1 in 50 mixture of sulfuric acid in alcohol and heating at 110° for 15 minutes: the R_f value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

Melting range (741): between 95° and 99°.

Specific rotation (781S): between +48° and +51°.

Test solution: 20 mg per mL, in dioxane.

Loss on drying (731)—Dry it in a suitable vacuum drying tube, using phosphorus pentoxide as the desiccant, at 80° for 3 hours: it loses not more than 0.5% of its weight.

Assay—

Standard preparation—Prepare as directed under *Single-Steroid Assay* (511), using USP Nandrolone Phenpropionate RS.

Assay preparation—Weigh accurately about 20 mg of Nandrolone Phenpropionate, previously dried, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 mL, and mix.

Procedure—Proceed as directed for *Procedure under Single-Steroid Assay* (511), using a solvent system consisting of a mixture of *n*-heptane and acetone (3:1), through the fourth sentence of the second paragraph under *Procedure*. Then centrifuge the tubes for 5 minutes, and determine the absorbances of the supernatants in 1-cm cells at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{27}H_{34}O_3$ in the portion of Nandrolone Phenpropionate taken by the formula:

$$10C(A_U / A_S)$$

in which *C* is the concentration, in mg per mL, of USP Nandrolone Phenpropionate RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Nandrolone Phenpropionate Injection

» Nandrolone Phenpropionate Injection is a sterile solution of Nandrolone Phenpropionate in a suitable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nandrolone phenpropionate ($C_{27}H_{34}O_3$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards (11)—

USP Nandrolone RS

Identification—Dilute the Injection with acetone to obtain a solution containing 5 mg of nandrolone phenpropionate in each mL. Proceed as directed for *Identification test C* under *Nandrolone Phenpropionate*, beginning with "Apply 10 μ L of this solution."

Limit of nandrolone—

Standard preparation—Prepare as directed in the test for *Limit of nandrolone* under *Nandrolone Decanoate Injection*.

Test preparation—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of nandrolone phenpropionate, to a 10-mL volumetric flask, dilute with acetone to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the test for *Limit of nandrolone* under *Nandrolone Decanoate Injection*.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Isoniazid reagent—Dissolve 500 mg of isoniazid in about 250 mL of methanol, add 0.63 mL of hydrochloric acid, dilute with methanol to 500.0 mL, and mix.

Standard preparation—Transfer about 25 mg of USP Nandrolone Phenpropionate RS, accurately weighed, to a 100-mL volumetric flask, dissolve in chloroform, dilute with chloroform to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of nandrolone phenpropionate, to a 200-mL volumetric flask, dilute with chloroform to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with chloroform to volume, and mix.

Procedure—Transfer 5.0 mL each of the *Standard preparation*, of the *Assay preparation*, and of chloroform to provide the blank, to separate 10-mL volumetric flasks, dilute each flask with *Isoniazid reagent* to volume, and mix. Allow the flasks to stand for 1 hour with occasional shaking. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 380 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{27}H_{34}O_3$ in each mL of the Injection taken by the formula:

$$(2C / V)(A_U / A_S)$$

in which *C* is the concentration, in μ g per mL, of USP Nandrolone Phenpropionate RS in the *Standard preparation*, *V* is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Naphazoline Hydrochloride

$C_{14}H_{14}N_2 \cdot HCl$ 246.74
1*H*-Imidazole, 4,5-dihydro-2-(1-naphthalenylmethyl)-, monohydrochloride;
2-(1-Naphthylmethyl)-2-imidazoline monohydrochloride [550-99-2].

DEFINITION

Naphazoline Hydrochloride contains NLT 98.0% and NMT 102.0% of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (17K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

Sample solution: 10 mg/mL in water

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Buffer: In a 1000-mL volumetric flask, dissolve 3.0 g of monobasic potassium phosphate in 800 mL of water.

Add 3.0 mL of triethylamine, adjust with phosphoric acid to a pH of 3.0, and dilute with water to volume.

Mobile phase: Acetonitrile and Buffer (20:80)

Standard solution: 0.05 mg/mL of USP Naphazoline Hydrochloride RS in water

Sample solution: 0.05 mg/mL of Naphazoline Hydrochloride in water

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 280 nm

Column: 4.0-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$) in the portion of Naphazoline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Naphazoline Hydrochloride RS in the Standard solution (mg/mL)

C_U = concentration of Naphazoline Hydrochloride in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.2%

• **ORGANIC IMPURITIES**

Solution A: Acetonitrile, glacial acetic acid, and water (30:0.5:70)

Mobile phase: 1.1 g/L of anhydrous sodium 1-octanesulfonate in Solution A

System suitability solution: 0.025 mg/mL of USP Naphazoline Hydrochloride RS and 0.05 mg/mL of 1-naphthylacetic acid in Mobile phase

Standard solution: 0.5 µg/mL each of USP Naphazoline Hydrochloride RS and USP Naphazoline Related Compound A RS in Mobile phase

Sample solution: 0.5 mg/mL of Naphazoline Hydrochloride in Mobile phase

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 280 nm

Column: 4.0-mm × 25-cm; 3-µm or 5-µm packing L7

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: NLT 3 times the retention time of the naphazoline peak

System suitability

Sample: System suitability solution

Suitability requirements

Resolution: NLT 5.0 between the naphazoline and 1-naphthylacetic acid peaks

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of naphazoline related compound A in the portion of Naphazoline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of naphazoline related compound A from the Sample solution

r_S = peak response of naphazoline related compound A from the Standard solution

C_S = concentration of USP Naphazoline Related Compound A RS in the Standard solution (mg/mL)

C_U = concentration of Naphazoline Hydrochloride in the Sample solution (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Naphazoline Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any individual unspecified impurity from the Sample solution

r_S = peak response of naphazoline from the Standard solution

C_S = concentration of USP Naphazoline Hydrochloride RS in the Standard solution (mg/mL)

C_U = concentration of Naphazoline Hydrochloride in the Sample solution (mg/mL)

Acceptance criteria

Individual impurities: See Table 1. Disregard any impurity peaks less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Naphazoline related compound A	0.76	0.1
Naphazoline	1.0	—
1-Naphthylacetic acid	1.4	0.10
Any individual unspecified impurity	—	0.10
Total impurities	—	0.5

SPECIFIC TESTS

• **pH** (791)

Sample solution: 10 mg/mL in carbon dioxide-free water

Acceptance criteria: 5.0–6.6. The Sample solution is clear and colorless.

• **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** (11)

USP Naphazoline Hydrochloride RS

USP Naphazoline Related Compound A RS

N-(2-Aminoethyl)-2-(naphthalen-1-yl)acetamide.

$C_{14}H_{16}N_2O$ 228.29

Naphazoline Hydrochloride Nasal Solution

DEFINITION

Naphazoline Hydrochloride Nasal Solution is a solution of Naphazoline Hydrochloride in water adjusted to a suitable pH and tonicity. It contains NLT 90.0% and NMT 110.0% of the labeled amount of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$).

IDENTIFICATION

- A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Dissolve 1.1 g of sodium 1-heptanesulfonate in 400 mL of water. Add 250 mL of acetonitrile and 10 mL of glacial acetic acid, and dilute with water to 1000 mL. Sonicate for 10 min to obtain a solution having a pH of about 3.5.

Standard solution: 0.25 mg/mL of USP Naphazoline Hydrochloride RS in water

Sample solution: Equivalent to 0.25 mg/mL of naphazoline hydrochloride in water from Nasal Solution

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4-mm \times 30-cm; packing L11

Flow rate: 2 mL/min

Injection volume: 15 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$) in the portion of Nasal Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Naphazoline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of naphazoline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- USP REFERENCE STANDARDS (11)**
USP Naphazoline Hydrochloride RS

Naphazoline Hydrochloride Ophthalmic Solution

DEFINITION

Naphazoline Hydrochloride Ophthalmic Solution is a sterile, buffered solution of Naphazoline Hydrochloride in water adjusted to a suitable tonicity. It contains NLT 90.0% and NMT 115.0% of the labeled amount of naphazoline hy-

drochloride ($C_{14}H_{14}N_2 \cdot HCl$). It contains a suitable preservative.

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: Dissolve 3 g of monobasic potassium phosphate in 1 L of water, and add 3 mL of triethylamine. Adjust with phosphoric acid to a pH of 3.

Mobile phase: Acetonitrile and *Buffer* (20:80)

Standard solution: 0.05 mg/mL of USP Naphazoline Hydrochloride RS in *Mobile phase*

Sample solution: Equivalent to 0.05 mg/mL of naphazoline hydrochloride in *Mobile phase* from Ophthalmic Solution

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm or diode array. [NOTE—Use diode array detector to perform *Identification test B*.]

Column: 4.6-mm \times 15-cm; packing L10

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Naphazoline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of naphazoline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–115.0%

SPECIFIC TESTS

- pH (791):** 5.5–7.0
- STERILITY TESTS (71):** Meets the requirements

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- USP REFERENCE STANDARDS (11)**
USP Naphazoline Hydrochloride RS

Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution

DEFINITION

Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution is a sterile, buffered solution of Naphazoline Hydrochloride and Pheniramine Maleate in water adjusted to a suitable tonicity. It contains NLT

90.0% and NMT 110.0% of the labeled amount of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$) and pheniramine maleate ($C_{16}H_{20}N_2 \cdot C_4H_4O_4$). It contains a suitable preservative.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHY

Standard solution A: 1.5 mg/mL of USP Naphazoline Hydrochloride RS in water

Standard solution B: 6.0 mg/mL of USP Pheniramine Maleate RS in water

Sample solution: Equivalent to 0.25 mg/mL of naphazoline hydrochloride and 3 mg/mL of pheniramine maleate in water from Ophthalmic Solution

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Adsorbent: 0.25-mm layer of silica gel on a 20-cm \times 20-cm chromatographic plate

Application volume: 5 μ L of *Standard solution A*, 10 μ L of *Standard solution B*, and 30 μ L of the *Sample solution*

Developing solvent system: Methanol, acetic acid, and water (8:1:1)

Spray reagent: Ninhydrin TS

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Allow the spots to dry, then place the plate in a saturated chromatographic chamber, and develop in the *Developing solvent system* until the solvent front has moved to 1.5 cm from the top of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Spray with *Spray reagent*, and place in an oven at 105° to visualize the spots. Both the naphazoline and pheniramine spots are purplish gray in color.

Acceptance criteria: The R_f values of the spots of the *Sample solution* correspond to those of *Standard solution A* and *Standard solution B*.

- **B.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer solution: Dissolve 14.2 g of anhydrous dibasic sodium phosphate and 20 mL of triethylamine in 1900 mL of water. Adjust with phosphoric acid to a pH of 5.6 ± 0.1 , and dilute with water to 2000 mL.

Mobile phase: Acetonitrile and *Buffer solution* (20:80)

Standard stock solution A: 0.75 mg/mL of USP Naphazoline Hydrochloride RS in *Mobile phase*

Standard stock solution B: 3.00 mg/mL of USP Pheniramine Maleate RS in *Mobile phase*

Standard solution: 0.03 mg/mL of naphazoline hydrochloride and 0.36 mg/mL of pheniramine maleate in *Mobile phase* prepared as follows. Transfer 1.0 mL of *Standard stock solution A* and 3.0 mL of *Standard stock solution B* to a 25-mL volumetric flask. Dilute with *Mobile phase* to volume.

Sample solution: Transfer a volume of Ophthalmic Solution, equivalent to 0.75 mg of naphazoline hydrochloride and 9.0 mg of pheniramine maleate, to a 25-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm \times 15-cm; packing L7

Flow rate: 1.5 mL/min

Injection volume: 25 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2 between the naphazoline and pheniramine peaks

Column efficiency: NLT 750 theoretical plates for the naphazoline and pheniramine peaks

Tailing factor: NMT 2.5 for pheniramine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of naphazoline from the *Sample solution*

r_S = peak response of naphazoline from the *Standard solution*

C_S = concentration of USP Naphazoline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of naphazoline hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of pheniramine maleate ($C_{16}H_{20}N_2 \cdot C_4H_4O_4$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pheniramine from the *Sample solution*

r_S = peak response of pheniramine from the *Standard solution*

C_S = concentration of USP Pheniramine Maleate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pheniramine maleate in the *Sample solution* (mg/mL)

Acceptance criteria

Naphazoline hydrochloride: 90.0%–110.0%

Pheniramine maleate: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** 5.7–6.3

- **STERILITY TESTS (71):** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*, Membrane Filtration.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature between 20° and 25°, protected from light.

- **USP REFERENCE STANDARDS (11)**
USP Naphazoline Hydrochloride RS
USP Pheniramine Maleate RS

Naproxen

$C_{14}H_{14}O_3$ 230.26
2-Naphthaleneacetic acid, 6-methoxy- α -methyl-, (S)-
(+)-(S)-6-Methoxy- α -methyl-2-naphthaleneacetic acid
[22204-53-1].

» Naproxen contains not less than 98.5 percent and not more than 101.5 percent of $C_{14}H_{14}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Naproxen RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 25 μ g per mL.

Medium: methanol.

Absorptivities at 271 nm, calculated on the dried basis, do not differ by more than 3%.

Specific rotation (781S): between +83.0° and +89.5°.

Test solution: 10 mg per mL, in methyl isobutyl ketone.

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Delete the following:

• **Heavy metals, Method II (231):** 0.002%. (Official 1-Jan-2018)

Chromatographic purity—Dissolve 100 mg of Naproxen in methanol, and dilute with methanol to 5.0 mL to obtain the *Test solution*. Dissolve a suitable quantity of USP Naproxen RS in methanol to obtain a *Standard solution* having a known concentration of about 20 mg per mL. Dilute a portion of this solution quantitatively and stepwise with methanol to obtain three *Comparison solutions* having concentrations of 20, 60, and 100 μ g per mL (0.1%, 0.3%, and 0.5% of the *Standard solution*), respectively. Apply separate 10- μ L portions of the five solutions to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography (621)*) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of toluene, tetrahydrofuran, and glacial acetic acid (30:3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, air-dry, and view under short-wavelength UV light: the R_f value of the principal spot in the chromatogram of the *Test solution* corresponds to that of the *Standard solution*, and any other spot obtained from the *Test solution* does not exceed, in size or intensity, the principal spot obtained from the 100- μ g-per-mL *Comparison solution* (0.5%), and the sum of the intensities of any secondary spots, similarly compared, does not exceed 2.0%.

Assay—Dissolve about 500 mg of Naproxen, accurately weighed, in a mixture of 75 mL of methanol and 25 mL of water that has been previously neutralized to the phenolphthalein endpoint with 0.1 N sodium hydroxide. Dissolve by gentle warming, if necessary, add phenolphthalein TS,

and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 23.03 mg of $C_{14}H_{14}O_3$.

Naproxen Oral Suspension

DEFINITION

Naproxen Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of naproxen ($C_{14}H_{14}O_3$).

IDENTIFICATION

• A.

Sample solution: *Standard solution* and *Sample solution* (1:1), prepared as directed in the *Assay*

Analysis: Chromatograph as directed in the *Assay*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits two main peaks corresponding to naproxen and the internal standard.

ASSAY

• PROCEDURE

Mobile phase: Prepare a mixture of 500 mL of methanol, 500 mL of water, and 2.46 g of anhydrous sodium acetate, and mix until dissolved. Adjust with glacial acetic acid to a pH of 5.8.

Internal standard solution: 1.1 mg/mL of ethylparaben in methanol

Standard stock solution: Transfer about 62.5 mg of USP Naproxen RS, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of methanol, and sonicate to dissolve. Add 5.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

Standard solution: 0.05 mg/mL of USP Naproxen RS and 0.0044 mg/mL of ethylparaben in *Mobile phase* from *Standard stock solution*

Sample stock solution: Transfer an accurately measured volume of Oral Suspension, previously well-mixed and free from air bubbles, nominally equivalent to about 125 mg of naproxen, to a 100-mL volumetric flask, using a "to contain" pipet. Rinse the pipet several times with methanol, and add the rinsings to the volumetric flask. Add 10.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

Sample solution: Nominally equivalent to 0.05 mg/mL of naproxen and 0.0044 mg/mL of ethylparaben in *Mobile phase* from *Sample stock solution*. Filter if necessary to obtain a clear solution.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 35 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethylparaben and naproxen are 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between ethylparaben and naproxen

Tailing factor: NMT 2.0 for the naproxen peak

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naproxen ($C_{14}H_{14}O_3$) in the portion of Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of naproxen to ethylparaben from the *Sample solution*

- R_s = peak response ratio of naproxen to ethylparaben from the *Standard solution*
 C_s = concentration of USP Naproxen RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of naproxen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DELIVERABLE VOLUME** (698): Meets the requirements for oral suspension packaged in multiple-unit containers
- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements for oral suspension packaged in single-unit containers

SPECIFIC TESTS

- **PH** (791): 2.2–3.7

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Naproxen RS

Naproxen Tablets

DEFINITION

Naproxen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of naproxen ($C_{14}H_{14}O_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B.** The UV absorption spectra of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Acetonitrile, water, and glacial acetic acid (450:540:10)

Standard solution: 0.1 mg/mL of USP Naproxen RS in *Mobile phase*

Sample stock solution: Nominally equivalent to 1 mg/mL of naproxen in *Mobile phase*. Transfer an amount equivalent to about 500 mg of naproxen, from NLT 10 finely powdered Tablets, to a 500-mL volumetric flask. Add about 300 mL of *Mobile phase*, and sonicate for 30 min. Cool to room temperature, and dilute with *Mobile phase* to volume.

Sample solution: Nominally equivalent to 0.1 mg/mL of naproxen in *Mobile phase* from *Sample stock solution*. Pass through a suitable filter of 0.45- μ m of pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254-nm diode array

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Flow rate: 1.2 mL/min

Injection volume: 20 μ L

Run time: NLT 2 times the retention time of naproxen

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NLT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naproxen ($C_{14}H_{14}O_3$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of naproxen from the *Sample solution*

r_s = peak response of naproxen from the *Standard solution*

C_s = concentration of USP Naproxen RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of naproxen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Buffer: 0.1 M of pH 7.4 phosphate buffer prepared as follows. Dissolve 2.62 g of monobasic sodium phosphate and 11.50 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and mix.

Medium: *Buffer*, 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: A known concentration of USP Naproxen RS in *Buffer*

Sample solution: Filter portions of the solution under test, and suitably dilute with *Buffer*.

Instrumental conditions

Mode: UV

Analytical wavelength: About 332 nm (maximum absorbance)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naproxen ($C_{14}H_{14}O_3$) dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of naproxen ($C_{14}H_{14}O_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES

ORGANIC IMPURITIES

Buffer: Dissolve 1.36 g of monobasic potassium phosphate in 1 L of water. Adjust with triethylamine to a pH of 6.5. Pass through a suitable filter of 0.45- μ m pore size.

Diluent: Acetonitrile and *Buffer* (50:50)

Mobile phase: See Table 1.

Table 1

Time (min)	Buffer (%)	Acetonitrile (%)
0	85	15
5	85	15
25	60	40
45	50	50

Table 1 (Continued)

Time (min)	Buffer (%)	Acetonitrile (%)
50	85	15
60	85	15

Standard stock solution 1: Prepare 5 mg/mL of USP Naproxen RS in *Diluent*. Further dilute this solution with *Diluent* to obtain 0.05 mg/mL of USP Naproxen RS in *Diluent*.

Standard stock solution 2: 0.01 mg/mL of USP Naproxen Related Compound A RS in methanol

Standard stock solution 3: 0.01 mg/mL of USP Naproxen Related Compound L RS in methanol

System suitability solution: 0.5 mg/mL of USP Naproxen RS and 0.5 µg/mL of USP Naproxen Related Compound A RS in *Diluent*, from *Standard stock solution 1* and *Standard stock solution 2*, respectively

Standard solution: 1.0 µg/mL of USP Naproxen RS, 0.5 µg/mL each of USP Naproxen Related Compound A RS and USP Naproxen Related Compound L RS in *Diluent*, from *Standard stock solution 1*, *Standard stock solution 2*, and *Standard stock solution 3*, respectively

Sample solution: Nominally equivalent to 0.5 mg/mL of naproxen from NLT 10 finely powdered Tablets. Transfer nominally equivalent to about 500 mg of naproxen to a 1000-mL volumetric flask. Add 600 mL of *Diluent*, and sonicate for 30 min with intermittent shaking. Cool to room temperature, and dilute with *Diluent* to volume. Mix, and allow to settle for 5 min. Pass through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 236 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 6.0 between naproxen related compound A and naproxen, *System suitability solution*

Relative standard deviation: NMT 5.0% for naproxen, naproxen related compound A, and naproxen related compound L, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of naproxen related compound A and naproxen related compound L in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_U/C_S) \times 100$$

r_U = peak response of naproxen related compound A or naproxen related compound L from the *Sample solution*

r_S = peak response of naproxen related compound A or naproxen related compound L from the *Standard solution*

C_S = concentration of USP Naproxen Related Compound A RS or USP Naproxen Related Compound L RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of naproxen in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of any other individual impurity from the *Sample solution*

r_S = peak response of naproxen from the *Standard solution*

C_S = concentration of USP Naproxen RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of naproxen in the *Sample solution* (mg/mL)

F = relative response factor of each individual impurity (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Naproxen related compound A ^a	0.63	—	0.10
Naproxen	1.00	—	—
Naproxen related compound L ^b	2.32	—	0.10
Naproxen methyl ester ^c	3.19	1.0	0.10
Any other individual impurity	—	1.0	0.10
Total impurities ^d	—	—	0.50

^a 6-Methoxy-2-naphthoic acid.

^b 1-(6-Methoxynaphthalen-2-yl)ethanone.

^c (S)-Methyl 2-(6-methoxynaphthalen-2-yl)propanoate.

^d Disregard any peaks below LOQ (0.004% for any other individual impurity and naproxen methyl ester, 0.002% for naproxen related compound A, and 0.006% for naproxen related compound L).

DEFINITION

Naproxen Delayed-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of naproxen (C₁₄H₁₄O₃).

IDENTIFICATION

• **A. ULTRAVIOLET ABSORPTION** <197U>

Standard solution and Sample solution: Prepare as directed in the *Buffer stage* of the *Dissolution* test.

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and 1% acetic acid solution (900:1100). Filter and degas.

Diluent A: Acetonitrile and water (9:1)

Diluent B: Acetonitrile and water (1:1)

Standard stock solution: 0.5 mg/mL of USP Naproxen RS in *Diluent A*

Standard solution: 0.1 mg/mL of USP Naproxen RS in *Mobile phase* from the *Standard stock solution*

Sample solution: Transfer an amount nominally equivalent to 250 mg of naproxen from 20 powdered Tablets into a 100-mL volumetric flask, and add about 70 mL of *Diluent B*. Shake by mechanical means for 15 min, sonicate for 15 min, dilute with *Diluent B* to volume, and mix. Pass this solution through a suitable filter of 0.45- μ m pore size. Transfer 2.0 mL of the filtrate into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1.0 mL/min

Injection volume: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of naproxen ($C_{14}H_{14}O_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of naproxen from the *Sample solution*

r_S = peak response of naproxen from the *Standard solution*

C_S = concentration of USP Naproxen RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of naproxen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION, Delayed-Release Dosage Forms, Method B (711)

Acid stage

Medium: 0.1 N hydrochloric acid; 1000 mL

Apparatus 2: 50 rpm

Time: 2 h

Standard solution: A known concentration of USP Naproxen RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium* if necessary.

Analysis: Determine the amount of naproxen ($C_{14}H_{14}O_3$) dissolved by UV absorption at the wavelength of maximum absorbance at about 332 nm with the *Sample solution* in comparison with the *Standard solution*.

Tolerances: NMT 10% (Q) of the labeled amount of naproxen ($C_{14}H_{14}O_3$) is dissolved.

Buffer stage

Buffer: 0.2 M phosphate buffer, pH 6.8

Medium: *Buffer*; 1000 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: A known concentration of USP Naproxen RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium* if necessary.

Analysis: Determine the amount of naproxen ($C_{14}H_{14}O_3$) dissolved by UV absorption at the wavelength of maximum absorbance at about 332 nm with the *Sample solution* in comparison with the *Standard solution*.

Tolerances: NLT 80% (Q) of the labeled amount of naproxen ($C_{14}H_{14}O_3$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Mobile phase, Diluent A, Diluent B, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Standard stock solution: 0.25 mg/mL of USP Naproxen RS in *Diluent A*

Standard solution: 0.1 mg/mL of USP Naproxen RS in *Diluent B* from *Standard stock solution*

Sample solution: Transfer 1 Tablet to a 200-mL volumetric flask, and add 140 mL of *Diluent B*. Shake by mechanical means for 15 min, sonicate for 15 min, and dilute with *Diluent B* to volume. Pass a portion of this solution through a suitable filter of 0.45- μ m pore size, pipet 2.0 mL of the filtrate for a 500-mg tablet and 2.5 mL for a 375-mg tablet into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS (11)**
USP Naproxen RS

Naproxen Sodium

$C_{14}H_{13}NaO_3$ 252.24

2-Naphthaleneacetic acid, 6-methoxy- α -methyl-, sodium salt, (S)-.

(-)-Sodium (S)-6-methoxy- α -methyl-2-naphthaleneacetate [26159-34-2].

» Naproxen Sodium contains not less than 98.0 percent and not more than 102.0 percent of $C_{14}H_{13}NaO_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Naproxen Sodium RS

Identification—

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 25 μ g per mL.

Medium: methanol.

Absorptivities at 272 nm, calculated on the dried basis, do not differ by more than 3%.

Specific rotation (781S): between -15.3° and -17.0° .

Test solution: 50 mg per mL, in 0.1 N sodium hydroxide.

Loss on drying (731)—Dry it in vacuum at 105° for 3 hours: it loses not more than 1.0% of its weight.

Delete the following:

• **Heavy metals, Method I** (231)—Dissolve 1.0 g in 20 mL of water in a separator, add 5 mL of 1 N hydrochloric acid, and extract with successive 20-mL, 20-mL, and 10-mL portions of methylene chloride. Discard the methylene chloride extracts, and use the aqueous layer for the test: the limit is 0.002%. • (Official 1-Jan-2018)

Free naproxen—Dissolve about 5.0 g in 25 mL of water in a separator, and extract the solution with three 15-mL portions of chloroform. Evaporate the combined extracts on a steam bath to dryness. Dissolve the residue in 10 mL of a mixture of methanol and water (3:1) previously neutralized with 0.1 N sodium hydroxide to the phenolphthalein

endpoint. Add phenolphthalein TS, and titrate with 0.10 N sodium hydroxide: not more than 2.2 mL is consumed (1.0%).

Chromatographic purity—Dissolve 100 mg in 5 mL of methanol. Dissolve a suitable quantity of USP Naproxen Sodium RS in methanol to obtain a *Standard solution* having a known concentration of about 20 mg per mL. Dilute a portion of this solution quantitatively with methanol to obtain three *Comparison solutions* having concentrations of 20, 60, and 100 µg per mL (0.1%, 0.3%, and 0.5% of the *Standard solution*), respectively. Apply separate 10-µL portions of the five solutions on the starting line to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of toluene, tetrahydrofuran, and glacial acetic acid (30:3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, air-dry, and view under short-wavelength UV light: the R_f value of the principal spot in the chromatogram of the solution under test corresponds to that of the *Standard solution*, the intensity of any individual secondary spot does not exceed that of the 100-µg-per-mL *Comparison solution* (0.5%), and the sum of the intensities of any secondary spots, similarly compared, does not exceed 2.0%.

Assay—Dissolve about 200 mg of Naproxen Sodium, accurately weighed, in 50 mL of glacial acetic acid containing 2 drops of *p*-naphtholbenzein TS previously neutralized with 0.1 N perchloric acid if necessary. Titrate with 0.1 N perchloric acid VS. Each mL of 0.1 N perchloric acid is equivalent to 25.22 mg of $C_{14}H_{13}NaO_3$.

Naproxen Sodium Tablets

DEFINITION

Naproxen Sodium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of naproxen sodium ($C_{14}H_{13}NaO_3$).

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Sodium (191)

Sample: Transfer an amount nominally equivalent to about 250 mg of naproxen sodium from finely powdered Tablets to a centrifuge tube. Add 12 mL of water and 1 mL of hydrochloric acid. A dense white precipitate is formed. Centrifuge the mixture. Use the clear supernatant for the test.

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **C.** The UV absorption spectra of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the Assay.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, water, and glacial acetic acid (450:540:10)

Standard solution: 0.1 mg/mL of USP Naproxen Sodium RS in *Mobile phase*

Sample stock solution: Nominally equivalent to 5.5 mg/mL of naproxen sodium. Transfer an amount nominally equivalent to about 2750 mg of naproxen sodium, from NLT 5 Tablets, to a 500-mL volumetric flask. Add 75 mL of water, and sonicate till the Tablets disperse. Add about 250 mL of *Mobile phase*, and sonicate for 30 min with intermittent shaking. Cool to room

temperature, and dilute with *Mobile phase* to volume. Pass through a suitable filter of 0.45-µm pore size.

Sample solution: Nominally equivalent to 0.1 mg/mL of naproxen sodium in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254-nm diode array

Column: 4.6-mm × 15-cm; 5-µm packing L7

Flow rate: 1.2 mL/min

Injection volume: 20 µL

Run time: NLT 2 times the retention time of naproxen

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naproxen sodium ($C_{14}H_{13}NaO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of naproxen from the *Sample solution*

r_s = peak response of naproxen from the *Standard solution*

C_s = concentration of USP Naproxen Sodium RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of naproxen sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Buffer: 0.1 M of pH 7.4 phosphate buffer containing 2.62 g/L of monobasic sodium phosphate and 11.50 g/L of anhydrous dibasic sodium phosphate in water

Medium: *Buffer*; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: 50 µg/mL of USP Naproxen Sodium RS in *Medium*

Sample solution: Dilute a filtered portion of the solution under test with *Medium* as necessary to obtain a nominal concentration of 50 µg/mL naproxen sodium ($C_{14}H_{13}NaO_3$).

Instrumental conditions

Mode: UV

Analytical wavelength: About 332 nm (maximum absorbance)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naproxen sodium ($C_{14}H_{13}NaO_3$) dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of naproxen sodium ($C_{14}H_{13}NaO_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer: Dissolve 1.36 g of monobasic potassium phosphate in 1 L of water. Adjust with triethylamine to a pH of 6.5. Pass through a suitable filter of 0.45-µm pore size.

Diluent: Acetonitrile and *Buffer* (50:50)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Buffer (%)	Acetonitrile (%)
0	85	15
5	85	15
25	60	40
45	50	50
50	85	15
60	85	15

Standard stock solution 1: Prepare 5 mg/mL of USP Naproxen Sodium RS in *Diluent*. Further dilute this solution with *Diluent* to obtain 0.05 mg/mL of USP Naproxen Sodium RS in *Diluent*.

Standard stock solution 2: 0.01 mg/mL of USP Naproxen Related Compound A RS in methanol

Standard stock solution 3: 0.01 mg/mL of USP Naproxen Related Compound L RS in methanol

Standard solution: 1.0 µg/mL of USP Naproxen Sodium RS, and 0.5 µg/mL each of USP Naproxen Related Compound A RS and USP Naproxen Related Compound L RS in *Diluent*, from *Standard stock solution 1*, *Standard stock solution 2*, and *Standard stock solution 3*, respectively

System suitability solution: 0.5 mg/mL of USP Naproxen Sodium RS and 0.5 µg/mL of USP Naproxen Related Compound A RS in *Diluent*, from *Standard stock solution 1* and *Standard stock solution 2*, respectively

Sample stock solution: Nominally equivalent to 5.5 mg/mL of naproxen sodium from NLT 5 finely powdered Tablets. Transfer nominally equivalent to about 2750 mg of naproxen sodium to a 500-mL volumetric flask. Add 250 mL of *Diluent*, and sonicate for 20 min with intermittent shaking. Cool to room temperature and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45-µm pore size.

Sample solution: Nominally equivalent to 0.55 mg/mL of naproxen sodium in *Diluent* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 236 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 6.0 between naproxen related compound A and naproxen, *System suitability solution*

Relative standard deviation: NMT 5.0% for naproxen, naproxen related compound A, and naproxen related compound L; *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of naproxen related compound A and naproxen related compound L in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_u/C_s) \times 100$$

r_u = peak response of naproxen related compound A or naproxen related compound L from the *Sample solution*

r_s = peak response of naproxen related compound A or naproxen related compound L from the *Standard solution*

C_s = concentration of USP Naproxen Related Compound A RS or USP Naproxen Related Compound L RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of naproxen sodium in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of any other individual impurity from the *Sample solution*

r_s = peak response of naproxen from the *Standard solution*

C_s = concentration of USP Naproxen Sodium RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of naproxen sodium in the *Sample solution* (mg/mL)

F = relative response factor of individual impurity (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Naproxen related compound A ^a	0.63	—	0.2
Naproxen	1.00	—	—
Naproxen related compound L ^b	2.32	—	0.2
Naproxen methyl ester ^c	3.19	1.0	0.2
Any other individual impurity	—	1.0	0.2
Total impurities ^d	—	—	1.5

^a 6-Methoxy-2-naphthoic acid.

^b 1-(6-Methoxynaphthalen-2-yl)ethanone.

^c (S)-Methyl 2-(6-methoxynaphthalen-2-yl)propanoate.

^d Disregard any peaks below LOQ (0.004% for any other individual impurity and naproxen methyl ester, 0.002% for naproxen related compound A, and 0.006% for naproxen related compound L).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP Naproxen Sodium RS

USP Naproxen Related Compound A RS

6-Methoxy-2-naphthoic acid.

C₁₂H₁₀O₃ 202.21

USP Naproxen Related Compound L RS

1-(6-Methoxynaphthalen-2-yl)ethanone.

C₁₃H₁₂O₂ 200.23

Narasin Granular

C₄₃H₇₂O₁₁ (narasin A) 765.03

C₄₃H₇₀O₁₁ (narasin B) 763.01

C₄₄H₇₄O₁₁ (narasin D) 779.05

C₄₄H₇₄O₁₁ (narasin I) 779.05

Narasin.

2H-Pyran-2-acetic acid, α -ethyl-6-[5-[2-(5-ethyltetrahydro-5-hydroxy-6-methyl-2H-pyran-2-yl)-15-hydroxy-2,10,12-trimethyl-1,6,8-trioxadispiro[4.1.5.3]pentadec-13-en-9-yl]-2-hydroxy-1,3-dimethyl-4-oxoheptyl]tetrahydro-3,5-dimethyl-

α -Ethyl-6-[5-[2-(5-ethyltetrahydro-5-hydroxy-6-methyl-2H-pyran-2-yl)-15-hydroxy-2,10,12-trimethyl-1,6,8-trioxadispiro[4.1.5.3]pentadec-13-en-9-yl]-2-hydroxy-1,3-dimethyl-4-oxoheptyl]tetrahydro-3,5-dimethyl-2H-pyran-2-acetic acid [55134-13-9].

» Narasin Granular contains narasin mixed with suitable carriers and inactive ingredients prepared in a granular form that is free-flowing and free of aggregates. It contains not less than 100 mg and not more than 160 mg of narasin per g.

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

Labeling—Label it to indicate that it is for animal use only. Label it also to indicate that it is for manufacturing, processing, or repackaging.

USP Reference standards (11)—

USP Monensin Sodium RS

USP Narasin RS

Identification—The retention time of the major peak for narasin A in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 3 hours; it loses not more than 10% of its weight.

Powder fineness (811)—Not less than 99% passes a No. 30 sieve, and not more than 15% passes a No. 140 sieve.

Content of narasin A—Using the chromatogram of the *Assay preparation* obtained as directed in the *Assay*, calculate the percentage of narasin A by the formula:

$$100A / [A + (D + I)]$$

in which *A* is the narasin A biopotency and *D + I* is the narasin *D + I* biopotency. Not less than 85% of narasin A is found.

Assay—

Diluent—Prepare a mixture of methanol and water (9:1).

Mobile phase—Prepare a degassed mixture of methanol, water, and glacial acetic acid (94:6:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Neutralized methanol—Add 1 g of sodium bicarbonate to 4 L of methanol, mix, and filter.

Derivatizing reagent—Dissolve 30 g of vanillin in a mixture of methanol and sulfuric acid (950:20) in a container protected from light. [Caution—To avoid splattering, add the sulfuric acid carefully and slowly with a pipet; do not pour. Allow the mixture of methanol and sulfuric acid to cool before adding the vanillin.] Do not filter.

Resolution solution—Prepare a solution in *Neutralized methanol* containing about 3 mg of USP Narasin RS and 1 mg of USP Monensin Sodium RS per mL. Transfer 2 mL of this solution to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard preparations—Dissolve an accurately weighed quantity of USP Narasin RS in *Neutralized methanol* to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this stock solution to a 200-mL volumetric flask, and transfer 2.0 mL and 4.0 mL of the stock solution to two separate 100-mL volumetric flasks, dilute each with *Diluent* to volume, and mix. These solutions con-

tain about 5, 20, and 40 μ g of USP Narasin RS per mL. Using the designated percentage of narasin A in the USP Narasin RS, calculate the exact narasin A concentration, in μ g per mL, in each of the *Standard preparations*.

Assay preparation—Transfer about 5 g of Narasin Granular, accurately weighed, to a suitable container, add 200.0 mL of *Diluent*, and shake by mechanical means for 1 hour. Allow the solids to settle, and quantitatively dilute an accurately measured volume of the supernatant with *Diluent* to obtain a solution containing about 20 μ g of narasin per mL. Pass a portion of this solution through a filter having a 0.5- μ m or finer porosity, and use the filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 4.6-mm \times 25-cm column that contains packing L1. The column outlet is attached to a tee, the opposing arm is attached to a tube from which is pumped the *Derivatizing reagent*, and the outlet is connected to a 2-mL postcolumn reaction coil maintained at 98°. The outlet of the reaction coil is connected to a detector set at 520 nm. The *Mobile phase* and the *Derivatizing reagent* flow at the rate of about 0.7 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for monensin B, 0.75 for monensin A, 1.0 for narasin A, and 1.1 for narasin *D + I*; and the resolution, *R*, between the monensin B peak and the monensin A peak is not less than 1.25, and between the monensin A peak and the narasin A peak not less than 3.5. Chromatograph the *Standard preparations*, and record the peak responses as directed for *Procedure*: the tailing factor for the narasin A peak is not more than 1.4 when calculated by the formula:

$$W_{0.1} / 2f$$

in which $W_{0.1}$ is the width of the peak at 10% of peak height; and *f* is the distance from the peak maximum to the leading edge of the peak, the distance being measured at a point on the baseline at which 10% peak height is reached. The relative standard deviation for replicate injections is not more than 10%. [NOTE—After use, flush the system with methanol.]

Procedure—Separately inject equal volumes (about 200 μ L) of the *Standard preparations* and the *Assay preparation* into the chromatograph, and measure the areas of the peak responses for the narasin A and narasin *D + I* peaks [NOTE—Narasin D and narasin I will co-elute under this chromatographic system.]

Plot the three narasin peak responses in the chromatograms obtained from the *Standard preparations* versus the concentration, in μ g per mL, of narasin A, and draw the straight line best fitting the three plotted points. From the graph so obtained, and the narasin A peak response in the chromatogram obtained from the *Assay preparation*, determine the concentration, C_A , in μ g per mL, of narasin A in the *Assay preparation*. From the same graph and the narasin *D + I* peak response in the chromatogram obtained from the *Assay preparation*, determine the concentration, C_{D+I} , in μ g per mL, of narasin *D + I* in the *Assay preparation*. Calculate the biopotency, in mg per g, in the portion of Narasin Granular taken by the formula:

$$(0.001)(C_A F_A + C_{D+I} F_{D+I})(VE / M)$$

in which F_A is 1.077 representing the biopotency conversion factor for narasin A; F_{D+I} is the biopotency conversion factor for narasin *D + I*; *V* is the extraction volume, in mL; *E* is the dilution factor used in diluting the extract to the final estimated concentration of 20 μ g per mL; and *M* is the weight, in g, of Narasin Granular taken to prepare the *Assay preparation*.

ration. Calculate the bioconversion factor, F_{D+I} , for narasin D + I by the formula:

$$(1.510D + 0.012I) / (D + I)$$

in which D and I are the specified percentages of narasin D and narasin I, respectively, in USP Narasin RS; 1.510 is the factor for converting narasin D to narasin D biopotency; and 0.012 is the factor for converting narasin I to narasin I biopotency.

Narasin Premix

» Narasin Premix contains Narasin Granular mixed with suitable diluents and inactive ingredients. It contains not less than 90 percent and not more than 110 percent of the labeled amount of narasin.

Packaging and storage—Preserve in well-closed containers. Avoid moisture and excessive heat.

Labeling—Label it to indicate that it is for animal use only. The label bears the statement, "Do not feed undiluted."

USP Reference standards (11)—

USP Monensin Sodium RS

USP Narasin RS

Identification—The retention time of the major peak for narasin A in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 12% of its weight.

Assay—

Diluent, Mobile phase, Neutralized methanol, Derivatizing reagent, Resolution solution, Standard preparations, and Chromatographic system—Proceed as directed in the *Assay* under *Narasin Granular*.

Assay preparation—Transfer about 5 g of Narasin Premix, accurately weighed, to a suitable container, add 200.0 mL of *Diluent*, and shake by mechanical means for 1 hour. Allow the solids to settle, and quantitatively dilute an accurately measured volume of the supernatant with *Diluent* to obtain a solution containing about 20 µg of narasin per mL. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Narasin Granular*. Calculate the biopotency, in mg per g, in the portion of Narasin Premix taken by the formula:

$$(0.001)(C_A F_A + C_{D+I} F_{D+I})(VE / M)$$

in which M is the weight, in g, of Narasin Premix taken to prepare the *Assay preparation*; and the other terms are as defined therein.

Naratriptan Tablets

» Naratriptan Tablets contain an amount of Naratriptan Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of naratriptan ($C_{17}H_{25}N_3O_2S$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards (11)—

USP Naratriptan Hydrochloride RS

USP Naratriptan Resolution Mixture RS

A mixture of naratriptan hydrochloride with approximately 0.1% each of naratriptan related compound A [3-(1-methylpiperidin-4-yl)-1H-indole hydrochloride] and naratriptan related compound B [2-[3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indole-5-yl]ethanesulfonic acid methylamide oxalate].

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

Diluent—Prepare a mixture of methylene chloride and methanol (1:1).

Adsorbent: high performance thin-layer chromatographic silica gel.

Test solution—Transfer a number of Tablets, equivalent to 5 mg of naratriptan, to a 25-mL flask, add 1.0 mL of water to wet the Tablets, and gently shake to remove the Tablet film coating. Add 4.5 mL of *Diluent*, and shake for 5 minutes or until the Tablets have dispersed. Centrifuge at 3000 rpm for 10 minutes, and pass through a nylon filter having a 0.45-µm porosity.

Developing solvent system: a mixture of methylene chloride, alcohol, and triethylamine (10:2:1).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated.

Apparatus 1: 100 rpm.

Times: 15 minutes.

Procedure—Determine the amount of $C_{17}H_{25}N_3O_2S$ dissolved from the difference between first derivative absorbance values at the wavelengths of maximum and minimum in the range from 226 nm to 236 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard* solution having a known concentration of USP Naratriptan Hydrochloride RS in the same *Medium*. [NOTE—Do not sonicate the *Standard* solution to dissolve. Dissolve the USP Reference Standard with *Medium* at about 37°.]

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{17}H_{25}N_3O_2S$ is dissolved in 15 minutes.

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—

0.05 M Ammonium phosphate buffer and Resolution solution—Prepare as directed in the test for *Chromatographic purity* under *Naratriptan Hydrochloride*.

Solution A—Use filtered and degassed 0.05 M Ammonium phosphate buffer.

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Test solution—Transfer 5 Tablets into a suitable amber flask. Add 20.0 mL of 0.1 N sodium hydroxide, and allow to stand for 10 minutes. Sonicate for 10 minutes with regular vigorous swirling of the flask. Add 30.0 mL of 0.05 M Ammonium phosphate buffer, and mix well. Centrifuge a portion of this solution at 3500 rpm for about 10 minutes, and pass through a suitable filter having a 0.45-µm porosity, discarding the first 3 mL of the filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate

is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–35.0	97→80	3→20	linear gradient
35.0–40.0	80	20	isocratic
40.0–41.0	80→97	20→3	linear gradient
41.0–51.0	97	3	re-equilibration

Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.07 for 2-[3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide (naratriptan related compound B) and 1.0 for naratriptan; and the resolution, *R*, between naratriptan and naratriptan related compound B is not less than 1.5.

Procedure—Inject a volume (equivalent to about 5 µg of naratriptan hydrochloride) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all of the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i/F)/[r_N + \Sigma(r_i/F)]$$

in which *F* is the relative response factor (see the accompanying table for values) for each impurity; *r_i* is the peak response for each impurity; and *r_N* is the naratriptan peak response (see the accompanying table for limits). In addition to not exceeding the limits listed in the accompanying table, not more than 0.2% of any other individual impurity is found; and not more than 1.5% of total impurities is found.

Assay—

0.01 M Triethylamine phosphate buffer, Mobile phase, and Resolution solution—Prepare as directed in the Assay under Naratriptan Hydrochloride.

Standard preparation—Dissolve an accurately weighed quantity of USP Naratriptan Hydrochloride RS in 0.1 N sodium hydroxide to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute an accurately measured volume of this solution in 0.01 M Triethylamine phosphate buffer to obtain a solution having a known concentration of about 20 µg per mL.

Assay preparation—Transfer 5 Tablets into an amber 250-mL volumetric flask, add 30 mL of 0.1 N sodium hydroxide, and shake on a wrist-action shaker for at least 30 minutes. Sonicate for 10 minutes with regular vigorous swirling of the flask. Add about 170 mL of 0.01 M Triethylamine phosphate buffer, and mix well. Allow to cool to room temperature, dilute with 0.01 M Triethylamine phosphate buffer to volume, and mix. Centrifuge a portion of this solution at 3500 rpm for about 10 minutes, and pass through a suitable filter having a 0.45-µm porosity, discarding the first 3 mL of the filtrate.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 224-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L11. The flow rate is about 1.3 mL per minute. Chromato-

graph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for 3-(1-methylpiperidin-4-yl)-1H-indole (naratriptan related compound A), 1.0 for naratriptan, and 1.1 for naratriptan related compound B; and the resolution, *R*, between naratriptan related compound A and naratriptan and between naratriptan related compound B and naratriptan is not less than 1.5. Chromatograph the *Standard preparation*, record the chromatogram, and measure the peak response as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (equivalent to about 1 µg of naratriptan hydrochloride) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of naratriptan (C₁₇H₂₅N₃O₂S) in the portion of Tablets taken by the formula:

$$(335.47/371.93)100(C/D)(r_u/r_s)$$

in which 335.47 and 371.93 are the molecular weights of naratriptan and naratriptan hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Naratriptan Hydrochloride RS in the *Standard preparation*; *D* is the concentration, in mg per mL, of naratriptan in the *Assay preparation*, based upon the labeled quantity of naratriptan in the portion of Tablets taken and the extent of dilution; and *r_u* and *r_s* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Naratriptan Hydrochloride

C₁₇H₂₅N₃O₂S · HCl 371.93
1H-Indole-5-ethanesulfonamide, N-methyl-3-(1-methyl-4-piperidinyl)-, monohydrochloride.
N-Methyl-3-(1-methyl-4-piperidinyl)indole-5-ethanesulfonamide monohydrochloride
[143388-64-1].

» Naratriptan Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of C₁₇H₂₅N₃O₂S · HCl, calculated on the anhydrous and solvent free-basis.

Packaging and storage—Preserve in tight containers, and store below 30°.

Compound Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
2-[3-(1-Methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide	about 1.07	0.6	0.2
2,2-Bis-[3-(1-methylpiperidin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide	about 1.26	0.6	0.2
1-Methyl-4-[5-(2-methylsulfamoyl-ethyl)-1H-indol-3-yl]-pyridinium chloride	about 1.33	0.4	0.3
2-[3-(1-methylpiperidin-4-yl)-5-(2-methylsulfamoyl-ethyl)-indol-1-yl]ethanesulfonic acid methylamide	about 1.44	0.6	0.2
4-[1,5-Bis-(2-methylsulfamoyl-ethyl)-1H-indol-3-yl]-1-methylpyridinium chloride	about 1.62	0.5	0.2

USP Reference standards (11)—

USP Naratriptan Hydrochloride RS

USP Naratriptan Resolution Mixture RS

A mixture of naratriptan hydrochloride with approximately 0.1% each of naratriptan related compound A [3-(1-methylpiperidin-4-yl)-1H-indole hydrochloride] and naratriptan related compound B [2-[3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide oxalate].

NOTE—When performing assays and tests, store all standard, system suitability, and sample solutions in a cool place, protected from light.

Identification—

A: Infrared Absorption (197M).

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

C: It meets the requirements of the test for dry chlorides under Chloride (191).

Water Determination, Method I (921): not more than 0.5%.

Delete the following:

• **Heavy metals, Method II (231):** 0.002%. • (Official 1-Jan-2018)

Chromatographic purity—

0.05 M Ammonium phosphate buffer—Dissolve 5.75 g of monobasic ammonium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 3.00 ± 0.05 .

Solution A—Prepare a filtered and degassed mixture of 0.05 M Ammonium phosphate buffer and acetonitrile (97:3).

Solution B—Prepare a filtered and degassed mixture of 0.05 M Ammonium phosphate buffer and acetonitrile (4:1).

Mobile phase—Use variable mixtures of Solution A and Solution B as directed for Chromatographic system. Make adjustments if necessary (see System Suitability under Chromatography (621)).

Resolution solution—Dissolve an accurately weighed quantity of USP Naratriptan Resolution Mixture RS in water to obtain a solution having a known concentration of about 0.11 mg per mL.

Test solution—Dissolve an accurately weighed quantity of Naratriptan Hydrochloride in water to obtain a solution having a known concentration of about 0.11 mg per mL.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm \times 15-cm column that contains 4- μ m packing L1. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–35.0	100→0	0→100	linear gradient
35.0–40.0	0	100	isocratic
40.0–41.0	0→100	100→0	linear gradient
41.0–51.0	100	0	re-equilibration

Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 1.04 for 2-[3-(1-methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide (naratriptan related compound B) and 1.0 for naratriptan; and the resolution, R , between naratriptan and naratriptan related compound B is not less than 1.5.

Procedure—Inject a volume (about 20 μ L) of the Test solution into the chromatograph, record the chromatogram, and measure the areas for all of the peaks. Calculate the percentage of each impurity in the portion of Naratriptan Hydrochloride taken by the formula:

$$100(r_i/F)/[r_N + \Sigma(r_i/F)]$$

in which F is the relative response factor (see the accompanying table for values) for each impurity; r_i is the peak response for each impurity; and r_N is the naratriptan peak response (see the accompanying table for limits). In addition to not exceeding the limits listed in the accompanying table, not more than 0.1% of any other individual impurity is found; and not more than 1.5% of total impurities is found.

Assay—

0.01 M Triethylamine phosphate buffer—Dilute 0.6 mL of phosphoric acid with water to 900 mL, and adjust with triethylamine to a pH of 2.5.

Mobile phase—Prepare a filtered and degassed mixture of 0.01 M Triethylamine phosphate buffer and isopropyl alcohol (9:1). Make adjustments if necessary (see System Suitability under Chromatography (621)).

System suitability preparation—Dissolve an accurately weighed quantity of USP Naratriptan Resolution Mixture RS in Mobile phase to obtain a solution having a concentration of about 0.7 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Naratriptan Hydrochloride RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 0.11 mg per mL.

Assay preparation—Transfer about 11 mg of Naratriptan Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 282-nm detector and a 4.6-mm \times 15-cm column that contains 3- μ m packing

Compound Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
3-(1-Methylpiperidin-4-yl)-1H-indole	about 0.93	1.0	0.2
2-[3-(1-Methyl-1,2,3,6-tetrahydropyridin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide	about 1.04	0.6	0.1
2,2-Bis-[3-(1-methylpiperidin-4-yl)-1H-indol-5-yl]ethanesulfonic acid methylamide	about 1.18	0.6	0.2
1-Methyl-4-[5-(2-methylsulfamoyl-ethyl)-1H-indol-3-yl]-pyridinium chloride	about 1.25	0.4	0.2
2-[3-(1-Methylpiperidin-4-yl)-5-(2-methylsulfamoyl-ethyl)-indol-1-yl]ethanesulfonic acid methylamide	about 1.36	0.6	0.3
4-[1,5-Bis-(2-methylsulfamoyl-ethyl)-1H-indol-3-yl]-1-methylpyridinium chloride	about 1.44	0.5	0.1
2-[3-(1-Methylpiperidin-4-yl)-1H-indol-5-yl]ethane-sulfonic acid methyl-(2-methylsulfamoyl-ethyl)amide	about 1.48	1.0	0.2
5-Ethyl-3-(1-methylpiperidin-4-yl)-1H-indole	about 1.90	1.00	0.2

L11. The column temperature is maintained at 35°. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between naratriptan related compound A and naratriptan and between naratriptan related compound B and naratriptan is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%. [NOTE—For identification purposes, the approximate relative retention times are about 0.9 for naratriptan related compound A, 1.0 for naratriptan, and 1.1 for naratriptan related compound B.]

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{17}H_{25}N_3O_2S \cdot HCl$ in the portion of Naratriptan Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Naratriptan Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Naratriptan Compounded Oral Suspension

DEFINITION

Naratriptan Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of naratriptan ($C_{17}H_{25}N_3O_2S$). Prepare Naratriptan Compounded Oral Suspension containing 0.5 mg/mL of Naratriptan as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Naratriptan (as Naratriptan Hydrochloride)	50 mg (55.43 mg)
Vehicle: a 1:1 mixture of Vehicle for Oral Solution, NF (regular or sugar-free), and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number of tablets in a suitable mortar, and comminute the tablets to a fine powder or add Naratriptan Hydrochloride powder. Add the Vehicle in small portions and triturate to make a smooth paste. Add increasing volumes of the Vehicle to make a naratriptan suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the Vehicle to bring to final volume, and mix well.

ASSAY

PROCEDURE

Mobile phase: 2-Propanol and 12 mM triethylamine phosphate buffer (1:10). Make adjustments if necessary.

Standard stock solution: 0.5 mg/mL of USP Naratriptan Hydrochloride RS in *Mobile phase*

Standard solution: Transfer 1.0 mL of *Standard stock solution* to a 25-mL volumetric flask, dilute with *Mobile phase* to volume to obtain a solution containing 20 μ g/mL of naratriptan hydrochloride, and pass through a suitable filter of 0.22- μ m pore size.

Sample solution: Shake the Oral Suspension thoroughly by hand. Pipet 0.4 mL into a 10-mL volumetric flask. Add 1 mL of 0.1 N sodium hydroxide solution by

pipet, and sonicate for 5 min. Dilute with *Mobile phase* to volume, and mix to obtain a nominal concentration of 20 μ g/mL of naratriptan. Centrifuge, and pass the naratriptan solution through a suitable filter of 0.22- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L11

Flow rate: 1.4 mL/min

Injection volume: 25 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Retention time: 9.7 min for the naratriptan peak

Relative standard deviation: NMT 4.9% for the replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of naratriptan ($C_{17}H_{25}N_3O_2S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Naratriptan Hydrochloride RS in the *Standard solution* (μ g/mL), on the anhydrous basis

C_U = nominal concentration of naratriptan in the *Sample solution* (μ g/mL)

M_{r1} = molecular weight of naratriptan, 335.47

M_{r2} = molecular weight of naratriptan hydrochloride, 371.93

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- pH (791):** 4.0–4.5

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or in a refrigerator.
- BEYOND-USE DATE:** NMT 7 days after the date on which it was compounded when stored at controlled room temperature, and NMT 90 days after the date on which it was compounded when stored in a refrigerator
- LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- USP REFERENCE STANDARDS (11)**
USP Naratriptan Hydrochloride RS

Natamycin

$C_{33}H_{47}NO_{13}$ 665.73

Stereoisomer of 22-[(3-amino-3,6-dideoxy- β -D-mannopyranosyl)oxy]-1,3,26-trihydroxy-12-methyl-10-oxo-6,11,28-trioxatricyclo [22.3.1.0^{5,7}]octacos-8,14,16,18,20-pentaene-25-carboxylic acid [7681-93-8].

» Natamycin contains not less than 90.0 percent and not more than 102.0 percent of $C_{33}H_{47}NO_{13}$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Natamycin RS

Identification—Transfer 50 mg, accurately weighed, to a 200-mL volumetric flask, add 5.0 mL of water, and moisten the specimen. Add 100 mL of a 1 in 1000 solution of glacial acetic acid in methanol, and shake by mechanical means in the dark until dissolved. Dilute with the acetic acid-methanol solution to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with the acetic acid-methanol solution to volume, and mix: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Natamycin RS, concomitantly measured.

Crystallinity (695): meets the requirements.

pH (791): between 5.0 and 7.5, in an aqueous suspension containing 10 mg per mL.

Water Determination, Method I (921): between 6.0% and 9.0%.

Assay—[NOTE—Throughout the Assay, protect from direct light all solutions containing natamycin.]

Mobile phase—Dissolve 3.0 g of ammonium acetate and 1.0 g of ammonium chloride in 760 mL of water, and mix. Add 5.0 mL of tetrahydrofuran and 240 mL of acetonitrile, and mix. Pass this solution through a 0.5 μ m or finer porosity filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 20 mg of USP Natamycin RS, accurately weighed, to a 100-mL volumetric flask. Add 5.0 mL of tetrahydrofuran, and sonicate for 10 minutes. Add 60 mL of methanol, and swirl to dissolve. Add 25 mL of water, and mix. Allow to cool to room temperature. Dilute with water to volume, and mix. Pass this solution through a suitable membrane filter of 0.5 μ m or finer porosity.

Resolution solution—Dissolve 20 mg of Natamycin in a mixture of 99 mL of methanol and 1 mL of 0.1 N hydrochloric acid, and allow to stand for 2 hours. [NOTE—Use this solution within 1 hour.]

Assay preparation—Transfer about 20 mg of Natamycin, accurately weighed, to a 100-mL volumetric flask. Proceed as directed under *Standard preparation*, beginning with "add 5.0 mL of tetrahydrofuran."

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 303-nm detector and a 4.6-mm \times 25-cm analytical column that contains packing L1. [NOTE—A 3.9-mm \times 20-mm pre-column may be used to extend the useful life of the analytical column.] The flow rate is about 3 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 3000 theoretical plates, the tailing factor is not less than 0.8 and not more than 1.3, and the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between natamycin and its methyl ester is not less than 2.5. The relative retention times are about 0.7 for natamycin and 1.0 for its methyl ester.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the per-

centage of natamycin ($C_{33}H_{47}NO_{13}$) in the portion of Natamycin taken by the formula:

$$0.1(W_S P_S / W_U)(r_U / r_S)$$

in which W_S is the weight, in mg, of USP Natamycin RS taken to prepare the *Standard preparation*; P_S is the stated content, in μ g per mg, of USP Natamycin RS; W_U is the weight, in mg, of Natamycin taken to prepare the *Assay preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Natamycin Ophthalmic Suspension

» Natamycin Ophthalmic Suspension is a sterile suspension of Natamycin in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{33}H_{47}NO_{13}$. It contains one or more suitable preservatives.

Packaging and storage—Preserve in tight, light-resistant containers. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Natamycin RS

Identification—Transfer a volume of Ophthalmic Suspension, equivalent to about 50 mg of natamycin, to a 200-mL volumetric flask, and add water to make a volume of 5 mL. Proceed as directed in the *Identification* test under *Natamycin*, beginning with "Add 100 mL of a 1 in 1000 solution of glacial acetic acid in methanol:" the specified result is obtained.

Sterility Tests (71)—It meets the requirements as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, using 0.25 mL of the Ophthalmic Suspension taken from each container.

pH (791): between 5.0 and 7.5.

Assay—[NOTE—Throughout the Assay protect from direct light all solutions containing natamycin.]

Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the Assay under *Natamycin*.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, equivalent to about 50 mg of natamycin, to a 250-mL volumetric flask. Add 12.5 mL of tetrahydrofuran, and sonicate for 10 minutes. Add 150 mL of methanol, and swirl to dissolve. Add 60 mL of water, and mix. Allow to cool to room temperature. Dilute with water to volume, and mix. Filter this solution through a suitable membrane filter of 0.5- μ m or finer porosity.

Procedure—Proceed as directed in the Assay under *Natamycin*. Calculate the quantity, in mg, of $C_{33}H_{47}NO_{13}$ in each mL of the Ophthalmic Suspension taken by the formula:

$$0.25C(P_S / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Natamycin RS in the *Standard preparation*; P_S is the stated content, in μ g per mg, of USP Natamycin RS; V is the volume, in mL, of Ophthalmic Suspension taken, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nateglinide

$C_{19}H_{27}NO_3$ 317.42
D-Phenylalanine, N-[[trans-4-(1-methylethyl)cyclohexyl]carbonyl]-;
(-)-N-[[trans-4-Isopropylcyclohexyl]carbonyl]-D-phenylalanine
[105816-04-4].

DEFINITION

Nateglinide contains NLT 98.0% and NMT 102.0% of $C_{19}H_{27}NO_3$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 8.5 g/L of anhydrous dibasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 7.5.

Mobile phase: Methanol and *Buffer* (1:1)

System suitability stock solution: 0.2 mg/mL each of USP Nateglinide Related Compound C RS and DL-phenylalanine in methanol. [NOTE—Sonicate, if necessary.]

System suitability solution: Transfer USP Nateglinide RS to a suitable volumetric flask, dissolve first in methanol, using 45% of the final volume, add *System suitability stock solution* equal to 5% of the final volume, and then dilute with *Buffer* to volume to obtain a solution containing about 1.0 mg/mL of nateglinide and about 0.01 mg/mL each of nateglinide related compound C and DL-phenylalanine.

Standard solution: 1.0 mg/mL of nateglinide prepared as follows: transfer USP Nateglinide RS to a suitable volumetric flask, dissolve first in methanol, using 50% of the final volume, and then dilute with *Buffer* to volume.

Sample solution: Transfer about 100 mg of Nateglinide to a 100-mL volumetric flask, dissolve in 50 mL of methanol, and dilute with *Buffer* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 6-mm × 15-cm; 6-μm packing L71 (see *Chromatographic Reagents under Reagents, Indicators, and Solutions*)

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 0.9 between nateglinide related compound C and nateglinide, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of nateglinide ($C_{19}H_{27}NO_3$) in the portion of Nateglinide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Nateglinide RS in the *Standard solution* (mg/mL)
 C_U = concentration of Nateglinide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II (231):** NMT 10 ppm • (Official 1-Jan-2018)

• LIMIT OF NATEGLINIDE RELATED COMPOUND A AND OTHER IMPURITIES

Buffer: 7.8 g/L of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Buffer* (7:13)

System suitability stock solution: Dissolve USP Nateglinide Related Compound A RS in acetonitrile to obtain a solution containing about 0.6 mg/mL. Further dilute this solution with *Mobile phase* to obtain a solution containing about 0.12 mg/mL.

System suitability solution: Transfer an amount of USP Nateglinide RS to a suitable volumetric flask, dissolve first in acetonitrile using 10% of the final volume, then add *System suitability stock solution* equal to 10% of the final volume, and dilute with *Mobile phase* to volume to obtain a solution containing about 6 mg/mL of nateglinide and about 0.012 mg/mL of nateglinide related compound A.

Standard solution: Dissolve USP Nateglinide RS in acetonitrile to obtain a solution having a known concentration of about 0.3 mg/mL. Further dilute this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.06 mg/mL.

Sample solution: Transfer 60 mg of Nateglinide to a 10-mL volumetric flask, dissolve in a minimal amount of acetonitrile, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 5-cm; 5-μm packing L7

Column temperature: 40°

Flow rate: 2 mL/min

Injection size: 100 μL

Run time: 5 times the retention time of nateglinide

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.5 between nateglinide related compound A and nateglinide, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Nateglinide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*
 r_S = peak response of nateglinide from the *Standard solution*
 C_S = concentration of USP Nateglinide RS in the *Standard solution* (mg/mL)
 C_U = concentration of Nateglinide in the *Sample solution* (mg/mL)

F = relative response factor (see Table 1)
 Acceptance criteria
 Individual impurities: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Nateglinide related compound A ^a	0.5	0.015	0.2
Ethyl analog ^b	0.6	1.0	0.1
Nateglinide	1.0	—	—
IPP impurity ^c	3.1	1.0	0.1
Ester impurity ^d	4.1	0.94	0.1
Any other individual impurity	—	1.0	0.1

^a *trans*-4-Isopropylcyclohexylcarboxylic acid.

^b *N*-(*trans*-4-Ethylcyclohexylcarbonyl)-D-phenylalanine.

^c *N*-(*trans*-4-Isopropylcyclohexylcarbonyl)-D-phenylalanine-D-phenylalanine.

^d *N*-(*trans*-4-isopropylcyclohexylcarbonyl)-D-phenylalanine-ethyl ester.

• LIMIT OF NATEGLINIDE RELATED COMPOUND B

Mobile phase: 0.77 g/L of ammonium acetate in methanol.

[NOTE—The following solutions are stable for up to 48 h when stored in a refrigerator.]

System suitability solution: 10 mg/mL of USP Nateglinide RS and 0.02 mg/mL of USP Nateglinide Related Compound B RS in methanol

Standard solution: 0.02 mg/mL of USP Nateglinide Related Compound B RS in methanol. [NOTE—Nateglinide related compound B is *N*-(*trans*-4-isopropyl-cyclohexyl-carbonyl)-L-phenylalanine.]

Sample solution: 10 mg/mL of Nateglinide in methanol

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 220 nm

Column: 4-mm × 25-cm or 4.6-mm × 25-cm; 5-μm packing L72 (see Chromatographic Reagents under Reagents, Indicators, and Solutions)

Column temperature: 40°

Flow rate: 0.8 mL/min. [NOTE—The flow rate can be adjusted as needed to achieve a recommended retention time of nateglinide related compound B at about 25 min.]

Injection size: 10 μL

System suitability

[NOTE—The elution order is nateglinide related compound B, followed by the nateglinide peak.]

Samples: System suitability solution and Standard solution

Suitability requirements

Resolution: NLT 0.8 between nateglinide related compound B and nateglinide, System suitability solution

Relative standard deviation: NMT 5%, Standard solution

Analysis

Samples: Standard solution and Sample solution
 Calculate the percentage of nateglinide related compound B in the portion of Nateglinide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nateglinide related compound B from the Sample solution

r_S = peak response of nateglinide related compound B from the Standard solution

C_S = concentration of USP Nateglinide Related Compound B RS in the Standard solution (mg/mL)

C_U = concentration of Nateglinide in the Sample solution (mg/mL)

Acceptance criteria: NMT 0.2%

• LIMIT OF NATEGLINIDE RELATED COMPOUND C AND PHENYLALANINE

Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Diluted standard solution: Dilute the Standard solution with Mobile phase to obtain a solution having a known concentration of about 0.01 mg/mL of nateglinide.

Analysis

Samples: Sample solution and Diluted standard solution

Calculate the percentage of each specified impurity listed in Table 2 in the portion of Nateglinide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the Sample solution

r_S = peak response of nateglinide from the Diluted standard solution

C_S = concentration of nateglinide in the Diluted standard solution (mg/mL)

C_U = concentration of Nateglinide in the Sample solution (mg/mL)

F = relative response factor of each individual impurity (see Table 2)

Acceptance criteria

Individual impurities: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Phenylalanine	0.2	1.5	0.2
Nateglinide <i>cis</i> -isomer ^a (related compound C)	0.9	0.97	0.2
Nateglinide	1.0	—	—

^a *N*-(*cis*-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

Total impurities: The sum of all impurities found in the tests for Limit of Nateglinide Related Compound A and Other Impurities, Limit of Nateglinide Related Compound B, and Limit of Nateglinide Related Compound C and Phenylalanine is NMT 0.5%.

SPECIFIC TESTS

- **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.

• USP REFERENCE STANDARDS (11)

Nateglinide Tablets

DEFINITION

Nateglinide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of nateglinide ($C_{19}H_{27}NO_3$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Diluent: Acetonitrile and water (11:9)

Mobile phase: Acetonitrile and 0.05% solution of trifluoroacetic acid (23:27)

Standard solution: 0.72 mg/mL of USP Nateglinide RS prepared as follows. Transfer USP Nateglinide RS to a suitable volumetric flask, and add acetonitrile to 40% of the volume of the flask. [NOTE—Sonicate to dissolve.] Add water equivalent to 30% of the final volume, mix, cool the solution to room temperature, and dilute with *Diluent* to volume.

Sample solution: Place 20 Tablets into a 500-mL volumetric flask, and add 60 mL of water to disintegrate the Tablets. [NOTE—Sonicate with cooling, if necessary.] Add 280 mL of acetonitrile, and shake by mechanical means for at least 30 min. Dilute with *Diluent* to volume. Pass a portion through a 0.45- μ m glass microfiber filter, discarding the first 10 mL of the filtrate, or use centrifugation to obtain a clear solution. Dilute an aliquot of this solution with *Diluent* to obtain a solution having a concentration of 0.72 mg/mL based on the label claim.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled quantity of $C_{19}H_{27}NO_3$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: 0.01 N hydrochloric acid containing 0.5% (w/v) of sodium lauryl sulfate; 1000 mL

Apparatus 2: 50 rpm

Time: 30 min

Determine the quantity of $C_{19}H_{27}NO_3$ dissolved by employing the following method.

Solution A: 6.9 mg/mL of monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Solution A* (45:55)

Standard stock solution: 0.3 mg/mL of USP Nateglinide RS prepared as follows. Transfer USP Nateglinide

RS to a suitable volumetric flask, dissolve in a small volume of acetonitrile not exceeding 5% of the final volume, and dilute with *Medium* to volume.

Standard solution: 0.12 mg/mL of USP Nateglinide RS in *Medium*, from the *Standard stock solution*

Sample solution: Pass through a suitable filter with pore size of 0.7 μ m.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 5-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{19}H_{27}NO_3$ dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V) \times (100/L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

V = volume of *Medium*, 1000 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of $C_{19}H_{27}NO_3$ is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
USP Nateglinide RS

Nefazodone Hydrochloride

$C_{25}H_{32}ClN_5O_2 \cdot HCl$

506.47

3H-1,2,4-Triazol-3-one, 2-[3-[4-(3-chlorophenyl)-1-piperazinyl]propyl]-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-, monohydrochloride;

1-[3-[4-(*m*-Chlorophenyl)-1-piperazinyl]propyl]-3-ethyl-4-(2-phenoxyethyl)- Δ^2 -1,2,4-triazolin-5-one monohydrochloride [82752-99-6].

DEFINITION

Nefazodone Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{25}H_{32}ClN_5O_2 \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (197K)**

- B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

Sample solution: 10 mg/mL in methanol

ASSAY

PROCEDURE

Sample solution: 800 mg of Nefazodone Hydrochloride in 50 mL of glacial acetic acid. Add 15 mL of 3% mercuric acetate in glacial acetic acid.

Titrimetric system

(See *Titrimetry* (541).)

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis

Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Carry out a blank titration.

Calculate the percentage of $C_{25}H_{32}ClN_5O_2 \cdot HCl$ in the portion of Nefazodone Hydrochloride taken:

$$\text{Result} = ((V - B) \times N \times F/W) \times 100$$

V = sample titrant volume (mL)

B = blank titrant volume (mL)

N = titrant normality (mEq/mL)

F = 506.5 (mg/mEq)

W = sample weight (mg)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Injection size: 10 µL

System suitability

Samples: System suitability solution and Standard solution

Suitability requirements

Resolution: NLT 4.0 between nefazodone related compound A and nefazodone hydrochloride; NLT 1.5 between nefazodone hydrochloride and nefazodone related compound B, *System suitability solution*

Relative standard deviation: NMT 5.0% for nefazodone related compound A and nefazodone related compound B, *Standard solution*

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each nefazodone related compound in the portion of Nefazodone Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of the corresponding nefazodone related compound from the *Sample solution*

r_s = peak area of the corresponding nefazodone related compound from the *Standard solution*

C_s = concentration of the relevant USP RS in the *Standard solution* (mg/mL)

C_u = concentration of the *Sample solution* (mg/mL)

[NOTE—Use the peak area for nefazodone hydrochloride in the *Standard solution* as r_s to calculate any unknown impurity.]

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 0.5%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Nefazodone related compound A	1.2	0.2
Nefazodone related compound B	0.94	0.2
Nefazodone	1.0	—
Any other individual, unidentified impurity	—	0.1

SPECIFIC TESTS

• **LOSS ON DRYING** (731): Dry a sample in a vacuum at 105° for 3 h; it loses NMT 0.5% of its weight.

• **COMPLETENESS OF SOLUTION** (641): Meets the requirements

Sample solution: 25 mg/mL in methanol

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE**: Preserve in tight containers. Store between 15° and 30°.

• **USP REFERENCE STANDARDS** (11)

USP Nefazodone Hydrochloride RS

USP Nefazodone Related Compound A RS

1-(3-Chloropropyl)-4-(chlorophenyl)piperazine.

$C_{13}H_{18}Cl_2N_2$ 273.20

USP Nefazodone Related Compound B RS

2-(3-(4-(Chlorophenyl)-1-piperazinyl)propyl)-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-3H-1,2,4-triazol-3-one.

$C_{25}H_{32}ClN_5O_2$ 470.01

Nefazodone Hydrochloride Tablets

» Nefazodone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$).

Packaging and storage—Preserve in tight containers. Store at controlled room temperature.

USP Reference standards (11)—

USP Nefazodone Hydrochloride RS

USP Nefazodone Related Compound A RS

1-(3-Chloropropyl)-4-(chlorophenyl)piperazine.

$C_{13}H_{18}Cl_2N_2$ 273.20

USP Nefazodone Related Compound B RS

2-(3-(4-(Chlorophenyl)-1-piperazinyl)propyl)-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-3H-1,2,4-triazol-3-one.

$C_{25}H_{32}ClN_5O_2$ 470.01

Identification—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Standard stock solution—Transfer about 70 mg of USP Nefazodone Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask. Add 2.5 mL of methanol, dilute with Medium to volume, and mix.

Standard solution—Dilute the Standard stock solution with Medium in such a way that the final concentration is similar to the one expected in the Test solution.

Test solution—Use portions of the solution under test passed through a 0.45- μ m PVDF filter, discarding the first 5 mL.

Procedure—Determine the percentage of the labeled amount of nefazodone hydrochloride dissolved by employing UV absorption, using a suitable spectrophotometer, at the wavelength of maximum absorbance at about 246 nm, on the Test solution in comparison with the Standard solution, using Medium as the blank. Calculate the percentage of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$) dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the Test solution and the Standard solution, respectively; C_S is the concentration, in mg per mL, of USP Nefazodone Hydrochloride RS in the Standard solution; 900 is the volume, in mL, of Medium; 100 is the conversion factor to percentage; and LC is the tablet label claim, in mg.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{25}H_{32}ClN_5O_2 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Related compounds—

Dilute acetic acid, Buffer solution, and Mobile phase—Proceed as directed in the Assay.

Nefazodone related compound A stock solution—Prepare a solution of USP Nefazodone Related Compound A RS in Mobile phase having a known concentration of about 80 μ g per mL.

Nefazodone related compound B stock solution—Prepare a solution of USP Nefazodone Related Compound B RS in Mobile phase having a known concentration of about 80 μ g per mL.

System suitability solution—Transfer about 10 mg of USP Nefazodone Hydrochloride RS into a 10-mL volumetric flask. Add 2.0 mL of Nefazodone related compound A stock solution and 2.0 mL of Nefazodone related compound B stock solution, and mix to dissolve the nefazodone hydrochloride. Dilute with Mobile phase to volume, and mix.

Standard solution—Use the Standard preparation, prepared as directed in the Assay.

Test solution—Use the Assay stock preparation, prepared as directed in the Assay.

Chromatographic system—Prepare as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure. Identify the peaks using the relative retention times given in Table 1: the resolution, R , between nefazodone related compound A and nefazodone hydrochloride is not less than 2.0; and the resolution, R , between nefazodone related compound B and nefazodone hydrochloride is not less than 1.5. [NOTE—Approximate relative retention times are provided in Table 1 for informational purposes only.]

Procedure—Inject equal volumes (about 10 μ L) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of individual nefazodone related compounds in the portion of Tablets taken by the formula:

$$100(r_U / r_S)(C_S / C_T)(1/F)$$

in which r_U is the individual peak response for each nefazodone related compound obtained from the Test solution; r_S is the response of the corresponding peak in the Standard solution, respectively; C_S and C_T are the concentrations, in mg per mL, of nefazodone hydrochloride in the Standard solution and the Test solution, respectively; and F is the relative response factor obtained from Table 1. The related compound requirements are listed in Table 1.

Table 1

Related Compound	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Nefazodone related compound A	1.4	1.2	0.2
Nefazodone related compound B	0.9	1.0	0.2
Any individual unknown impurity	—	1.0	0.2 each
Total known and unknown	—	—	0.5

Assay—

Dilute acetic acid—Prepare a mixture of acetic acid and water (1:1).

Buffer solution—Dissolve 0.77 g of ammonium acetate in 1 L of water. Add 1.0 mL of triethylamine, and mix well. Adjust with Dilute acetic acid to a pH of 7.10 ± 0.05 , and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and Buffer solution (58:42). Make adjustments if necessary (see System Suitability under Chromatography (621)).

Standard preparation—Prepare a solution of USP Nefazodone Hydrochloride RS in Mobile phase having a known concentration of about 0.1 mg per mL.

Assay stock preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed por-

tion of the powder, equivalent to about 250 mg of nefazodone hydrochloride, based on the label claim, to a 250-mL volumetric flask, add about 125 mL of *Mobile phase*, and sonicate for about 10 minutes with occasional shaking. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a concentration of about 1 mg per mL of nefazodone hydrochloride. Pass a portion of this solution through a filter having a 0.45- μ m or finer porosity, and use the filtrate, which has a concentration of about 1 mg per mL of nefazodone hydrochloride.

Assay preparation—Transfer 5.0 mL of *Assay stock preparation* into a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix to obtain a solution having a concentration of 0.1 mg per mL of nefazodone hydrochloride.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm \times 25-cm column containing 5- μ m L1 packing. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Inject the *Standard preparation*, and record the peak responses as directed for *Procedure*; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percent of label claim, of nefazodone hydrochloride ($C_{25}H_{32}ClN_5O_2 \cdot HCl$) in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of nefazodone hydrochloride in the *Standard preparation* and the *Assay preparation*, respectively; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin for Injection

» Neomycin for Injection contains an amount of Neomycin Sulfate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of neomycin.

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

USP Reference standards (11)—

USP Endotoxin RS
USP Neomycin Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Bacterial Endotoxins Test (85)—It contains not more than 1.30 USP Endotoxin Units per mg of neomycin.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

Other requirements—It meets the requirements for *pH and Loss on drying under Neomycin Sulfate* and for *Uniformity of Dosage Units* (905) and *Labeling* (7), *Labels and Labeling for Injectable Products*.

Change to read:

Assay—

Assay preparation 1 (where it is packaged for dispensing)—Constitute Neomycin for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Buffer B.3* (CN 1-May-2017) to obtain a solution having a convenient concentration.

Assay preparation 2 (where it is packaged for dispensing and where the labeling states the quantity of neomycin in a given volume of constituted solution)—Constitute Neomycin for Injection as directed in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Buffer B.3* (CN 1-May-2017) to obtain a solution having a convenient concentration.

Procedure—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Neomycin Boluses

» Neomycin Boluses contain an amount of Neomycin Sulfate equivalent to not less than 90.0 percent and not more than 125.0 percent of the labeled amount of neomycin.

Packaging and storage—Preserve in tight containers.

Labeling—Label Boluses to indicate that they are for veterinary use only.

USP Reference standards (11)—

USP Neomycin Sulfate RS

Identification—Blend a Bolus with 250 mL of water. Filter a portion of the suspension obtained. If necessary, dilute a portion of the filtrate with water to obtain a test solution containing about 2 mg of neomycin per mL. Dissolve a quantity of USP Neomycin Sulfate RS in water to obtain a Standard solution containing about 2 mg of neomycin per mL. Separately apply 1 μ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of water, butyl alcohol, glacial acetic acid, and pyridine (35:30:22:6) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry at about 110° for about 5 minutes. Spray the plate evenly with a solution of ninhydrin (2 mg per mL), and dry the plate at about 100° for about 5 minutes. Locate the spots on the plate: the R_f value of the principal spot in the chromatogram obtained from the test solution corresponds to that of the principal spot in the chromatogram obtained from the Standard solution.

Uniformity of dosage units (905): meet the requirements for *Weight Variation*.

Disintegration (701): 60 minutes.

Change to read:

Assay—Proceed as directed for the assay of neomycin under *Antibiotics—Microbial Assays* (81), the *Test Dilution* being prepared as follows. Blend an accurately counted number of Boluses (not less than 2) at high speed in a blender jar with a sufficient accurately measured volume of *Buffer*

B.3. (CN 1-May-2017) to obtain a stock solution having a convenient concentration. Dilute this stock solution quantitatively and stepwise with **Buffer B.3.** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Neomycin Sulfate

Neomycin sulfate.
Neomycins sulfate [1405-10-3].

» Neomycin Sulfate is the sulfate salt of a kind of neomycin, an antibacterial substance produced by the growth of *Streptomyces fradiae* Waksman (Fam. Streptomycetaceae), or a mixture of two or more such salts. It has a potency equivalent to not less than 600 µg of neomycin per mg, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—Where it is intended for use in preparing injectable or other sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or other sterile dosage forms.

USP Reference standards (11)—

USP Endotoxin RS
USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: Dissolve about 10 mg in 1 mL of water, add 5 mL of 15 N sulfuric acid, and heat at 100° for 100 minutes. Allow to cool, add 10 mL of xylene, and shake for 10 minutes. Allow to separate, and decant the xylene layer. To the xylene layer add 10 mL of *p*-bromoaniline TS, and shake: a vivid pink-red color develops upon standing.

C: A solution (1 in 20) responds to the tests for *Sulfate* (191).

pH (791): between 5.0 and 7.5, in a solution containing 33 mg of neomycin per mL.

Loss on drying (731)—Dry about 100 mg in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 8.0% of its weight.

Other requirements—Where the label states that Neomycin Sulfate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Neomycin for Injection*. Where the label states that Neomycin Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Neomycin for Injection*. Where it is intended for use in preparing nonparenteral sterile dosage forms, it is exempt from the requirements for *Bacterial endotoxins*.

Assay—Proceed with Neomycin Sulfate as directed under *Antibiotics—Microbial Assays* (81).

Neomycin Sulfate Cream

» Neomycin Sulfate Cream contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin.

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Neomycin Sulfate RS

Thin-layer chromatographic identification test

(201BNP): meets the requirements.

Minimum fill (755): meets the requirements.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Cream, equivalent to about 1.75 mg of neomycin, shaken in a separator with about 50 mL of ether, and extracted with four 20-mL portions of **Buffer B.3.** (CN 1-May-2017). Combine the aqueous extracts, and dilute with **Buffer B.3.** (CN 1-May-2017) to an appropriate volume to obtain a stock solution of convenient concentration. Dilute this stock solution quantitatively and stepwise with **Buffer B.3.** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Neomycin Sulfate Ointment

» Neomycin Sulfate Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin.

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Neomycin Sulfate RS

Thin-layer chromatographic identification test

(201BNP): meets the requirements.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment, equivalent to about 3.5 mg of neomycin, shaken in a separator with about 50 mL of ether, and extracted with four 20-mL portions of **Buffer B.3.** (CN 1-May-2017). Combine the aqueous extracts, and dilute with **Buffer B.3.** (CN 1-May-2017) to an appropriate volume to obtain a stock solution of convenient concentration. Dilute this stock solution quantitatively and stepwise with **Buffer B.3.** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Neomycin Sulfate Ophthalmic Ointment

DEFINITION

Neomycin Sulfate Ophthalmic Ointment is a sterile preparation of Neomycin Sulfate in a suitable ointment base. It contains the equivalent of NLT 90.0% and NMT 135.0% of the labeled amount of neomycin.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201BNP): Meets the requirements

ASSAY• **PROCEDURE**

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of the Ophthalmic Ointment containing nominally 3.5 mg of neomycin in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–135.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements in *Ophthalmic Products—Quality Tests* (771).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes.
- **USP REFERENCE STANDARDS** (11)
USP Neomycin Sulfate RS

Neomycin Sulfate Oral Solution

» Neomycin Sulfate Oral Solution contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of neomycin. It may contain one or more suitable colors, flavors, and preservatives.

Packaging and storage—Preserve in tight, light-resistant containers, preferably at controlled room temperature.

USP Reference standards (11)—
USP Neomycin Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

pH (791): between 5.0 and 7.5.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Oral Solution quantitatively diluted with *Buffer B.3* (CN 1-May-2017) to yield a solution having a convenient concentration of neomycin. Quantitatively dilute this stock solution with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Neomycin Sulfate Tablets

» Neomycin Sulfate Tablets contain the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of neomycin.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—
USP Neomycin Sulfate RS

Thin-layer chromatographic identification test (201BNP)—

*Test solution—*Shake a portion of ground Tablet powder, equivalent to about 70 mg of neomycin (base), with 5 mL of water, and filter. Dilute a portion of this solution with 0.1 N hydrochloric acid to obtain a solution containing the equivalent of 3.5 mg of neomycin (base) per mL. It meets the requirements.

Disintegration (701): 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Loss on drying (731)—Dry about 100 mg of powdered Tablets, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 10.0% of its weight.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), using not less than 5 Tablets blended at high-speed in a blender jar for 3 to 5 minutes with a sufficient accurately measured volume of *Buffer B.3* (CN 1-May-2017) to obtain a stock solution having a convenient concentration. Dilute this stock solution quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Neomycin Sulfate and Bacitracin Ointment

» Neomycin Sulfate and Bacitracin Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and bacitracin.

Packaging and storage—Preserve in tight, light-resistant containers, preferably at controlled room temperature.

USP Reference standards (11)—
USP Bacitracin Zinc RS
USP Neomycin Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin—Proceed with Ointment as directed in the Assay under *Neomycin Sulfate Ointment*.

Assay for bacitracin—Proceed with Ointment as directed in the Assay under *Bacitracin Ointment*.

Neomycin Sulfate and Bacitracin Zinc Ointment

» Neomycin Sulfate and Bacitracin Zinc Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and bacitracin.

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.

USP Reference standards (11)—

USP Bacitracin Zinc RS

USP Neomycin Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin and Assay for bacitracin—Proceed with Ointment as directed in the Assay for neomycin and in the Assay for bacitracin under Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment.

Neomycin Sulfate and Dexamethasone Sodium Phosphate Cream

DEFINITION

Neomycin Sulfate and Dexamethasone Sodium Phosphate Cream contains the equivalent of NLT 90.0% and NMT 135.0% of the labeled amount of neomycin, and the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of dexamethasone phosphate ($C_{22}H_{30}FO_8P$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201BNP): Meets the requirements for neomycin
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Dexamethasone Phosphate.

ASSAY

• NEOMYCIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Cream, containing nominally 1.75 mg of neomycin, with 50 mL of ether, and extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* with a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–135.0%

• DEXAMETHASONE PHOSPHATE

Solution A: 6.9 g/L of monobasic sodium phosphate

Mobile phase: Methanol and *Solution A* (52:48)

Diluent: Dissolve 0.29 g of dibasic sodium phosphate in 450 mL of water, and add 550 mL of alcohol.

Standard solution: 33 µg/mL of USP Dexamethasone Sodium Phosphate RS in *Diluent*. Prepare this solution freshly.

Sample solution: Nominally 30 µg/mL of dexamethasone phosphate from Cream in *Diluent*, prepared as follows. Transfer a portion of Cream, containing nominally 3 mg of dexamethasone phosphate, to a suitable beaker. Add 65 mL of *Diluent*, and heat just to

boiling. Pour the contents of the beaker into a separatory funnel containing 45 mL of isooctane. After shaking for 1 min, decant the lower layer into a 100-mL volumetric flask. Rinse the beaker with two 15-mL portions of *Diluent*, add each to the separatory funnel, shake, and decant the lower layer from each extraction into the 100-mL volumetric flask. Dilute with *Diluent* to volume, and mix. Pass through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for dexamethasone phosphate is about 8.5 min.]

Suitability requirements

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dexamethasone phosphate ($C_{22}H_{30}FO_8P$) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Dexamethasone Sodium Phosphate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of dexamethasone phosphate in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of dexamethasone phosphate, 472.44

M_{r2} = molecular weight of dexamethasone sodium phosphate, 516.40

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **MINIMUM FILL** (755): Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Dexamethasone Sodium Phosphate RS
USP Neomycin Sulfate RS

Neomycin Sulfate and Dexamethasone Sodium Phosphate Ophthalmic Ointment

DEFINITION

Neomycin Sulfate and Dexamethasone Sodium Phosphate Ophthalmic Ointment is a sterile ointment containing Neomycin Sulfate and Dexamethasone Sodium Phosphate. It contains the equivalent of NLT 90.0% and NMT 135.0% of the labeled amount of neomycin, and the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of dexamethasone phosphate ($C_{22}H_{30}FO_8P$).

[NOTE—Where Neomycin Sulfate and Dexamethasone Sodium Phosphate Ophthalmic Ointment is prescribed without reference to the quantity of neomycin or dexamethasone phosphate contained therein, a product containing 3.5 mg of neomycin and 0.5 mg of dexamethasone phosphate per g shall be dispensed.]

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201BNP):** Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Dexamethasone Phosphate*.

ASSAY• **NEOMYCIN**

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a weighed portion of Ophthalmic Ointment in a separator with about 50 mL of ether, and extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–135.0%

• **DEXAMETHASONE PHOSPHATE**

Buffer: 6.9 g/L of monobasic sodium phosphate

Mobile phase: Methanol and *Buffer* (52:48)

Diluent: Dissolve 0.29 g of dibasic sodium phosphate in 450 mL of water, and add 550 mL of alcohol.

Standard solution: 33 µg/mL of USP Dexamethasone Sodium Phosphate RS in *Diluent*. Prepare this solution freshly.

Sample solution: Nominally 30 µg/mL of dexamethasone phosphate, prepared as follows. Transfer a portion of Ophthalmic Ointment containing nominally 3 mg of dexamethasone phosphate to a suitable beaker. Add 65 mL of *Diluent*, and heat just to boiling. Pour the contents of the beaker into a separator containing 45 mL of isooctane. After shaking for 1 min, decant the lower layer into a 100-mL volumetric flask. Rinse the beaker with two 15-mL portions of *Diluent*, extracting the remaining isooctane in the separator with each portion, and decanting the lower layer from each extraction into the 100-mL volumetric flask. Dilute with *Diluent* to volume, and mix. Pass through a suitable filter.

Neomycin Sulfate and Dexamethasone Sodium Phosphate Ophthalmic Solution

DEFINITION

Neomycin Sulfate and Dexamethasone Sodium Phosphate Ophthalmic Solution is a sterile, aqueous solution of Neomycin Sulfate and Dexamethasone Sodium Phosphate. It contains the equivalent of NLT 90.0% and NMT 130.0% of the labeled amount of neomycin, and the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of dexamethasone phosphate ($C_{22}H_{30}FO_8P$). It may contain one or more suitable buffers, dispersants, and preservatives.

[NOTE—Where Neomycin Sulfate and Dexamethasone Sodium Phosphate Ophthalmic Solution is prescribed, without reference to the amount of neomycin or dexamethasone phosphate contained therein, a product containing 3.5 mg/mL of neomycin and 1.0 mg/mL of dexamethasone phosphate shall be dispensed.]

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201BNP):** Meets the requirements for neomycin
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Dexamethasone Phosphate*.

ASSAY• **NEOMYCIN**

(See *Antibiotics—Microbial Assays* (81).)

Analysis: Dilute an aliquot of Ophthalmic Solution with *Buffer B.3* to obtain a *Test Dilution* with a neomycin concentration that is nominally equivalent to the median level of the standard (1.0 µg/mL).

Acceptance criteria: 90.0%–130.0%

• **DEXAMETHASONE PHOSPHATE**

Solution A: 0.29 g/L of dibasic sodium phosphate

Solution B: 13.80 g/L of monobasic sodium phosphate

Mobile phase: Acetonitrile and *Solution B* (31:69)

Standard solution: 27 µg/mL of USP Dexamethasone Sodium Phosphate RS in *Solution A*. Pass through a filter of 1-µm or finer pore size.

Sample solution: Nominally 25 µg/mL of dexamethasone phosphate from Ophthalmic Solution in *Solution A* prepared as follows. Slowly dilute a portion of Ophthalmic Solution with *Solution A* to volume, mix, and pass through a suitable filter of 1-µm or finer pore size.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 3.9-mm × 30-cm; 10-μm packing L1**Flow rate:** 1.3 mL/min**Injection volume:** 50 μL**System suitability****Sample:** *Standard solution*

Neomycin Sulfate and Fluocinolone Acetonide Cream

» Neomycin Sulfate and Fluocinolone Acetonide Cream contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluocinolone acetonide ($C_{24}H_{30}F_2O_6$).

Packaging and storage—Preserve in collapsible tubes or in tight containers.

USP Reference standards (11)—USP Fluocinolone Acetonide RS
USP Neomycin Sulfate RS**Identification**—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: It meets the requirements for the *Identification test* under *Fluocinolone Acetonide Cream*.

Minimum fill (755): meets the requirements.

Assay for neomycin—Proceed with Cream as directed in the *Assay* under *Neomycin Sulfate Cream*.

Assay for fluocinolone acetonide—Proceed with Cream as directed in the *Assay* under *Fluocinolone Acetonide Cream*.

Neomycin Sulfate and Fluorometholone Ointment

» Neomycin Sulfate and Fluorometholone Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of fluorometholone ($C_{22}H_{29}FO_4$).

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.

USP Reference standards (11)—

USP Fluorometholone RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The ratios of the retention time of the main peak to that of the internal standard peak obtained from the *Standard preparation* and the *Assay preparation* as directed in the *Assay for fluorometholone* do not differ by more than 2.0%.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin—Proceed with Ointment as directed in the *Assay* under *Neomycin Sulfate Ointment*.

Assay for fluorometholone—

Internal standard solution, Mobile solvent, and Standard preparation—Prepare as directed in the *Assay* under *Fluorometholone Cream*.

Assay preparation—Transfer an accurately weighed quantity of Ointment, equivalent to about 1 mg of fluorometholone, to a suitable container, add 20.0 mL of *Internal standard solution*, and mix.

Procedure—Treat 20.0 mL each of the *Standard preparation* and the *Assay preparation* in the following manner. To each add 10.0 mL of hexane, shake for about 15 minutes, then allow the layers to separate, and centrifuge, if necessary. Using the lower (acetonitrile) layer, proceed as directed for *Procedure* in the *Assay* under *Fluorometholone Cream*, beginning with "Using a suitable microsyringe." Calculate the quantity, in mg, of $C_{22}H_{29}FO_4$ in the portion of Ointment taken by the formula:

$$20C(R_U / R_S)$$

in which the terms are as defined therein.

Neomycin Sulfate and Flurandrenolide Cream

» Neomycin Sulfate and Flurandrenolide Cream contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of

the labeled amount of flurandrenolide ($C_{24}H_{33}FO_6$).

Packaging and storage—Preserve in collapsible tubes or in tight containers, protected from light.

USP Reference standards (11)—

USP Flurandrenolide RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: It meets the requirements for the *Identification test* under *Flurandrenolide Cream*.

Minimum fill (755): meets the requirements.

Assay for neomycin—Proceed with Cream as directed in the *Assay* under *Neomycin Sulfate Ointment*.

Assay for flurandrenolide—Proceed with Cream as directed in the *Assay* under *Flurandrenolide Cream*. Calculate the quantity, in mg, of $C_{24}H_{33}FO_6$ in the portion of Cream taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flurandrenolide RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Flurandrenolide Lotion

» Neomycin Sulfate and Flurandrenolide Lotion contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurandrenolide ($C_{24}H_{33}FO_6$).

Packaging and storage—Preserve in tight containers, protected from light.

USP Reference standards (11)—

USP Flurandrenolide RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: It meets the requirements for the *Identification test* under *Flurandrenolide Cream*.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

Minimum fill (755): meets the requirements.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Lotion, equivalent to about 3.5 mg of neomycin, blended for 3 to 5 minutes in a high-speed glass blender jar containing an accurately measured volume of *Buffer B.3* (CN 1-May-2017) sufficient to obtain a stock solution having a convenient concentration of neomycin. Dilute an accurately measured volume of this stock solution quantitatively with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution*

having a concentration of neomycin assumed to be equal to the median dose level of the *Standard*.

Assay for flurandrenolide—Proceed with Neomycin Sulfate and Flurandrenolide Lotion as directed in the *Assay* under *Flurandrenolide Cream*. Calculate the quantity, in mg, of $C_{24}H_{33}FO_6$ in the portion of Lotion taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flurandrenolide RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Flurandrenolide Ointment

» Neomycin Sulfate and Flurandrenolide Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of flurandrenolide ($C_{24}H_{33}FO_6$).

Packaging and storage—Preserve in collapsible tubes or in tight containers, protected from light.

USP Reference standards (11)—

USP Flurandrenolide RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: It meets the requirements for the *Identification test* under *Flurandrenolide Cream*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin—Proceed with Ointment as directed in the *Assay* under *Neomycin Sulfate Ointment*.

Assay for flurandrenolide—Proceed with Ointment as directed in the *Assay* under *Flurandrenolide Cream*. Calculate the quantity, in mg, of $C_{24}H_{33}FO_6$ in the portion of Ointment taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Flurandrenolide RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Gramicidin Ointment

» Neomycin Sulfate and Gramicidin Ointment contains the equivalent of not less than 90.0 percent and not more than 140.0 percent of the labeled amounts of neomycin and gramicidin.

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.

USP Reference standards (11)—

USP Gramicidin RS

USP Neomycin Sulfate RS

Thin-Layer Chromatographic Identification Test

(201BNP): meets the requirements.

Minimum fill (755): meets the requirements.**Water Determination, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.**Assay for neomycin**—Proceed with Ointment as directed in the Assay under *Neomycin Sulfate Ointment*.**Assay for gramicidin**—Proceed as directed for gramicidin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment dissolved in 50 mL of hexanes in a separator, and extracted with four 20-mL portions of 80 percent alcohol. Combine the extracts in a suitable volumetric flask, dilute with alcohol to volume, and mix. Dilute this solution quantitatively and stepwise with alcohol to obtain a *Test Dilution* having a concentration of gramicidin assumed to be equal to the median dose level of the Standard.**Neomycin Sulfate and Hydrocortisone Cream**

» Neomycin Sulfate and Hydrocortisone Cream contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.**USP Reference standards** (11)—

USP Hydrocortisone RS

USP Neomycin Sulfate RS

Identification—A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).B: The retention time of the major peaks for hydrocortisone in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone*.**Minimum fill** (755): meets the requirements.**Assay for neomycin**—Proceed with Cream as directed in the Assay under *Neomycin Sulfate Ointment*.**Assay for hydrocortisone**—Proceed with Cream as directed in the Assay for hydrocortisone under *Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Ophthalmic Ointment*.**Neomycin Sulfate and Hydrocortisone Ointment**

» Neomycin Sulfate and Hydrocortisone Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.**USP Reference standards** (11)—

USP Hydrocortisone RS

USP Neomycin Sulfate RS

Identification—A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).B: The retention time of the major peak for hydrocortisone in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone*.**Minimum fill** (755): meets the requirements.**Water Determination, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.**Assay for neomycin**—Proceed with Ointment as directed in the Assay under *Neomycin Sulfate Ointment*.**Assay for hydrocortisone**—Proceed with Ointment as directed in the Assay for hydrocortisone under *Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Ophthalmic Ointment*.**Neomycin Sulfate and Hydrocortisone Otic Suspension**

» Neomycin Sulfate and Hydrocortisone Otic Suspension is a sterile suspension containing not less than 90.0 percent and not more than 130.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone. It contains Acetic Acid, and may contain one or more suitable buffers, dispersants, and preservatives.

NOTE—Where Neomycin Sulfate and Hydrocortisone Otic Suspension is prescribed, without reference to the quantity of neomycin or hydrocortisone contained therein, a product containing 3.5 mg of neomycin and 10 mg of hydrocortisone per mL shall be dispensed.

Packaging and storage—Preserve in tight, light-resistant containers.**USP Reference standards** (11)—

USP Hydrocortisone RS

USP Neomycin Sulfate RS

Sterility Tests (71): meets the requirements.**pH** (791): between 4.5 and 6.0.**Assay for neomycin**—Using an accurately measured volume of Otic Suspension, freshly mixed and free from entrapped air, proceed as directed in the Assay for neomycin under *Neomycin and Polymyxin B Sulfates and Hydrocortisone Otic Solution*.**Assay for hydrocortisone**—

Mobile phase and Standard preparation—Prepare as directed in the Assay for hydrocortisone content under *Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Ophthalmic Ointment*.

Assay preparation—Transfer 3.0 mL of Otic Suspension, freshly mixed and free from entrapped air, to a 200-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix. Filter the solution, rejecting the first 10 mL of the filtrate.

Procedure—Proceed as directed for *Procedure* in the *Assay for hydrocortisone content under Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Ophthalmic Ointment*. Calculate the quantity, in mg, of $C_{21}H_{30}O_5$ in each mL of the Otic Suspension taken by the formula:

$$(66.67C)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Hydrocortisone RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Hydrocortisone Acetate Cream

» Neomycin Sulfate and Hydrocortisone Acetate Cream contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for hydrocortisone acetate in the chromatogram of the *Assay preparation*, corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone acetate*.

Minimum fill (755): meets the requirements.

Assay for neomycin—Proceed with Cream as directed in the *Assay under Neomycin Sulfate Ointment*.

Assay for hydrocortisone acetate—Proceed with Cream as directed in the *Assay under Hydrocortisone Acetate Lotion*.

Neomycin Sulfate and Hydrocortisone Acetate Lotion

» Neomycin Sulfate and Hydrocortisone Acetate Lotion contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for hydrocortisone acetate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone acetate*.

Minimum fill (755): meets the requirements.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), blending an accurately measured volume of Lotion for 3 to 5 minutes in a high-speed glass blender jar containing an accurately measured volume of *Buffer B.3* (CN 1-May-2017). Dilute an accurately measured volume of the solution so obtained quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of neomycin assumed to be equal to the median dose level of the *Standard*.

Assay for hydrocortisone acetate—Proceed with Lotion as directed in the *Assay under Hydrocortisone Acetate Lotion*.

Neomycin Sulfate and Hydrocortisone Acetate Ointment

» Neomycin Sulfate and Hydrocortisone Acetate Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Neomycin Sulfate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for hydrocortisone acetate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone acetate*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin—Proceed with the Ointment as directed in the *Assay under Neomycin Sulfate Ointment*.

Assay for hydrocortisone acetate—Proceed with the Ointment as directed in the *Assay under Hydrocortisone Acetate Lotion*.

Neomycin Sulfate and Hydrocortisone Acetate Ophthalmic Suspension

» Neomycin Sulfate and Hydrocortisone Acetate Ophthalmic Suspension is a sterile, aqueous suspension containing the equivalent of not less than 90.0 percent and not more than 130.0 per-

cent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in tight containers. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Neomycin Sulfate RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay for hydrocortisone acetate* exhibits a major peak for hydrocortisone acetate, the retention time of which corresponds with that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay for hydrocortisone acetate*.

Sterility Tests (71): meets the requirements.

pH (791): between 5.5 and 7.5.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, diluted quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Assay for hydrocortisone acetate—

Mobile phase—Prepare a solution containing *n*-butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6).

Internal standard solution—Prepare a solution of fluoxymesterone in chloroform containing 0.8 mg per mL.

Standard preparation—Dissolve about 10 mg of USP Hydrocortisone Acetate RS, accurately weighed, in 10.0 mL of *Internal standard solution*, dilute with about 40 mL of chloroform, and mix.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, equivalent to about 10 mg of hydrocortisone acetate, to a suitable container. Add 10.0 mL of *Internal standard solution* and about 40 mL of chloroform, shake vigorously for about 5 minutes, and allow the phases to separate. Use the clear chloroform layer as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm \times 30-cm column that contains packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the analyte and internal standard peaks is not less than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 15 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 and 1.0 for hydrocortisone acetate and fluoxymesterone, respectively. Calculate the quantity, in mg, of hydrocortisone acetate ($C_{23}H_{32}O_6$) in each mL of the Ophthalmic Suspension taken by the formula:

$$(W/V)(R_U/R_S)$$

in which *W* is the quantity, in mg, of USP Hydrocortisone Acetate RS taken to prepare the *Standard preparation*, *V* is the volume, in mL, of Ophthalmic Suspension taken, and *R_U* and *R_S* are the peak response ratios of the hydrocortisone acetate peak to the internal standard peak obtained from

the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate, Isoflupredone Acetate, and Tetracaine Hydrochloride Ointment

» Neomycin Sulfate, Isoflupredone Acetate, and Tetracaine Hydrochloride Ointment contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of neomycin, and not less than 92.5 percent and not more than 117.5 percent of the labeled amounts of isoflupredone acetate ($C_{23}H_{29}FO_6$) and tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in a suitable ointment base.

Packaging and storage—Preserve in collapsible tubes or well-closed containers.

Labeling—Label it to indicate that it is intended for veterinary use only.

USP Reference standards (11)—

USP Isoflupredone Acetate RS

USP Neomycin Sulfate RS

USP Tetracaine Hydrochloride RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

Test solution—To 2 g of Ointment in a centrifuge tube add 25 mL of chloroform, and heat at 60° for 5 minutes, with occasional shaking. Centrifuge, discard the chloroform layer, add 5 mL of water, shake, and filter. Use the filtrate.

Standard solution—Prepare a solution containing 2 mg of USP Neomycin Sulfate RS per mL.

Application volume: 1 μ L.

Developing solvent system: a mixture of water, butyl alcohol, glacial acetic acid, and pyridine (35:30:22:6).

Spray reagent: a solution of triketohydrindene hydrate in butyl alcohol (2 in 1000).

Procedure—Proceed as directed in the chapter, except to locate the spots by spraying with *Spray reagent* and heating at 100° for 5 minutes.

B: The retention time of the major peak for isoflupredone acetate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for isoflupredone acetate*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, a mixture of methanol and chloroform (3:2) being used instead of methanol in the titration vessel and the titration vessel being heated to between 45° and 55°.

Change to read:

Assay for neomycin—Proceed as directed under *Antibiotics—Microbial Assays* (81). Place an accurately weighed portion of Ointment in a centrifuge tube with 25 mL of chloroform. Heat at 60° for 3 minutes, shake until the Ointment is dissolved, centrifuge, and remove and discard the chloroform. Add 15 mL of chloroform, shake, centrifuge, and remove and discard the chloroform. Add 5.0 mL of water and 15 mL of chromatographic *n*-heptane, shake, centrifuge, and remove and discard the *n*-heptane layer. Dilute an accurately measured volume of the water layer quantitatively with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having

a concentration of neomycin assumed to be equal to the median dose level of the Standard.

Assay for isoflupredone acetate—

Mobile phase, Diluent, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Isoflupredone Acetate.

Assay preparation—Transfer an accurately weighed portion of Ointment, equivalent to about 4 mg of isoflupredone acetate, to a suitable container. Add 8.0 mL of *Internal standard solution*, 32.0 mL of *Diluent*, and about 10 glass beads. Shake for about 15 minutes, centrifuge, and use the clear chloroform portion.

Procedure—Proceed as directed in the Assay under Isoflupredone Acetate. Calculate the quantity, in mg, of isoflupredone acetate ($C_{23}H_{29}FO_6$) in the portion of Ointment taken by the formula:

$$W_S(R_U / R_S)$$

in which the terms are as defined therein.

Assay for tetracaine hydrochloride—

Standard preparation—Prepare a solution in chloroform having a known concentration of about 5.0 µg of USP Tetracaine Hydrochloride RS per mL.

Assay preparation—Transfer an accurately weighed portion of Ointment, equivalent to about 1.25 mg of tetracaine hydrochloride, to a 250-mL volumetric flask, add about 100 mL of chloroform, and warm on a steam bath for about 3 minutes to dissolve the Ointment. Cool to room temperature, dilute with chloroform to volume, and mix.

Blank solution—Transfer an accurately weighed portion of the ointment base, equivalent to the weight used in the *Assay preparation*, to a 250-mL volumetric flask. Add 100 mL of chloroform, warm on a steam bath for about 3 minutes to dissolve, and allow to stand until the solution has equilibrated to room temperature. Dilute with chloroform to volume, and mix well.

Procedure—Concomitantly determine the absorbances of the *Standard preparation*, the *Blank solution*, and the *Assay preparation* with a suitable spectrophotometer at the wavelength of maximum absorbance at about 310 nm, using chloroform to zero the instrument. Calculate the absorbance of the *Blank solution*, A_B , adjusted for weight difference between the *Assay preparation* and the *Blank solution*, by the formula:

$$A(W_T / W_B)$$

in which A is the absorbance of the *Blank solution*; W_T is the weight, in mg, of Ointment taken to prepare the *Assay preparation*; and W_B is the weight, in mg, of the ointment base taken to prepare the *Blank solution*. Calculate the quantity, in mg, of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in the portion of Ointment taken by the formula:

$$250C [(A_U - A_B) / A_S]$$

in which C is the concentration, in mg per mL, of USP Tetracaine Hydrochloride RS in the *Standard preparation*; A_B is as obtained above; and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate, Isoflupredone Acetate, and Tetracaine Hydrochloride Topical Powder

» Neomycin Sulfate, Isoflupredone Acetate, and Tetracaine Hydrochloride Topical Powder contains

the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 120.0 percent of the labeled amounts of isoflupredone acetate ($C_{23}H_{29}FO_6$) and tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to indicate that it is intended for veterinary use only.

USP Reference standards (11)—

USP Isoflupredone Acetate RS

USP Neomycin Sulfate RS

USP Tetracaine Hydrochloride RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

Test solution—Add 20 mL of chloroform to 1 g of Topical Powder, shake for 5 to 10 minutes, and centrifuge. Evaporate a 10-mL portion of the clear solution to dryness, and dissolve the residue in 1 mL of a mixture of chloroform and alcohol (1:1).

Standard solution: 0.5 mg of USP Isoflupredone Acetate RS per mL, in a mixture of chloroform and alcohol (1:1).

Application volume: 30 µL.

Developing solvent system: a mixture of methylene chloride and methanol (180:16), in a paper-lined chromatographic chamber.

Spray reagent: a solution of sulfuric acid in methanol (70 in 100).

Procedure—Proceed as directed in the chapter, except to use a plate that has been activated by heating in an oven at 105° for 60 minutes. Allow the plate to cool before using. Locate the spots under short- and long-wavelength UV light. Spray the plate with *Spray reagent*, heat at 90° for 30 minutes, and locate the spots under short- and long-wavelength UV light (presence of isoflupredone acetate).

B: Thin-Layer Chromatographic Identification Test (201)—

Test solution—To 1 g of Topical Powder in a centrifuge tube add 5 mL of water, and shake until dissolved. Prepare a suspension of 10 g of cation-exchange resin in 10 mL of water, add 5 mL of a solution of sodium hydroxide (1 in 2), mix, and wash the resin with water until the pH of the wash is about 9. Add 0.3 g of this suspension to the solution of Topical Powder, and shake for 10 seconds. Centrifuge for 1 minute, and discard the supernatant. Wash the resin in the tube with 10 mL of water, centrifuge, and discard the supernatant. Add 2 mL of 1 M ammonium hydroxide, shake for 10 seconds, and filter. Use the filtrate.

Standard solution, Application volume, Developing solvent system, Spray reagent, and Procedure—Proceed as directed in Identification test A under Neomycin Sulfate, Isoflupredone Acetate, and Tetracaine Hydrochloride Ointment (presence of neomycin).

Minimum fill (755): meets the requirements.

Loss on drying (731)—Dry about 2 g in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 8.0% of its weight.

Change to read:

Assay for neomycin—Proceed as directed under Antibiotics—Microbial Assays (81), the *Test Dilution* being prepared as follows. Use an accurately weighed quantity of Topical Powder diluted quantitatively with *Buffer B.3* (CN 1-May-2017) to obtain a solution having a suitable concentration of neomycin. Dilute this stock solution quantitatively with *Buffer*

B.3. (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Assay for isoflupredone acetate—

Mobile phase, Diluent, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Isoflupredone Acetate.

Assay preparation—Transfer an accurately weighed portion of Topical Powder, equivalent to about 4 mg of isoflupredone acetate, to a suitable container. Add 8.0 mL of *Internal standard solution*, 32.0 mL of *Diluent*, and about 10 glass beads. Shake for about 15 minutes, centrifuge, and use the clear chloroform portion.

Procedure—Proceed as directed in the Assay under Isoflupredone Acetate. Calculate the quantity, in mg, of isoflupredone acetate ($C_{23}H_{29}FO_6$) in the portion of Topical Powder taken by the formula:

$$W_S(R_U / R_S)$$

in which the terms are as defined therein.

Assay for tetracaine hydrochloride—

Standard preparation—Prepare a solution having a known concentration of 5.5 µg of USP Tetracaine Hydrochloride RS per mL.

Assay preparation—Transfer an accurately weighed portion of Topical Powder, equivalent to about 5.5 mg of tetracaine hydrochloride, to a 100-mL volumetric flask, dilute with water to volume, and mix. Pass about 30 mL through a fine, sintered-glass filter. Transfer 10.0 mL of the clear filtrate to a second 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 310 nm, with a suitable spectrophotometer, using water to zero the instrument. Calculate the quantity, in mg, of tetracaine hydrochloride ($C_{15}H_{24}N_2O_2 \cdot HCl$) in the portion of Topical Powder taken by the formula:

$$1000C(A_U / A_S)$$

in which *C* is the concentration, in mg per mL, of USP Tetracaine Hydrochloride RS in the *Standard preparation*; and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Methylprednisolone Acetate Cream

DEFINITION

Neomycin Sulfate and Methylprednisolone Acetate Cream contains the equivalent of NLT 90.0% and NMT 135.0% of the labeled amount of neomycin, and NLT 90.0% and NMT 110.0% of the labeled amount of methylprednisolone acetate ($C_{24}H_{32}O_6$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201BNP): Meets the requirements for neomycin

• B.

Solution A, Solution B, Standard solution, Sample solution, Adsorbent, Application volume, and Developing solvent system: Proceed as directed in the Assay for Methylprednisolone Acetate.

Analysis: Proceed with thin-layer chromatography as directed in the Assay for Methylprednisolone Acetate.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

• NEOMYCIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Cream containing nominally 3.5 mg of neomycin in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–135.0%

• METHYLPREDNISOLONE ACETATE

Solution A: Alcohol and chloroform (1:1)

Solution B: Alcohol and tetramethylammonium hydroxide TS (9:1)

Standard solution: 500 µg/mL of USP Methylprednisolone Acetate RS in *Solution A*

Sample solution: Transfer a portion of Cream containing nominally 5 mg of methylprednisolone acetate to a 125-mL separator, and add 50 mL of solvent hexane. Extract with three 10-mL portions of acetonitrile, and evaporate the combined extracts on a steam bath with the aid of a current of air nearly to dryness. Transfer the residue to a 10-mL volumetric flask with the aid of one 5-mL portion and two 2-mL portions of *Solution A*. Dilute with *Solution A* to volume.

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture (see *Chromatography* (621))

Application volume: 250 µL

Developing solvent system: Ethyl acetate and chloroform (7:5)

Analysis

Samples: *Standard solution* and *Sample solution*

Divide the plate into three equal sections, the left and right sections to be used for the *Sample solution* and *Standard solution*, respectively, and the center section for the blank. Apply the solutions as streaks 2.5 cm from the bottom of the designated section of the plate, and dry the streaks with the aid of a current of air. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Locate the principal bands from the *Standard solution* and the *Sample solution* (see also *Identification test B*) by viewing under short-wavelength UV light. Mark these bands and the corresponding band in the section of the plate representing the blank. Quantitatively remove the silica gel containing these bands, and transfer to separate glass-stoppered, 50-mL centrifuge tubes. Add 25.0 mL of alcohol to each tube, shake for 2 min, and centrifuge at about 1500 rpm for 5 min. Transfer 20.0 mL of each supernatant to separate glass-stoppered, 50-mL conical flasks. Add 2.0 mL of blue tetrazolium TS to each solution, and to each flask, add 2.0 mL of *Solution B*. Mix, and allow the solutions to stand in the dark for 90 min.

Instrumental conditions

Mode: Vis

Analytical wavelength: Maximum at about 525 nm

Cell: 1 cm

Calculate the percentage of the labeled amount of methylprednisolone acetate ($C_{24}H_{32}O_6$) in the portion of Cream taken:

$$\text{Result} = (A_U / A_S) \times (C_S / C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methylprednisolone Acetate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of methylprednisolone acetate in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers, protected from light.
- **USP REFERENCE STANDARDS (11)**
USP Methylprednisolone Acetate RS
USP Neomycin Sulfate RS

Neomycin and Polymyxin B Sulfates Cream

» Neomycin and Polymyxin B Sulfates Cream contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and polymyxin B. It may contain a suitable local anesthetic.

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Neomycin Sulfate RS
USP Polymyxin B Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Minimum fill (755): meets the requirements.

Change to read:

Assay for neomycin—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Cream, equivalent to about 1.75 mg of neomycin, shaken in a separator with about 50 mL of ether, and extracted with four 20-mL portions of *Buffer B.3* (CN 1-May-2017). Combine the aqueous extracts, and dilute with *Buffer B.3* (CN 1-May-2017) to an appropriate volume to obtain a stock solution of convenient concentration. Dilute this stock solution quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for polymyxin B—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Cream shaken with about 50 mL of ether in a separator, and extracted with four 25-mL portions of *Buffer B.6* (CN 1-May-2017). Combine the aqueous extracts, and dilute with *Buffer B.6* (CN 1-May-2017) to an appropriate volume to obtain a stock solution. Dilute this stock solution quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard (10 Polymyxin B Units per mL). Add to each test dilution of the Standard a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6* (CN 1-May-2017), to obtain the same concentration of neomycin present in the *Test Dilution*.

Neomycin and Polymyxin B Sulfates Solution for Irrigation

» Neomycin and Polymyxin B Sulfates Solution for Irrigation is a sterile, aqueous solution containing the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and of polymyxin B. It may contain a suitable preservative.

Packaging and storage—Preserve in tight containers.

Labeling—Label it to indicate that it is to be diluted for use in a urinary bladder irrigation and is not intended for injection.

USP Reference standards (11)—

USP Neomycin Sulfate RS
USP Polymyxin B Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

pH (791): between 4.5 and 6.0.

Assay for neomycin and Assay for polymyxin B—Proceed with Neomycin and Polymyxin B Sulfates Solution for Irrigation as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Hydrocortisone Otic Solution*.

Neomycin and Polymyxin B Sulfates Ophthalmic Ointment

DEFINITION

Neomycin and Polymyxin B Sulfates Ophthalmic Ointment is a sterile ointment containing Neomycin Sulfate and Polymyxin B Sulfate. It contains the equivalent of NLT 90.0% and NMT 130.0% of the labeled amounts of neomycin and polymyxin B.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201BNP):** Meets the requirements

ASSAY

• NEOMYCIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–130.0%

• POLYMYXIN B

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of *Buffer B.6*. Combine the aqueous extracts, and dilute with *Buffer B.6* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (10 Polymyxin B Units/mL). Add to each *Test Dilution* of the standard, a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6*,

to obtain the same concentration of neomycin as in the *Test Dilution* of the sample.

Acceptance criteria: 90.0%–130.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements in *Ophthalmic Products—Quality Tests* (771).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes.
- **USP REFERENCE STANDARDS** (11)
USP Neomycin Sulfate RS
USP Polymyxin B Sulfate RS

Neomycin and Polymyxin B Sulfates Ophthalmic Solution

» Neomycin and Polymyxin B Sulfates Ophthalmic Solution contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and polymyxin B. It may contain one or more suitable buffers, dispersants, irrigants, and preservatives.

Packaging and storage—Preserve in tight containers, and avoid exposure to excessive heat.

USP Reference standards (11)—

USP Neomycin Sulfate RS
USP Polymyxin B Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH (791): between 5.0 and 7.0.

Assay for neomycin and Assay for polymyxin B—Proceed with Ophthalmic Solution as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Hydrocortisone Otic Solution*.

Neomycin and Polymyxin B Sulfates and Bacitracin Ointment

» Neomycin and Polymyxin B Sulfates and Bacitracin Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin, polymyxin B, and bacitracin. It may contain a suitable local anesthetic.

Packaging and storage—Preserve in tight, light-resistant containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Bacitracin Zinc RS
USP Neomycin Sulfate RS
USP Polymyxin B Sulfate RS

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin and Assay for polymyxin B—Proceed with Ointment as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.

Assay for bacitracin—Proceed with Ointment as directed in the *Assay* under *Bacitracin Ointment*.

Neomycin and Polymyxin B Sulfates and Bacitracin Ophthalmic Ointment

DEFINITION

Neomycin and Polymyxin B Sulfates and Bacitracin Ophthalmic Ointment is a sterile ointment containing Neomycin Sulfate, Polymyxin B Sulfate, and Bacitracin. It contains the equivalent of NLT 90.0% and NMT 140.0% of the labeled amounts of neomycin, polymyxin B, and bacitracin.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201BNP): Meets the requirements

ASSAY

• NEOMYCIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–140.0%

• POLYMYXIN B

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of *Buffer B.6*. Combine the aqueous extracts, and dilute with *Buffer B.6* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (10 Polymyxin B Units/mL). Add to each *Test Dilution* of the standard, a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6*, to obtain the same concentration of neomycin as in the *Test Dilution* of the sample.

Acceptance criteria: 90.0%–140.0%

• BACITRACIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of 0.01 N hydrochloric acid. Combine the acid extracts, and dilute with 0.01 N hydrochloric acid to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.1* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (1.0 Bacitracin Unit/mL). If the *Sample solution* has a concentration of less than 100 Bacitracin Units/mL, add hydrochloric acid to each *Test Dilution* of the standard to obtain the same concentration of hydrochloric acid as in the *Test Dilution* of the sample.

Acceptance criteria: 90.0%–140.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements

Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ointment

» Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin, polymyxin B, and bacitracin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate in a suitable ointment base.

Packaging and storage—Preserve in collapsible tubes or in well-closed containers.

USP Reference standards (11)—

USP Bacitracin Zinc RS
USP Hydrocortisone Acetate RS
USP Neomycin Sulfate RS
USP Polymyxin B Sulfate RS

Identification—

A: It meets the requirements under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for hydrocortisone acetate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone acetate*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin and Assay for polymyxin B—Proceed with Ointment as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.

Assay for bacitracin—Proceed with Ointment as directed in the *Assay under Bacitracin Ointment*.

Assay for hydrocortisone acetate—Proceed with Ointment as directed in the *Assay under Hydrocortisone Acetate Lotion*.

Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ophthalmic Ointment

DEFINITION

Neomycin and Polymyxin B Sulfates, Bacitracin, and Hydrocortisone Acetate Ophthalmic Ointment contains the

equivalent of NLT 90.0% and NMT 140.0% of the labeled amounts of neomycin, polymyxin B, and bacitracin, and NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone acetate in a suitable ointment base.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201BNP): Meets the requirements
- **B.** The retention time of the hydrocortisone acetate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Hydrocortisone Acetate*.

ASSAY

• NEOMYCIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–140.0%

• POLYMYXIN B

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of *Buffer B.6*. Combine the aqueous extracts, and dilute with *Buffer B.6* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (10 polymyxin B units/mL). Add to each *Test Dilution* of the standard a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6*, to obtain the same concentration of neomycin as in the *Test Dilution* of the sample.

Acceptance criteria: 90.0%–140.0%

Analysis: Proceed as directed in the chapter. Add sufficient 0.01 N hydrochloric acid to a portion of the *Sample solution* so that the amount of hydrochloric acid in the *Test Dilution* is the same as in the median level of the standard. Dilute with *Buffer B.1* to obtain a *Test Dilution* having a bacitracin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–140.0%

• HYDROCORTISONE ACETATE

Mobile phase: Butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (475:475:70:35:30)

Standard solution: 0.10 mg/mL of USP Hydrocortisone Acetate RS in water-saturated chloroform

Sample solution: Nominally 0.10 mg/mL of hydrocortisone acetate from Ophthalmic Ointment prepared as follows. Transfer a portion of Ophthalmic Ointment containing nominally 2.5 mg of hydrocortisone acetate to a closable container. Add 25.0 mL of water-saturated chloroform and about 10 glass beads. Securely close the container, and shake vigorously for approximately 15 min. Centrifuge, and use the clear, lower chloroform layer.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; 10-μm packing L3

System suitabilitySample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Hydrocortisone Acetate RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of hydrocortisone acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements
- **OTHER REQUIREMENTS**: It meets the requirements in *Ophthalmic Products—Quality Tests* (771).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in collapsible ophthalmic ointment tubes.

 USP Polymyxin B Sulfate RS

Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment

» Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin, polymyxin B, and bacitracin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$).

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Bacitracin Zinc RS
 USP Lidocaine RS
 USP Neomycin Sulfate RS
 USP Polymyxin B Sulfate RS

Identification—

A: It meets the requirements under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for lidocaine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lidocaine*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin and Assay for polymyxin B—Proceed with Ointment as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.

Assay for bacitracin—Proceed with Ointment as directed in the *Assay under Bacitracin Ointment*.

Assay for lidocaine—

Mobile phase—Dissolve 4.44 g of docusate sodium in 1000 mL of a mixture of methanol and water (4:1), add 1 mL of 0.1 N sulfuric acid, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve a suitable quantity of USP Lidocaine RS, accurately weighed, in *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL.

Assay preparation—Transfer an accurately weighed quantity of Ointment, equivalent to about 40 mg of lidocaine, to a separator, add 50 mL of *n*-hexane, and shake until the specimen is in solution. Add 30 mL of *Mobile phase*, shake for 1 minute, and allow the layers to separate. Drain the lower layer into a 100-mL volumetric flask, and extract the *n*-hexane layer remaining in the separator with two 30-mL portions of *Mobile phase*, combining the lower layers in the volumetric flask. Dilute the combined extracts in the 100-mL volumetric flask with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak response as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of lidocaine ($C_{14}H_{22}N_2O$) in the portion of Ointment taken by the formula:

$$100C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Lidocaine RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ointment

» Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin, polymyxin B, and bacitracin. It may contain a suitable local anesthetic.

Sample solution: Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of 0.01 N hydrochloric acid. Combine the acid extracts, and dilute with 0.01 N hydrochloric acid to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.1* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (1.0 bacitracin Unit/mL). If the *Sample solution* has a concentration of less than 100 bacitracin Units/mL, add hydrochloric acid to each *Test Dilution* of the standard to obtain the same concentration of hydrochloric acid as in the *Test Dilution* of the sample.

Acceptance criteria: 90.0%–140.0%

• HYDROCORTISONE

Mobile phase: Methanol, glacial acetic acid, and water (500:1:500)

Diluent: Methanol and water (1:1)

Standard solution: 0.15 mg/mL of USP Hydrocortisone RS in *Diluent*

Sample solution: Transfer 1.5 g of Ophthalmic Ointment to a separator. Add 3 mL of *n*-hexane, and warm

gently on a steam bath with mild agitation until dissolved. Add 7 mL of *n*-hexane, mix by swirling, and extract with four 15-mL portions of *Diluent*. Collect the extracts in a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Filter the solution, rejecting the first 10 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; 10-μm packing L1

Flow rate: 2 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydrocortisone ($C_{21}H_{30}O_5$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Hydrocortisone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of hydrocortisone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **STERILITY TESTS (71):** Meets the requirements

 - USP Polymyxin B Sulfate RS

Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Acetate Ophthalmic Ointment

DEFINITION

Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Acetate Ophthalmic Ointment is a sterile ointment containing Neomycin Sulfate, Polymyxin B Sulfate, Bacitracin Zinc, and Hydrocortisone Acetate. It contains the equivalent of NLT 90.0% and NMT 140.0% of the labeled amounts of neomycin, polymyxin B, and bacitracin, and NLT 90.0% and NMT 110.0% of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201BNP):** Meets the requirements
- **B.** The retention time of the hydrocortisone acetate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay for Hydrocortisone Acetate.

ASSAY• **NEOMYCIN**(See *Antibiotics—Microbial Assays* (81).)**Sample solution:** Shake a portion of Ophthalmic Ointment in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.**Analysis:** Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.**Acceptance criteria:** 90.0%–140.0%• **POLYMYXIN B**(See *Antibiotics—Microbial Assays* (81).)**Sample solution:** Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of *Buffer B.6*. Combine the aqueous extracts, and dilute with *Buffer B.6* to a suitable volume.**Analysis:** Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (10 polymyxin B Units/mL). Add to each *Test Dilution* of the standard a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6*, to obtain the same concentration of neomycin as in the *Test Dilution* of the sample.**Acceptance criteria:** 90.0%–140.0%• **BACITRACIN**(See *Antibiotics—Microbial Assays* (81).)**Sample solution:** Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Lidocaine Ointment

» Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Lidocaine Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin, polymyxin B, and bacitracin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lidocaine (C₁₄H₂₂N₂O).

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.**USP Reference standards** (11)—

USP Bacitracin Zinc RS

USP Lidocaine RS

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

Identification—**A:** It meets the requirements under *Thin-Layer Chromatographic Identification Test* (201BNP).**B:** The retention time of the major peak for lidocaine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lidocaine*.**Minimum fill** (755): meets the requirements.**Water Determination, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.**Assay for neomycin**—Proceed with Ointment as directed in the *Assay for neomycin* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.**Assay for polymyxin B**—Proceed with Ointment as directed in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.**Assay for bacitracin**—Proceed with Ointment as directed in the *Assay for bacitracin* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.**Assay for lidocaine**—*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay for lidocaine* under

Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment.

Assay preparation—Using the Ointment, proceed as directed for *Assay preparation* in the *Assay for lidocaine* under *Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment*.

Procedure—Proceed as directed for *Procedure* in the *Assay for lidocaine* under *Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment*. Calculate the quantity, in mg, of lidocaine ($C_{14}H_{22}N_2O$) in the portion of Ointment taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Lidocaine RS in the *Standard preparation*; and r_U and r_S are the lidocaine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment

DEFINITION

Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment contains the equivalent of NLT 90.0% and NMT 130.0% of the labeled amounts of neomycin and polymyxin B, and NLT 90.0% and NMT 110.0% of the labeled amount of dexamethasone ($C_{22}H_{29}FO_5$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201BNP): Meets the requirements
- **B.** The retention time of the dexamethasone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Dexamethasone*.

ASSAY

• NEOMYCIN

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment in a separator with 50 mL of ether. Extract with four 20-mL portions of *Buffer B.3*. Combine the aqueous extracts, and dilute with *Buffer B.3* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.3* to obtain a *Test Dilution* having a neomycin concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–130.0%

• POLYMYXIN B

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Shake a portion of Ophthalmic Ointment with 50 mL of ether in a separator. Extract with four 25-mL portions of *Buffer B.6*. Combine the aqueous extracts, and dilute with *Buffer B.6* to a suitable volume.

Analysis: Proceed as directed in the chapter. Dilute the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a concentration that is nominally equivalent to the median level of the standard (10 polymyxin B units/mL). Add to each *Test Dilution* of the standard, a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6*, to obtain the same concentration of neomycin as in the *Test Dilution* of the sample.

Acceptance criteria: 90.0%–130.0%

• DEXAMETHASONE

Mobile phase: Acetonitrile and water (1 in 3)

Diluent: Acetonitrile and methanol (1:1)

Standard solution: 60 µg/mL of USP Dexamethasone RS in *Diluent*

Sample solution: Nominally 60 µg/mL of dexamethasone from Ophthalmic Ointment in *Diluent* prepared as follows. Transfer a portion of Ophthalmic Ointment containing nominally 3 mg of dexamethasone to a suitable test tube, and add 15 mL of cyclohexane. Heat in a water bath at $75 \pm 5^\circ$ for 10 min. If the Ophthalmic Ointment is not fully dissolved, heat on a steam bath for about 30 s, place a cap on the test tube, and place on a vortex mixer until all solid material is dissolved. Pass with suction through a medium-porosity, sintered-glass filter. Rinse the test tube twice with 10-mL portions of cyclohexane, passing the rinsings through the filter, and discard the filtrate. Wash the filter with about 10 mL of a mixture of *Diluent*, and collect the filtrate in a 50-mL beaker. Wash the test tube and the filter with several 10-mL portions of *Diluent*, and combine the washings in the 50-mL beaker. Transfer the contents of the beaker to a 50-mL volumetric flask with the aid of *Diluent*, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5- to 10-µm packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dexamethasone ($C_{22}H_{29}FO_5$) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

- r_U = peak response from the *Sample solution*
- r_S = peak response from the *Standard solution*
- C_S = concentration of USP Dexamethasone RS in the *Standard solution* (µg/mL)
- C_U = nominal concentration of dexamethasone in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements in *Ophthalmic Products—Quality Tests* (771).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes.
- **USP REFERENCE STANDARDS** (11)
 - USP Dexamethasone RS
 - USP Neomycin Sulfate RS
 - USP Polymyxin B Sulfate RS

Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Suspension

» Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Suspension contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of

the labeled amount of dexamethasone. It may contain one or more suitable buffers, stabilizers, preservatives, and suspending agents.

Packaging and storage—Preserve in tight, light-resistant containers in a cool place or at controlled room temperature. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Dexamethasone RS

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

Identification—Transfer a quantity of Ophthalmic Suspension, equivalent to about 2.5 mg of dexamethasone, to a suitable test tube, add 5 mL of chloroform, mix, and centrifuge. Apply 25 μ L of the lower chloroform layer and 25 μ L of a Standard solution of USP Dexamethasone RS in chloroform containing 500 μ g per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the R_f value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH (791): between 3.5 and 6.0.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, diluted quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for polymyxin B—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, diluted quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard. Add to each test dilution of the Standard a quantity of USP Neomycin Sulfate RS, dissolved in *Buffer B.6* (CN 1-May-2017), to obtain the same concentration of neomycin as is present in the *Test Dilution*.

Assay for dexamethasone—

Mobile phase and Chromatographic system—Proceed as directed in the *Assay for dexamethasone* under *Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment*.

Standard preparation—Dissolve an accurately weighed quantity of USP Dexamethasone RS in *Mobile phase* to obtain a solution having a known concentration of about 0.12 mg per mL.

Assay preparation—Dilute an accurately measured volume of freshly mixed Ophthalmic Suspension quantitatively with *Mobile phase* to obtain a solution containing about 0.12 mg of dexamethasone per mL.

Procedure—Proceed as directed for *Procedure* in the *Assay for dexamethasone* under *Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment*. Calculate the quantity, in mg per mL, of $C_{22}H_{29}FO_5$ in the Ophthalmic Suspension taken by the formula:

$$(CL / D)(r_u / r_s)$$

in which L is the labeled quantity, in mg per mL, of dexamethasone in the Ophthalmic Suspension, D is the concentration, in mg per mL, of dexamethasone in the *Assay preparation* based on the labeled quantity in the Ophthalmic Suspension and the extent of dilution, and the other terms are as defined therein.

Neomycin and Polymyxin B Sulfates and Gramicidin Cream

Assay for neomycin and Assay for polymyxin B—Using an accurately measured volume of Otic Suspension, freshly mixed and free from air bubbles, proceed as directed in the *Assay for neomycin* and the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Hydrocortisone Otic Solution*.

Assay for hydrocortisone—

Mobile phase, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay for hydrocortisone* under *Neomycin and Polymyxin B Sulfates, Bacitracin Zinc and Hydrocortisone Ophthalmic Ointment*.

Assay preparation—Transfer 3.0 mL of Otic Suspension, freshly mixed and free from air bubbles, to a 200-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix. Filter the solution, rejecting the first 10 mL of the filtrate.

Procedure—Proceed as directed for *Procedure* in the *Assay for hydrocortisone* under *Neomycin and Polymyxin B Sulfates, Bacitracin Zinc and Hydrocortisone Ophthalmic Ointment*. Calculate the quantity, in mg, of $C_{21}H_{30}O_5$ in each mL of the Otic Suspension taken by the formula:

$$(66.67C)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Hydrocortisone RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin and Polymyxin B Sulfates and Hydrocortisone Acetate Cream

» Neomycin and Polymyxin B Sulfates and Hydrocortisone Acetate Cream contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

Identification—

A: It meets the requirements under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for hydrocortisone acetate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for hydrocortisone acetate*.

Minimum fill (755): meets the requirements.

Assay for neomycin and Assay for polymyxin B—Proceed with Cream as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates Cream*.

Assay for hydrocortisone acetate—Proceed with Cream as directed in the *Assay* under *Hydrocortisone Acetate Lotion*.

Neomycin and Polymyxin B Sulfates and Hydrocortisone Acetate Ophthalmic Suspension

» Neomycin and Polymyxin B Sulfates and Hydrocortisone Acetate Ophthalmic Suspension is a sterile suspension of Hydrocortisone Acetate in an aqueous solution of Neomycin Sulfate and Polymyxin B Sulfate. It contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amounts of neomycin and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$). It may contain suitable buffers, preservatives, and suspending agents.

Packaging and storage—Preserve in tight containers. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH (791): between 5.0 and 7.0.

Assay for neomycin and Assay for polymyxin B—Proceed with Ophthalmic Suspension as directed in the *Assay for neomycin* and in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates and Bacitracin Zinc Ophthalmic Ointment*.

Assay for hydrocortisone acetate—Proceed with Ophthalmic Suspension as directed in the *Assay* under *Hydrocortisone Acetate Injectable Suspension*.

Neomycin and Polymyxin B Sulfates and Lidocaine Cream

» Neomycin and Polymyxin B Sulfates and Lidocaine Cream contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$).

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Lidocaine RS

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

Identification—

A: It meets the requirements under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for lidocaine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for lidocaine*.

Minimum fill (755): meets the requirements.

Assay for neomycin—Proceed with Cream as directed in the *Assay for neomycin* under *Neomycin and Polymyxin B Sulfates Cream*.

Assay for polymyxin B—Proceed with Cream as directed in the *Assay for polymyxin B* under *Neomycin and Polymyxin B Sulfates Cream*.

Assay for lidocaine—

Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay for lidocaine* under *Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment*.

Assay preparation—Using Cream, proceed as directed for the *Assay preparation* in the *Assay for lidocaine* under *Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment*.

Procedure—Proceed as directed for *Procedure* in the *Assay for lidocaine* under *Neomycin and Polymyxin B Sulfates, Bacitracin, and Lidocaine Ointment*. Calculate the quantity, in mg, of lidocaine ($C_{14}H_{22}N_2O$) in the portion of Cream taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Lidocaine RS in the *Standard preparation*; and r_U and r_S are the lidocaine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin and Polymyxin B Sulfates and Pramoxine Hydrochloride Cream

» Neomycin and Polymyxin B Sulfates and Pramoxine Hydrochloride Cream contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of neomycin and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pramoxine hydrochloride ($C_{17}H_{27}NO_3 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

USP Pramoxine Hydrochloride RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

Test solution—Disperse a quantity of Cream, equivalent to about 25 mg of neomycin, with 20 mL of chloroform in a 60-mL separator. Add 0.2 mL of 2.5 N hydrochloric acid, and shake. Allow the layers to separate for about 30 minutes. Discard the lower chloroform layer, and centrifuge the upper aqueous layer. Use a portion of the centrifuged aqueous layer.

Standard solution—Dissolve suitable quantities of USP Neomycin Sulfate RS and USP Polymyxin B Sulfate RS in 0.1 N hydrochloric acid to obtain a solution containing the equivalent of about 3.5 mg of neomycin and 10,000 USP Polymyxin B Units per mL.

Developing solvent system—Dissolve 0.1 g of benzalkonium chloride in a mixture of isopropyl alcohol, water, and ammonium hydroxide (60:40:10).

Procedure—Proceed as directed in the chapter. Place the plate in a chromatographic chamber saturated with *Developing solvent system*, and develop the chromatogram. Dry the plate at 105° for about 10 minutes, spray with a solution of ninhydrin in butyl alcohol (1 in 200), and heat the plate at 105° for about 15 minutes. The R_f values of the two principal spots in the chromatogram obtained from the *Test solution* correspond to those of the two principal spots in the chromatogram obtained from the *Standard solution*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pramoxine hydrochloride*.

pH (791)—Transfer 1 g of Cream to a small beaker, add 10 mL of carbon dioxide-free water, and mix: the pH is between 3.3 and 6.0.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Cream, equivalent to about 3.5 mg of neomycin, blended for 3 to 5 minutes in a high-speed blender with 249 mL of *Buffer B.3* (CN 1-May-2017) and 1 mL of polysorbate 80. Quantitatively dilute an accurately measured volume of this solution with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of neomycin assumed to be equal to the median level of the Standard (1 µg of neomycin per mL).

Change to read:

Assay for polymyxin—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Cream, equivalent to about 10,000 USP Polymyxin B Units, blended for 3 to 5 minutes in a high-speed blender with 199 mL of *Buffer B.6* (CN 1-May-2017) and 1 mL of polysorbate 80. Quantitatively dilute an accurately measured volume of this solution with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard (10 USP Polymyxin B Units per mL).

Assay for pramoxine hydrochloride—

Mobile phase—Dissolve 3.5 g of dibasic potassium phosphate in 1000 mL of water. Prepare a mixture of this solution, acetonitrile, and triethylamine (700:300:2), and adjust with phosphoric acid to a pH of 4.0 ± 0.1 . Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Prepare a solution of USP Pramoxine Hydrochloride RS in methanol to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer an accurately weighed portion of Cream, equivalent to about 10 mg of pramoxine hydrochloride, to a 50-mL volumetric flask, add about 5 mL of chloroform, and sonicate at about 40° to disperse the Cream. Allow to cool to room temperature, dilute with methanol to volume, and mix. Pass a portion of this solution through a glass fiber filter and a PTFE filter having a 0.45-µm porosity, discarding the first few mL of the filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector, a guard column that contains packing L7, and a 4.6-mm × 25-cm analytical column that contains packing L7. The column is maintained at a constant temperature of about 40°. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of pramoxine hydrochloride ($C_{17}H_{27}NO_3 \cdot HCl$) in each g of Cream taken by the formula:

$$50(C/W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pramoxine Hydrochloride RS in the *Standard preparation*; W is the weight, in g, of Cream taken to prepare the *Assay preparation*; and r_U and r_S are the peak areas for pramoxine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin and Polymyxin B Sulfates and Prednisolone Acetate Ophthalmic Suspension

» Neomycin and Polymyxin B Sulfates and Prednisolone Acetate Ophthalmic Suspension is a sterile suspension of Prednisolone Acetate in an aqueous solution of Neomycin Sulfate and Polymyxin B Sulfate. It contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amounts of neomy-

cin and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone acetate ($C_{23}H_{30}O_6$). It may contain suitable buffers, preservatives, and suspending agents.

Packaging and storage—Preserve in tight containers. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Neomycin Sulfate RS

USP Polymyxin B Sulfate RS

USP Prednisolone Acetate RS

Identification—The chromatogram of the *Assay preparation* obtained as directed in the *Assay for prednisolone acetate* exhibits a major peak for prednisolone acetate, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay for prednisolone acetate*.

Sterility Tests (71): meets the requirements.

pH (791): between 5.0 and 7.0.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, diluted quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for polymyxin B—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, diluted quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard. Add to each test dilution of the Standard a quantity of Neomycin Sulfate RS, dissolved in *Buffer B.6* (CN 1-May-2017), to obtain the same concentration of neomycin as is present in the *Test Dilution*.

Assay for prednisolone acetate—

Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay for prednisolone acetate* under *Neomycin Sulfate and Prednisolone Acetate Ophthalmic Suspension*.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, equivalent to about 2.5 mg of prednisolone acetate, to a suitable container, add 5.0 mL of *Internal standard solution* and about 100 mL of water-saturated chloroform, and shake by mechanical means for about 15 minutes. Allow to separate for about 15 minutes, and use the clear chloroform layer as the *Assay preparation*.

Procedure—Proceed as directed in the *Assay for prednisolone acetate* under *Neomycin Sulfate and Prednisolone Acetate Ophthalmic Suspension*. Calculate the quantity, in mg, of prednisolone acetate ($C_{23}H_{30}O_6$) in each mL of the Ophthalmic Suspension taken by the formula:

$$0.1(C/V)(R_U/R_S)$$

in which C is the concentration, in μg per mL, of USP Prednisolone Acetate RS in the *Standard preparation*, V is the vol-

ume, in mL, of Ophthalmic Suspension taken, and R_U and R_S are the peak response ratios of prednisolone acetate to betamethasone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Prednisolone Acetate Ointment

» Neomycin Sulfate and Prednisolone Acetate Ointment contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone acetate ($C_{23}H_{30}O_6$).

Packaging and storage—Preserve in collapsible tubes or in tight containers, protected from light.

USP Reference standards (11)—

USP Neomycin Sulfate RS

USP Prednisolone Acetate RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the major peak for prednisolone acetate in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay for prednisolone acetate*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for neomycin—Proceed with Ointment as directed in the *Assay under Neomycin Sulfate Ointment*.

Assay for prednisolone acetate—

Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay for prednisolone acetate* under *Neomycin Sulfate and Prednisolone Acetate Ophthalmic Suspension*.

Assay preparation—Transfer an accurately weighed portion of Ointment, equivalent to about 1 mg of prednisolone acetate, to a suitable container, add 2.0 mL of *Internal standard solution*, dilute with water-saturated chloroform to about 35 mL, and shake to dissolve the ointment. Transfer about 5 mL of this solution to a suitable container, and evaporate to dryness. Add about 5 mL of water-saturated chloroform, and sonicate for 5 minutes. Filter, and use the clear solution as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay for prednisolone acetate* under *Neomycin Sulfate and Prednisolone Acetate Ophthalmic Suspension*. Calculate the quantity, in mg, of prednisolone acetate ($C_{23}H_{30}O_6$) in the portion of Ointment taken by the formula:

$$0.04C(R_U/R_S)$$

in which C is the concentration, in μg per mL, of USP Prednisolone Acetate RS in the *Standard preparation*, and R_U and R_S are the peak response ratios of prednisolone acetate to betamethasone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Prednisolone Acetate Ophthalmic Suspension

» Neomycin Sulfate and Prednisolone Acetate Ophthalmic Suspension contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone acetate ($C_{23}H_{30}O_6$).

Packaging and storage—Preserve in tight containers. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Neomycin Sulfate RS

USP Prednisolone Acetate RS

Identification—

A: Filter a portion of Ophthalmic Suspension, freshly mixed but free from air bubbles, equivalent to about 60 mg of prednisolone acetate, discarding the filtrate. Wash the filter with about 10 mL of water, and dry at 105° for 3 hours: the IR absorption spectrum of a potassium bromide dispersion of the dried residue on the filter so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Prednisolone Acetate RS.

B: The chromatogram of the *Assay preparation* obtained as directed in the *Assay for prednisolone acetate* exhibits a major peak for prednisolone acetate, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay for prednisolone acetate*.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

pH (791): between 5.5 and 7.5.

Assay for neomycin—Proceed with Ophthalmic Suspension as directed in the *Assay for neomycin under Neomycin and Polymyxin B Sulfates and Prednisolone Acetate Ophthalmic Suspension*.

Assay for prednisolone acetate—

Mobile phase—Prepare a solution containing *n*-butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6).

Internal standard solution—Prepare a solution of betamethasone in tetrahydrofuran containing 10 mg per mL. Dilute this solution with water-saturated chloroform, and mix to obtain a solution having a concentration of about 1 mg per mL.

Standard preparation—Dissolve about 5 mg of USP Prednisolone Acetate RS, accurately weighed, in 10.0 mL of *Internal standard solution*. Use sonication, if necessary, dilute with water-saturated chloroform to 200.0 mL, and mix to obtain a solution having a known concentration of about 25 µg per mL.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, equivalent to about 2.5 mg of prednisolone acetate, to a suitable container, add 5.0 mL of *Internal standard solution* and about 100 mL of water-saturated chloroform, and shake by mechanical means for about 15 minutes. Allow to separate for about 15 minutes, and use the clear chloroform layer as the *Assay preparation*.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as di-

rected for *Procedure*: the resolution, *R*, between the analyte and internal standard peaks is not less than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 1.6 for betamethasone and 1.0 for prednisolone acetate. Calculate the quantity, in mg, of prednisolone acetate ($C_{23}H_{30}O_6$) in each mL of the Ophthalmic Suspension taken by the formula:

$$0.1(C/V)(R_U/R_S)$$

in which *C* is the concentration, in µg per mL, of USP Prednisolone Acetate RS in the *Standard preparation*, *V* is the volume, in mL, of Ophthalmic Suspension taken, and *R_U* and *R_S* are the peak response ratios of prednisolone acetate to betamethasone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Neomycin Sulfate and Triamcinolone Acetonide Cream

» Neomycin Sulfate and Triamcinolone Acetonide Cream contains the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of triamcinolone acetonide ($C_{24}H_{34}FO_6$).

Packaging and storage—Preserve in collapsible tubes or in tight containers.

USP Reference standards (11)—

USP Neomycin Sulfate RS

USP Triamcinolone Acetonide RS

Identification—

A: It meets the requirements for neomycin under *Thin-Layer Chromatographic Identification Test (201BNP)*.

B: Place 2 g of Cream in a conical flask, add 5.0 mL of chloroform, and shake for 10 minutes. Add 15 mL of alcohol, and shake for an additional 10 minutes. Filter the solution into a centrifuge tube, and evaporate the filtrate to dryness. Dissolve the residue in alcohol to obtain a solution containing about 250 µg of triamcinolone acetonide per mL. Proceed as directed in the *Identification test under Triamcinolone Acetonide Cream*, beginning with "Apply 10 µL of this solution": the specified result is observed.

Minimum fill (755): meets the requirements.

Assay for neomycin—Proceed with Cream as directed in the *Assay under Neomycin Sulfate Cream*.

Assay for triamcinolone acetonide—Proceed with Cream as directed in the *Assay under Triamcinolone Acetonide Cream*.

Neostigmine Bromide

$C_{12}H_{19}BrN_2O_2$ 303.20

Benzenaminium, 3-[[[(dimethylamino)carbonyl]oxy]-N,N,N-trimethyl-, bromide.
(*m*-Hydroxyphenyl)trimethylammonium bromide dimethylcarbamate [114-80-7].

» Neostigmine Bromide contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{19}BrN_2O_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Neostigmine Bromide RS

Identification—

A: *Infrared Absorption* (197K).

B: A solution (1 in 50) responds to the tests for Bromide (191).

Melting range (741): between 171° and 176°, with decomposition.

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 2.0% of its weight.

Residue on ignition (281): not more than 0.15%.

Sulfate—Dissolve 250 mg in 10 mL of water, and add 1 mL of 3 N hydrochloric acid and 1 mL of barium chloride TS: no turbidity is produced immediately.

Assay—Dissolve about 750 mg of Neostigmine Bromide, accurately weighed, in a mixture of 70 mL of glacial acetic acid and 20 mL of mercuric acetate TS, add 4 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 30.32 mg of $C_{12}H_{19}BrN_2O_2$.

Neostigmine Bromide Tablets

» Neostigmine Bromide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{12}H_{19}BrN_2O_2$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Neostigmine Bromide RS

Identification—Extract a quantity of powdered Tablets, equivalent to about 300 mg of neostigmine bromide, with three 10-mL portions of alcohol, filtering after each extraction. Evaporate the combined filtrates under a stream of nitrogen to dryness. Dissolve the residue in 10 mL of water, transfer to a 125-mL separator with the aid of 5 mL of water, extract with 15 mL of ether, and proceed with the following tests.

A: Evaporate 3 mL of the aqueous layer on a steam bath, under a stream of nitrogen, to dryness. Dissolve the residue, warming if necessary, in 1 mL of alcohol. Add 5 mL of chloroform, filter, evaporate the filtrate under a stream of nitrogen to dryness, and dry the residue at 105° for 30 minutes: the IR absorption spectrum of a potassium bromide dispersion of the residue of neostigmine bromide so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Neostigmine Bromide RS.

B: A portion of the aqueous layer responds to the tests for Bromide (191).

Dissolution, *Procedure for a Pooled Sample* (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—At the specified time interval, withdraw 30 mL of the solution under test, and filter. Pipet 10 mL each of

the filtered test solution, a Standard solution having a known concentration of USP Neostigmine Bromide RS, and water to provide a blank, into respective 125-mL separators. Proceed as directed for *Procedure* in the Assay, beginning with "Add 15 mL of a solution."

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{12}H_{19}BrN_2O_2$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Standard preparation—Dissolve a suitable quantity of USP Neostigmine Bromide RS, accurately weighed, in water, and dilute quantitatively and stepwise with water to obtain a solution having a concentration of about 40 µg per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of neostigmine bromide, to a 100-mL volumetric flask, add about 50 mL of water, shake by mechanical means for about 30 minutes, add water to volume, mix, and filter. Pipet 4 mL of the clear filtrate into a 50-mL volumetric flask, add water to volume, and mix.

Procedure—Pipet 10 mL each of Assay preparation and Standard preparation into respective 125-mL separators, and treat each solution as follows. Add 15 mL of a solution prepared by dissolving 25 mg of hexanitrodiphenylamine in methylene chloride to make 250 mL, without grinding the solid or heating the solution. Then add 10 mL of 5 N sodium hydroxide, and shake vigorously for 30 seconds. Collect the methylene chloride layer in a 100-mL volumetric flask, and extract the aqueous layer with three 15-mL portions of methylene chloride, collecting the methylene chloride extracts in each respective flask. Add methylene chloride to volume, and mix. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 420 nm, with a suitable spectrophotometer, using methylene chloride as the blank. Calculate the quantity, in mg, of $C_{12}H_{19}BrN_2O_2$ in the portion of Tablets taken by the formula:

$$1.25C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Neostigmine Bromide RS in the Standard preparation, and A_U and A_S are the absorbances of the solutions from the Assay preparation and the Standard preparation, respectively.

Neostigmine Methylsulfate

$C_{13}H_{22}N_2O_6S$ 334.39

Benzenaminium, 3-[[[(dimethylamino)carbonyl]oxy]-N,N,N-trimethyl-, methyl sulfate.

(*m*-Hydroxyphenyl)trimethylammonium methyl sulfate dimethylcarbamate [51-60-5].

» Neostigmine Methylsulfate contains not less than 98.0 percent and not more than 102.0 percent of $C_{13}H_{22}N_2O_6S$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Neostigmine Methylsulfate RS

Identification—

A: *Infrared Absorption* (197K).

B: Place about 1 mg in a small porcelain dish, add 2 mL of water and 0.5 mL of sodium hydroxide solution (2 in 5), and evaporate on a steam bath to dryness. Transfer the residue to a small test tube, and quickly heat in a suitable liq-

uid bath to 250°, continuing at that temperature for about 30 seconds. Cool, dissolve the residue in 0.5 mL of water, cool in ice water, and add 1 mL of diazobenzenesulfonic acid TS: a cherry-red color is produced.

C: Mix about 20 mg with 500 mg of sodium carbonate, and heat the mixture to fusion in a small crucible. Boil the fused mass with 10 mL of water until disintegrated, and filter. Add a few drops of bromine TS to the filtrate, heat to boiling, acidify with hydrochloric acid, and expel the excess bromine by boiling: the resulting solution responds to the tests for *Sulfate* (191).

Melting range (741): between 144° and 149°, determined after drying at 105° for 3 hours.

Loss on drying (731): Dry about 300 mg, accurately weighed, at 105° for 3 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Chloride—To 10 mL of a solution (1 in 50) add 1 mL of 2 N nitric acid and 1 mL of silver nitrate TS: no opalescence is produced immediately.

Sulfate ion—To 10 mL of a solution (1 in 50) add 1 mL of 3 N hydrochloric acid and 1 mL of barium chloride TS: no turbidity is produced immediately.

Assay—Place about 100 mg of Neostigmine Methylsulfate, accurately weighed, in a 500-mL Kjeldahl flask, dissolve in 150 mL of water, and add 40 mL of 2.5 N sodium hydroxide. Connect the flask by means of a distillation trap to a well-cooled condenser that dips into 25 mL of boric acid solution (1 in 25), distill about 150 mL of the contents of the flask, add methyl purple TS to the solution in the receiver, and titrate with 0.02 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.02 N sulfuric acid is equivalent to 6.688 mg of $C_{13}H_{22}N_2O_6S$.

Neostigmine Methylsulfate Injection

» Neostigmine Methylsulfate Injection is a sterile solution of Neostigmine Methylsulfate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{13}H_{22}N_2O_6S$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, protected from light.

USP Reference standards (11)—
USP Neostigmine Methylsulfate RS

Identification—Transfer a volume of Injection, containing the equivalent of 1 mg of neostigmine methylsulfate, to a small porcelain dish. Evaporate, if necessary, to 2 mL, add 0.5 mL of sodium hydroxide solution (2 in 5), and proceed as directed in *Identification test B* under *Neostigmine Methylsulfate*, beginning with "evaporate on a steam bath."

pH (791): between 5.0 and 6.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Standard preparation—Dissolve a suitable quantity of USP Neostigmine Methylsulfate RS, accurately weighed, in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 40 µg per mL.

Assay preparation—Pipet an accurately measured volume of Injection, equivalent to about 2 mg of neostigmine methylsulfate, into a 50-mL volumetric flask, add water to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Neostigmine Bromide Tablets*. Calculate the quantity, in mg, of $C_{13}H_{22}N_2O_6S$ in each mL of the Injection taken by the formula:

$$0.05(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Neostigmine Methylsulfate RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Netilmicin Sulfate

$(C_{21}H_{41}N_5O_7)_2 \cdot 5H_2SO_4$ 1441.55

D-Streptamine, O-3-deoxy-4-C-methyl-3-(methylamino)-β-L-arabinopyranosyl-(1→6)-O-[2,6-diamino-2,3,4,6-tetradeoxy-α-D-glycero-hex-4-enopyranosyl-(1→4)]-2-deoxy-N¹-ethyl-, sulfate (2:5) (salt).

O-3-Deoxy-4-C-methyl-3-(methylamino)-β-L-arabinopyranosyl-(1→4)-O-[2,6-diamino-2,3,4,6-tetradeoxy-α-D-glycero-hex-4-enopyranosyl-(1→6)]-2-deoxy-N¹-ethyl-L-streptamine sulfate (2:5) (salt) [56391-57-2].

» Netilmicin Sulfate has a potency equivalent to not less than 595 µg of netilmicin ($C_{21}H_{41}N_5O_7$) per mg, calculated on the dried basis. [NOTE—Netilmicin Sulfate is extremely hygroscopic. Protect from exposure to moisture.]

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Netilmicin Sulfate RS

USP Sisomicin Sulfate RS

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: It responds to the tests for *Sulfate* (191).

Specific rotation (781S): between +88° and +96°.

Test solution: 30 mg per mL, in water.

pH (791): between 3.5 and 5.5, in a solution containing 40 mg of netilmicin per mL.

Loss on drying (731)—Dry about 100 mg in vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 hours: it loses not more than 15.0% of its weight.

Residue on ignition (281): not more than 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Chromatographic purity—

Dilute phosphoric acid, Mobile phase, Resolution solution, Assay preparation, and Chromatographic system—Proceed as directed in the *Assay*.

Test solution—Use the Assay preparation.

Reference solution—Transfer 1.0 mL of the Test solution to a 100-mL volumetric flask, dilute with Mobile phase to volume, and mix.

Procedure—Separately inject equal volumes (about 20 μ L) of the Test solution and the Reference solution into the chromatograph, and measure the area responses for all the peaks, except those due to the solvent. Calculate the percentage of each impurity in the portion of Netilmicin Sulfate taken by the formula:

$$(r_i / r_s)$$

in which r_i is the peak response of each impurity in the chromatogram obtained from the Test solution, and r_s is the netilmicin peak response in the chromatogram obtained from the Reference solution: not more than 1% of any individual impurity is found, and not more than 5% of total impurities is found.

Assay—

Dilute phosphoric acid—Dilute 5.0 mL of phosphoric acid with water to 1000 mL, and mix.

Mobile phase—Dissolve 20.22 g of sodium 1-heptanesulfonate in Dilute phosphoric acid, dilute with Dilute phosphoric acid to 1000 mL, and mix. To 620 mL of this solution add 380 mL of acetonitrile, mix, and pass through a filter having a 0.45- μ m porosity. Make adjustments if necessary (see System Suitability under Chromatography (621)).

Resolution solution—Prepare a solution in Mobile phase containing about 1 mg of USP Netilmicin Sulfate RS and 1 mg of USP Sisomicin Sulfate RS per mL.

Standard preparation—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Netilmicin Sulfate RS in Mobile phase to obtain a solution having a known concentration of about 1 mg per mL.

Assay preparation—[NOTE—Use low-actinic glassware.] Transfer about 50 mg of Netilmicin Sulfate, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with Mobile phase, to volume, and mix.

Chromatographic system (see Chromatography (621))—The chromatograph is equipped with a 205-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution, R , between sisomicin and netilmicin is not less than 1. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 1%.

Procedure—Separately inject equal volumes (about 20 μ L) of the Standard preparation and the Assay preparation into the chromatograph, and measure the area responses for the major peaks. Calculate the quantity, in μ g, of netilmicin ($C_{21}H_{41}N_5O_7$) per mg of Netilmicin Sulfate taken by the formula:

$$(W_s P / W_u)(r_u / r_s)$$

in which W_s is the dry weight, in mg, of USP Netilmicin Sulfate RS taken to prepare the Standard preparation; P is the designated potency, in μ g of netilmicin ($C_{21}H_{41}N_5O_7$) per mg, of USP Netilmicin Sulfate RS; W_u is the dry weight, in mg, of Netilmicin Sulfate taken to prepare the Assay preparation; and r_u and r_s are the netilmicin peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Netilmicin Sulfate Injection

» Netilmicin Sulfate Injection is a sterile solution of Netilmicin Sulfate in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of netilmicin ($C_{21}H_{41}N_5O_7$). It may contain one or more suitable buffers, chelating agents, and preservatives.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Netilmicin Sulfate RS

USP Sisomicin Sulfate RS

Identification—It responds to Identification test A under Netilmicin Sulfate.

Bacterial Endotoxins Test (85)—It contains not more than 1.25 USP Endotoxin Units per mg of netilmicin.

Sterility Tests (71)—It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.

pH (791): between 3.5 and 6.0.

Particulate Matter in Injections (788): meets the requirements under small-volume injections.

Other requirements—It meets the requirements under Injections and Implanted Drug Products (1).

Assay—

Dilute phosphoric acid, Mobile phase, Resolution solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Netilmicin Sulfate.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of netilmicin, to a low-actinic, 100-mL volumetric flask. Dilute with Mobile phase to volume, and mix.

Procedure—Proceed as directed for Procedure in the Assay under Netilmicin Sulfate. Calculate the quantity, in mg, of netilmicin ($C_{21}H_{41}N_5O_7$) in each mL of Injection taken by the formula:

$$0.1(W_s P / 50V)(r_u / r_s)$$

in which V is the volume, in mL, of Injection taken to prepare the Assay preparation, and the other terms are as defined therein.

Nevirapine

$C_{15}H_{14}N_4O$	266.30
6 <i>H</i> -Dipyrido[3,2- <i>b</i> :2',3'- <i>e</i>][1,4]diazepin-6-one, 11-cyclopropyl-5,11-dihydro-4-methyl-; 11-Cyclopropyl-5,11-dihydro-4-methyl-6 <i>H</i> -dipyrido[3,2- <i>b</i> :2', 3'- <i>e</i>][1,4]diazepin-6-one [129618-40-2].	
Hemihydrate	275.31

DEFINITION

Nevirapine is anhydrous or contains one-half molecule of water of hydration. It contains NLT 98.0% and NMT 102.0% of $C_{15}H_{14}N_4O$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Do not dry the specimens.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY**• PROCEDURE**

Buffer: 0.025 M of monobasic ammonium phosphate in water prepared as follows. Dissolve 2.9 g of monobasic ammonium phosphate in 800 mL of water. Adjust with 1 N sodium hydroxide to a pH of 5.0, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (1:4)

Standard stock solution A: 0.24 mg/mL of USP Nevirapine Anhydrous RS prepared as follows. Dissolve a quantity of USP Nevirapine Anhydrous RS in Acetonitrile and *Mobile phase* (1:20). Sonicate for at least 15 min, allow to cool to room temperature, and dilute with *Mobile phase* to volume. [NOTE—Do not use after 78 h.]

Standard stock solution B: 0.24 mg/mL of USP Nevirapine Related Compound A RS prepared as follows. Dissolve a quantity of USP Nevirapine Related Compound A RS in a volume of a mixture of acetonitrile and *Mobile phase* (1:3). Sonicate for at least 15 min, allow to cool to room temperature, and dilute with *Mobile phase* to volume.

Standard stock solution C: 0.06 mg/mL of USP Nevirapine Related Compound B RS prepared as follows. Dissolve a quantity of USP Nevirapine Related Compound B RS in a volume of a mixture of acetonitrile and *Mobile phase* (10:22). Sonicate for at least 30 min, allow to cool to room temperature, and dilute with *Mobile phase* to volume.

System suitability solution: 0.03 mg/mL each of USP Nevirapine Anhydrous RS and USP Nevirapine Related Compound A RS and 0.015 mg/mL of USP Nevirapine Related Compound B RS from suitable volumes of *Standard stock solution A*, *Standard stock solution B*, and *Standard stock solution C*, respectively, in *Mobile phase*. [NOTE—Do not use after 78 h.]

Standard solution: 0.03 mg/mL of USP Nevirapine Anhydrous RS in *Mobile phase* from *Standard stock solution A*. [NOTE—Do not use after 78 h.]

Sample stock solution: 0.24 mg/mL of Nevirapine in *Mobile phase* prepared as follows. Transfer the required amount of Nevirapine to a suitable volumetric flask, and add 4% of the final volume with acetonitrile and 80% of the final volume with *Mobile phase*. Sonicate for at least 15 min, allow to cool to room temperature, and dilute with *Mobile phase* to volume.

Sample solution: 0.03 mg/mL of nevirapine anhydrous in *Mobile phase* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-μm packing L60

Column temperature: 35°

Flow rate: 1 mL/min

Injection size: 25 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are shown in Table 1.]

Suitability requirements

Resolution: NLT 5.0 between nevirapine related compound B and nevirapine, and NLT 7.4 between nevirapine and nevirapine related compound A; *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nevirapine ($C_{15}H_{14}N_4O$) in the portion of Nevirapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)

C_U = concentration of Nevirapine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm (Official 1-Jan-2018)

• ORGANIC IMPURITIES

Buffer, **Mobile phase**, **System suitability solution**, and **Standard stock solution A:** Proceed as directed in the Assay.

Standard solution: 0.2 μg/mL of USP Nevirapine Anhydrous RS in *Mobile phase* from *Standard stock solution A*

Sample solution: 0.24 mg/mL of Nevirapine in *Mobile phase* prepared as follows. Transfer the required amount of Nevirapine to a suitable volumetric flask, and add 4% of the final volume with acetonitrile and 80% of the final volume with *Mobile phase*. Sonicate for at least 15 min, allow to cool to room temperature, and dilute with *Mobile phase* to volume.

Chromatographic system: Proceed as directed in the Assay, except for *Run time* and *Injection size*.

Run time: At least 80 min

Injection size: 25 μL for *System suitability*; 50 μL for *Analysis*

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are shown in Table 1.]

Suitability requirements

Resolution: NLT 5.0 between nevirapine related compound B and nevirapine, and NLT 7.4 between nevirapine and nevirapine related compound A; *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Nevirapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of nevirapine from the *Standard solution*

C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (μg/mL)

C_U = concentration of nevirapine anhydrous in the *Sample solution* (μg/mL)

F = relative response factor for each impurity (see Table 1)

Acceptance criteria See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Nevirapine related compound B	0.7	1.3	0.2
Nevirapine	1.0	1.0	—
Nevirapine related compound A	1.5	1.0	0.2
Nevirapine impurity C	2.8	1.0	0.2
Any other individual unspecified impurity	—	1.0	0.1
Total impurities	—	—	0.6

SPECIFIC TESTS

• WATER DETERMINATION, Method I (921)

For Nevirapine anhydrous: NMT 0.2%

For Nevirapine hemihydrate: 3.1%–3.9%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **LABELING:** Label to indicate whether it is anhydrous or the hemihydrate.

• USP REFERENCE STANDARDS (11)

USP Nevirapine Anhydrous RS

USP Nevirapine Hemihydrate RS

USP Nevirapine Related Compound A RS

USP Nevirapine Related Compound B RS

5,11-Dihydro-4-methyl-6H-dipyrido[3,2-*b*:2',3'-*e*][1,4]diazepin-6-one.

C₁₂H₁₀N₄O 226.23

Nevirapine Oral Suspension

DEFINITION

Nevirapine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of nevirapine (C₁₅H₁₄N₄O).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHY (201)

Standard solution: 5 mg/mL of USP Nevirapine Anhydrous RS in chloroform

Sample solution: Transfer a volume of Oral Suspension, equivalent to 10 mg of nevirapine, to an 8-mL glass stoppered tube. Pipet 2.0 mL of chloroform into the tube. Shake the solution and allow the two phases to separate; then, using a disposable glass Pasteur pipet, remove some of the organic layer from the bottom, and transfer it to another container.

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel 60 F254

Application volume: 5 µL

Developing solvent system: Ethyl acetate, isopropanol, and concentrated ammonium hydroxide (18:2:0.1)

Spray reagent: 1.35 g of ferric chloride in 25 mL of water and 1.64 g of potassium ferricyanide in 25 mL of water. Mix the two solutions immediately before use.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop in a chamber saturated with a solvent system until the solvent front has moved 6–7 cm from the point of application. Remove the plate from the chamber, mark the solvent front, and dry. Examine under UV light at 254 nm, and outline the spots with a soft pencil. Spray the plate with *Spray reagent*.

Acceptance criteria: The *R_f* value (approximately 0.4–0.5) of the principal blue spot, under UV and after spraying, from the *Sample solution*, corresponds to that from the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Diluent: Methanol and water (1:4)

Solution A: 13.6 g of monobasic potassium phosphate in 1900 mL of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL.

Solution B: Acetonitrile and *Solution A* (3:97)

Solution C: Acetonitrile and *Solution A* (24:76)

Mobile phase: See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
1	100	0
31	0	100
32	100	0
42	100	0

Standard stock solution: Dissolve 50 mg of USP Nevirapine Anhydrous RS in 20 mL of methanol in a 50-mL volumetric flask. Sonicate with intermittent swirling until the sample dissolves. Add water to 1 cm below the meniscus, cool to room temperature, and dilute with water to volume. The concentration is 1 mg/mL of nevirapine.

Standard solution: 0.3 mg/mL of nevirapine from the *Standard stock solution* diluted with *Diluent*

Stock impurity solution: 3 mg of USP Nevirapine Related Compound A RS and 3 mg of USP Nevirapine Related Compound B RS in 20 mL of methanol in a 100-mL volumetric flask. Sonicate to dissolve. Add water to 1 cm below the meniscus, cool to room temperature, and dilute with water to volume.

System suitability solution: Transfer 15.0 mL of *Standard stock solution* and 2.0 mL of *Stock impurity solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Weight determination: Using a 1- to 10-mL suitable pipet and a positive displacement tip, withdraw 5.0 mL of Oral Suspension. The sample should be free of air bubbles. Dispense into a tared vial, and record the weight of the Oral Suspension to ±0.1 mg.

Sample solution: Using a 1- to 10-mL suitable pipet and a positive displacement tip, withdraw Oral Suspension equivalent to 60 mg of nevirapine. The sample should be free of air bubbles. Remove the excess Oral Suspension by wiping the outside of the tip carefully so as not to touch the opening of the tip, and deliver the sample into a 200-mL tared volumetric flask. Record the sample weight to the nearest ±0.1 mg. Add 40 mL of methanol, and sonicate for 5 min with intermittent swirling. Add water to 1 cm below the meniscus. Do not shake the flask. Allow the solution to attain room temperature, and dilute with water to volume. Shake the flask gently, and allow to stand for 5 min.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4.6-mm × 15-cm; 3.5-μm packing L10**Guard column:** 4.6-mm × 12.5-mm; 5-μm packing L10**Column temperature:** 35°**Flow rate:** 1.5 mL/min**Injection size:** 20 μL**System suitability****Samples:** *Standard solution* and *System suitability solution***Suitability requirements****Resolution:** NLT 3.0 between nevirapine and nevirapine related compound A; NLT 1.7 between nevirapine and nevirapine related compound B, *System suitability solution***Tailing factor:** NMT 1.5 for the nevirapine peak, *System suitability solution***Relative standard deviation:** NMT 2.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*Measure the responses for the nevirapine peak. Calculate the percentage of C₁₅H₁₄N₄O in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL) C_U = nominal concentration of the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**• **DISSOLUTION (711)****Medium:** 0.1 N hydrochloric acid; 900 mL**Apparatus 2:** 25 rpm**Time:** 45 min**Analysis:** Determine the amount of C₁₅H₁₄N₄O dissolved by using the following method.**Diluent:** Dehydrated alcohol and water (1:1)**Mobile phase:** Acetonitrile and water (23:77)**System suitability solution:** Transfer 10 mg of USP Nevirapine Anhydrous RS and 15 mg of methylparaben to a 250-mL volumetric flask, dissolve with 2 mL of *Diluent*, and dilute with *Medium* to volume.**Standard solution:** Transfer 28 mg of USP Nevirapine Anhydrous RS to a 500-mL volumetric flask, add 2 mL of *Diluent*, and sonicate for 1 min. The Standard will not be completely dissolved at this point. Dilute with *Medium* to volume, and visually examine the solution to ensure that the Standard is completely dissolved. The final concentration is 0.056 mg/mL of nevirapine.**Sample solution:** For sample mixing, gently shake the bottle for approximately 10 s by inverting it slowly and rotating it from side to side. The sample should be free of air bubbles. Do not sonicate the sample. Using a 1- to 10-mL suitable positive displacement pipet set at 5 mL, withdraw the equivalent of 50 mg of nevirapine. Remove excess Oral Suspension by wiping the outside of the tip carefully so as not to touch the opening of the tip. Introduce the sample into the dissolution vessel over a period of 1–2 s by immersing the tip of the pipet midway between the paddle and the side of the vessel, approximately 1 cm below the meniscus. Similarly dispense the Oral Suspension into the other vessels. At 45 min, withdraw 5 mL of the solution under test, and pass through a nylon filter of 0.45-μm pore size, discarding the first 2 mL.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 214 nm**Column:** 3.9-mm × 15-cm; 5-μm packing L1**Guard column:** 3.9-mm × 20-mm; packing L1**Flow rate:** 1 mL/min**Injection size:** 10 μL**System suitability****Samples:** *System suitability solution* and *Standard solution***Suitability requirements****Resolution:** NLT 5.0 between nevirapine and methylparaben, *System suitability solution***Tailing factor:** NMT 1.8, *System suitability solution***Relative standard deviation:** NMT 2.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*

Record the chromatograms for at least 14 min, and measure the responses for the nevirapine peaks.

Calculate the percentage of C₁₅H₁₄N₄O dissolved:

$$\text{Result} = (r_U \times C_S \times V_1) / (r_S \times V_2 \times L) \times 100$$

 r_U = peak response from the *Sample solution* C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL) V_1 = volume of the *Medium*, 900 mL r_S = peak response from the *Standard solution* V_2 = volume of Oral Suspension taken (mL) L = label claim (mg/mL)**Tolerances:** NLT 80% (Q) of the labeled amount of C₁₅H₁₄N₄O is dissolved.**IMPURITIES****Organic Impurities**• **PROCEDURE****Diluent, Solution A, Solution B, Solution C, and Mobile phase:** Prepare as directed in the *Assay*.**Standard stock solution:** Use the *Standard stock solution*, prepared as directed in the *Assay*.**Standard solution:** 0.3 μg/mL of nevirapine from the *Standard stock solution* diluted with *Diluent***System suitability solution:** Prepare as directed in the *Assay*.**Weight determination:** Use the weight obtained as directed for *Weight determination* in the *Assay*.**Sample solution:** Prepare as directed in the *Assay*.**Chromatographic system****Mode:** LC**Detector:** UV 254 nm**Column:** 4.6-mm × 15-cm; 3.5-μm packing L10**Column temperature:** 35°**Flow rate:** 1.5 mL/min**Injection size:** 20 μL**System suitability****Samples:** *Standard solution* and *System suitability solution***Suitability requirements****Resolution:** NLT 3.0 between nevirapine and nevirapine related compound A and NLT 1.7 between nevirapine and nevirapine related compound B, *System suitability solution***Tailing factor:** NMT 1.5 for nevirapine, *System suitability solution***Relative standard deviation:** NMT 10.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each unknown impurity in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response for each impurity from the *Sample solution*
 r_S = peak response for nevirapine from the *Standard solution*
 C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of nevirapine in the *Sample solution* (mg/mL)

Acceptance criteria

Individual unknown impurities: NMT 0.1%

Total unknown impurities: NMT 0.2%

[NOTE—The excipients and their degradation products should not be included in the determination of impurities.]

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Escherichia coli*. The total aerobic microbial count does not exceed 100 cfu/mL, and the total combined molds and yeasts count does not exceed 50 cfu/mL.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)
 - USP Nevirapine Anhydrous RS
 - USP Nevirapine Related Compound A RS
 5,11-Dihydro-6H-11-ethyl-4-methyl-dipyrido[3,2-b:2',3'-e][1,4]diazepin-6-one.
 $C_{14}H_{14}N_4O$ 254.29
 - USP Nevirapine Related Compound B RS
 5,11-Dihydro-4-methyl-6H-dipyrido[3,2-b:2',3'-e][1,4]diazepin-6-one.
 $C_{12}H_{10}N_4O$ 226.23

Nevirapine Tablets**DEFINITION**

Nevirapine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Sample: Transfer a portion of powdered Tablets equivalent to 25 mg of nevirapine to a 50-mL volumetric flask. Dissolve in 10 mL of methylene chloride. Swirl the solution for 30–60 s, and pass through a medium sintered-glass, fritted vacuum funnel. Using a glass syringe, pass the filtrate through a Teflon filter of 0.45- μ m pore size. Dry the extract at 105° for a minimum of 1 h.

Acceptance criteria: Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY**PROCEDURE**

Mobile phase: Acetonitrile and water (23:77)
Diluent: Dehydrated alcohol and water (1:1)
System suitability solution: 0.025 mg/mL of USP Nevirapine Anhydrous RS and 0.025 mg/mL of USP Nevirapine Related Compound A RS in *Diluent*
Standard solution: 0.025 mg/mL of USP Nevirapine Anhydrous RS in *Diluent*
Sample stock solution: Nominally 1 mg/mL of nevirapine in *Diluent* prepared as follows. Transfer nevirapine, from finely powdered Tablets (NLT 20), to a suitable size volumetric flask, and add 75% of the final volume with *Diluent*. Sonicate the solution for 20 min,

then shake for 20 min. Cool to room temperature, and dilute with *Diluent* to volume. Centrifuge a portion of the resulting solution at 1500 rpm for 5 min.

Sample solution: Nominally 0.025 mg/mL of nevirapine in *Diluent* from the *Sample stock solution*. Filter a portion of the resulting solution, and discard the first 2 mL of the filtrate.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 3.9-mm \times 15-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between nevirapine and nevirapine related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nevirapine from the *Sample solution*

r_S = peak response of nevirapine from the *Standard solution*

C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)

C_U = nominal concentration nevirapine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: 0.1 M phosphate buffer, pH 2.0 (transferring 3.9 mL/L of concentrated phosphoric acid and 5.73 g/L of monobasic sodium phosphate monohydrate in water, adjust with phosphoric acid to a pH of 2.0 ± 0.02); 900 mL

Apparatus 2: 50 rpm. [NOTE—Use stainless steel paddles only. Do not use paddles coated with polytetrafluoroethylene.]

Time: 60 min

Mobile phase, Diluent, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Standard stock solution A: 0.054 mg/mL of USP Nevirapine Anhydrous RS. Add 10% of the final volume with alcohol and 50% of the final volume of *Medium*. Sonicate for 20 min to dissolve, allow to cool to room temperature, and dilute with *Medium* to volume.

Standard stock solution B: 0.028 mg/mL of USP Nevirapine Related Compound A RS. Add 0.8% of the final volume of *Diluent*, sonicate until completely dissolved, and dilute with *Medium* to volume.

Standard solution: 0.014 mg/mL of USP Nevirapine Anhydrous RS from *Standard stock solution A* in *Medium*

System suitability solution: 0.014 mg/mL of USP Nevirapine Anhydrous RS from *Standard stock solution A* and 0.014 mg/mL of USP Nevirapine Related Compound A RS from *Standard stock solution B* in *Medium*

Sample solution: Pass 20 mL of the solution under test through a suitable nylon or glass fiber filter of 0.45- μ m pore size, and dilute with *Medium* to obtain a solution having a final concentration of 0.014 mg/mL of nevirapine.

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the percentage of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/D_U) \times V \times (100/L)$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)
 D_U = dilution factor for the *Sample solution*
 V = volume of *Medium*, 900 mL
 L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of nevirapine ($C_{15}H_{14}N_4O$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Mobile phase, Diluent, System suitability solution, Sample stock solution, and Sample solution: Proceed as directed in the *Assay*.

Standard solution: 0.125 µg/mL of USP Nevirapine Anhydrous RS from *Standard stock solution A* in *Diluent*

Chromatographic system: Proceed as directed in the *Assay*, except use a run time of at least 13 min.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between nevirapine and nevirapine related compound A, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each unknown impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each unknown impurity from the *Sample solution*
 r_S = peak response of nevirapine from the *Standard solution*
 C_S = concentration of USP Nevirapine Anhydrous RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration nevirapine in the *Sample solution* (mg/mL)

[NOTE—Disregard all peaks due to the solvent or excipients and impurity peaks less than 0.1%.]

Acceptance criteria

Individual unknown impurity: NMT 0.1%

Total unknown impurities: NMT 0.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Nevirapine Anhydrous RS
 USP Nevirapine Related Compound A RS
 5,11-Dihydro-6H-11-ethyl-4-methyl-
 dipyrrodo[3,2-b:2',3'-e][1,4]diazepin-6-one
 $C_{14}H_{14}N_4O$ 254.29

Niacin

$C_6H_5NO_2$ 123.11
 3-Pyridinecarboxylic acid;
 Nicotinic acid [59-67-6].

DEFINITION

Niacin contains NLT 98.0% and NMT 102.0% of niacin ($C_6H_5NO_2$), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION (197M)**• **B. ULTRAVIOLET ABSORPTION (197U)**

Wavelength range: 200–300 nm

Buffer solution: Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water. Adjust with 50% sodium hydroxide solution to a pH of 7.0.

Sample solution: 20 µg/mL in *Buffer solution*

Acceptance criteria: Meets the requirements. The A_{239}/A_{263} ratio is 0.46–0.52.

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Diluent: Methanol and water (82:18)

Mobile phase: Methanol and water (82:18), adjusted with glacial acetic acid to a pH of 3.15 ± 0.05

System suitability solution: 0.25 mg/mL of USP Niacin RS, 0.050 mg/mL of USP 6-Hydroxynicotinic Acid RS, and 0.10 mg/mL of pyridine in *Diluent*

Standard solution: 0.25 mg/mL of USP Niacin RS in *Diluent*

Sample solution: 0.25 mg/mL of Niacin in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 5-µm packing L8

Flow rate: 1.0 mL/min

Injection volume: 25 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for pyridine, 6-hydroxynicotinic acid, and niacin are about 0.14, 0.64, and 1.0, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 1.5 between pyridine and 6-hydroxynicotinic acid and NLT 1.5 between 6-hydroxynicotinic acid and niacin, *System suitability solution*

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of niacin ($C_6H_5NO_2$) in the portion of Niacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of niacin from the *Sample solution*
 r_S = peak response of niacin from the *Standard solution*
 C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)
 C_U = concentration of Niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **CHLORIDE AND SULFATE**, Chloride (221)
Standard: 0.15 mL of 0.020 N hydrochloric acid
Sample: 0.50 g of Niacin
Acceptance criteria: NMT 0.02%
- **CHLORIDE AND SULFATE**, Sulfate (221)
Standard: 0.10 mL of 0.020 N sulfuric acid
Sample: 0.50 g of Niacin
Acceptance criteria: NMT 0.02%

Delete the following:

- **HEAVY METALS**, Method I (231)
Test preparation: Mix 1 g with 4 mL of 1 N acetic acid, and dilute with water to 25 mL. Heat gently until solution is complete, and cool.
Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)
- **RELATED COMPOUNDS**
Solution A: Dissolve 0.6 g of glacial acetic acid in 1 L of water, and adjust with 10% ammonium hydroxide solution to a pH of 5.6.
Solution B: Acetonitrile and methanol (1:1)
Mobile phase: Gradient elution. See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10 ^a	100	0
30	20	80
35	20	80
36	100	0
48	100	0

^a The gradient start time may be adjusted to achieve the required resolution between the 6-methylnicotinic acid and 6,6'-dinicotinic acid peaks of the System suitability solution.

System suitability solution: Transfer 3 mg each of USP 6-Methylnicotinic Acid RS, USP 6,6'-Dinicotinic Acid RS, and pyridine to a 100-mL volumetric flask, dissolve, and dilute with Solution A to volume. Transfer 2.0 mL of the resultant solution to a 5-mL volumetric flask, and dilute with Solution A to volume.

Standard solution: 0.012 mg/mL of USP Niacin RS in Solution A

Sample solution: Transfer 120 mg of Niacin to a 10-mL volumetric flask, add 200 µL of 10% ammonium hydroxide solution, and dilute with Solution A to volume. Shake the flask until the Niacin is completely dissolved.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 25-cm; 4-µm packing L1

Column temperature: 15°

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for 6-methylnicotinic acid, 6,6'-dinicotinic acid, and pyridine are about 1.0, 1.03, and 1.4, respectively, System suitability solution.]

Suitability requirements

Resolution: NLT 1.5 between 6-methylnicotinic acid and 6,6'-dinicotinic acid peaks, System suitability solution

Relative standard deviation: NMT 10.0% for replicate injections, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Niacin taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of each impurity from the Sample solution

r_s = peak response of niacin from the Standard solution

C_s = concentration of USP Niacin RS in the Standard solution (mg/mL)

C_u = concentration of Niacin in the Sample solution (mg/mL)

Acceptance criteria: See Table 2. Disregard any impurity peak less than 0.03%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Isocinchomeronic acid	0.38	0.05
6-Hydroxynicotinic acid	0.63	0.05
Isonicotinic acid	0.92	0.05
Niacin	1.00	—
6-Methylnicotinic acid	2.61	0.05
6,6'-Dinicotinic acid	2.68	0.05
5-Nitronicotinic acid	2.76	0.05
Pyridine	3.76	0.05
3-Nitropyridine	3.83	0.05
3,5-Dinitropyridine	4.03	0.05
3-Ethylpyridine	4.72	0.05
5-Ethyl-2-methylpyridine	5.00	0.05
Any individual unspecified impurity	—	0.05
Total impurities	—	0.20

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 1 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP 6,6'-Dinicotinic Acid RS
USP 6-Hydroxynicotinic Acid RS
USP 6-Methylnicotinic Acid RS
USP Niacin RS

Niacin Injection

» Niacin Injection is a sterile solution of Niacin and niacin sodium in Water for Injection, made with the aid of Sodium Carbonate or Sodium Hydroxide. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of C₆H₅NO₂.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Niacin RS

Identification—To a volume of Injection, equivalent to about 100 mg of niacin, add 0.3 mL of 3 N hydrochloric acid, evaporate, if necessary, on a steam bath to about 2 mL, and allow to stand for 1 hour in a cool place. Filter by suction, wash with small volumes of ice-cold water until the last washing does not give a reaction for chloride, and dry at 105° for 1 hour: the niacin so obtained responds to *Identification* tests A and B under *Niacin*.

Bacterial Endotoxins Test (85)—It contains not more than 3.5 USP Endotoxin Units per mg of niacin.

pH (791): between 4.0 and 6.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Proceed with Injection as directed for *Niacin* or *Niacinamide Assay* (441), *Chemical Method*, using *Standard Niacin Preparation* as the *Standard Preparation* in the *Assay Procedure*, and the following as the *Assay Preparation*. Transfer an accurately measured volume of Injection, equivalent to about 50 mg of niacin, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 200-mL volumetric flask, dilute with water to volume, and mix. Calculate the quantity, in mg, of $C_6H_5NO_2$ in each mL of the Injection taken by the formula:

$$(50 / V)(A_U / A_S)$$

in which *V* is the volume, in mL, of Injection taken.

Niacin Tablets

DEFINITION

Niacin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of niacin ($C_6H_5NO_2$).

IDENTIFICATION• **A. INFRARED ABSORPTION** (197M)

Sample: Heat a portion of finely powdered Tablets, equivalent to 500 mg of niacin, with 25 mL of alcohol on a steam bath for a few min. Filter, and wash the residue with a few mL of hot alcohol. To the filtrate add 30 mL of water, and evaporate to 25 mL on the steam bath. Cool, filter if insoluble matter separates, and evaporate the filtrate to 10 mL. Cool, and place in a refrigerator for 1 h. Filter the separated niacin with suction, wash it with a few mL of cold alcohol, and dry at 105° for 1 h.

Acceptance criteria: Meet the requirements

• **B. ULTRAVIOLET ABSORPTION** (197U)

Medium: 6.8 mg/mL of monobasic potassium phosphate in water, adjusted to a pH of 7.0 with 50% sodium hydroxide solution

Sample solution: 20 µg/mL in *Medium* from the *Sample* obtained in the *Identification* test A

Acceptance criteria: Meets the requirements in the chapter. The A_{237}/A_{262} ratio is 0.46–0.50.

• **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.**ASSAY**• **PROCEDURE**

Solution A: 5-mM solution of sodium 1-hexanesulfonate in water

Mobile phase: Methanol, acetonitrile, glacial acetic acid, and *Solution A* (14:7:1:78)

Standard solution: 0.050 mg/mL of USP Niacin RS in water. Dissolve with the aid of heat in a steam bath.

Sample solution: Transfer an equivalent to 500 mg of Niacin from NLT 20 finely powdered Tablets to a suitable flask. Add 50 mL of water, and heat on a steam bath for 30 min. Sonicate for 2 min, shake by mechanical means for 15 min, and cool to room temperature. Dilute with water to 0.050 mg/mL, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 262 nm

Column: 4-mm × 30-cm; packing L1

Flow rate: 1.3 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1000 theoretical plates for the analyte peak

Tailing factor: NMT 2.0 for the analyte peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 60 min

Standard solution: 0.02 mg/mL of USP Niacin RS in the *Medium*

Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Maximum at about 260 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the concentration of niacin in the *Sample solution* in comparison with the *Standard solution*.

Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) dissolved:

$$\text{Result} = (C \times D \times V/L) \times 100$$

C = determined concentration of niacin in the *Sample solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 65% (Q) of the labeled amount of niacin ($C_6H_5NO_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**
USP Niacin RS

Niacin Extended-Release Tablets

DEFINITION

Niacin Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of niacin ($C_6H_5NO_2$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Diluent: Methanol and water (82:18)

Mobile phase: Methanol and water (82:18), adjusted with glacial acetic acid to a pH of 3.15 ± 0.05

Standard solution: 250 μ g/mL of USP Niacin RS, 50 μ g/mL of USP 6-Hydroxynicotinic Acid RS, and 97.8 μ g/mL of pyridine in *Diluent*

Sample solution: Transfer a quantity of powder, equivalent to 50 mg of niacin from NLT 20 finely powdered Tablets, to a suitable flask, add *Diluent*, and stir for 2 h. Dilute with *Diluent* to a final concentration of 250 μ g/mL of niacin.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L8

Flow rate: 1.0 mL/min

Injection volume: 25 μ L

System suitability

Sample: *Standard solution*

[NOTE—See Table 4 for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between pyridine and 6-hydroxynicotinic acid, and NLT 1.5 between 6-hydroxynicotinic acid and niacin

Relative standard deviation: NMT 3.0% for each of the peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Times: 1, 3, 6, 9, 12, and 20 h; without *Medium* replacement. [NOTE—Withdraw the same volume at each time point.]

Solution A: Solution of sodium heptanesulfonate in acetic acid, methanol, and water (4:44:33:19), w/w¹

Mobile phase: Mixture of methanol, water, and *Solution A* (560:440:25)

Standard solution: USP Niacin RS at a known concentration in water in the range of 75–750 μ g/mL

Sample solution: Filtered portion of the solution under test suitably diluted with *Medium* if necessary

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 15-cm; 10- μ m packing L1

Flow rate: 1.0 mL/min

Injection volume: 15 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Determine, in mg/mL, the content of niacin ($C_6H_5NO_2$) in the *Medium* at each time point:

$$\text{Result} = (r_U/r_S) \times C_S \times D$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*

Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) dissolved at each time point:

At 1 h:

$$\text{Result}_1 = (C_1 \times V/L) \times 100$$

At 3 h:

$$\text{Result}_2 = [C_2 \times (V - V_3) + C_1 \times V_3] \times 100/L$$

At 6 h:

$$\text{Result}_3 = \{C_3 \times [V - 2 \times V_3] + (C_1 + C_2) \times V_3\} \times 100/L$$

At 9 h:

$$\text{Result}_4 = \{C_4 \times [V - 3 \times V_3] + (C_1 + C_2 + C_3) \times V_3\} \times 100/L$$

At 12 h:

$$\text{Result}_5 = \{C_5 \times [V - 4 \times V_3] + (C_1 + C_2 + C_3 + C_4) \times V_3\} \times 100/L$$

At 20 h:

$$\text{Result}_6 = \{C_6 \times [V - 5 \times V_3] + (C_1 + C_2 + C_3 + C_4 + C_5) \times V_3\} \times 100/L$$

C = as C_1, C_2, \dots, C_6 , the content of niacin in the *Medium* at each time point (mg/mL)

V = volume of *Medium*, 900 mL

V_3 = volume of sample withdrawn at each time point (mL)

L = label claim (mg/Tablet)

Tolerances: The percentage of the labeled amount of niacin ($C_6H_5NO_2$) dissolved at the times specified in Tables 1, 2, and 3 conforms to Acceptance Table 2 in Dissolution (711).

Table 1. For Tablets labeled to contain 500 mg or less/Tablet

Time (h)	Amount Dissolved (%)
1	NMT 15

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Acid stage medium: 0.1 N hydrochloric acid; 900 mL
Buffer stage medium: 6.8 g of monobasic potassium phosphate and 0.89 g of sodium hydroxide pellets in 1000 mL of water. Adjust with diluted sodium hydroxide or phosphoric acid to a pH of 6.8; 900 mL.

Apparatus 1: 100 rpm

Times: 1, 4, 12, and 24 h: 1 and 4 h in the *Acid stage medium*; 12 and 24 h in the *Buffer stage medium*. Replace the volume withdrawn with the equal volume of medium preheated to $37 \pm 0.5^\circ$.

Procedure: After 4 h replace the *Acid stage medium* with the *Buffer stage medium*, and run the test for the times specified (additional 20 h for a total of 24 h).

[NOTE—Withdraw the same volume at each time point.

Pass a portion of the solution through a suitable filter.]
Standard stock solution: 0.2 mg/mL of USP Niacin RS in water

Standard solution 1: Dilute *Standard stock solution* with *Acid stage medium* to a final concentration of 0.01 mg/mL of USP Niacin RS.

Standard solution 2: Dilute *Standard stock solution* with *Buffer stage medium* to a final concentration of 0.01 mg/mL of USP Niacin RS.

Sample solution

For Tablets labeled to contain 500 mg: Dilute a filtered portion of the solution under test with appropriate dissolution medium 25-fold.

For Tablets labeled to contain 750 mg: Dilute a filtered portion of the solution under test with appropriate dissolution medium 33-fold.

For Tablets labeled to contain 1000 mg: Dilute a filtered portion of the solution under test with appropriate dissolution medium 50-fold.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 262 nm

Path length: 1 cm

Blank: *Acid stage medium* or *Buffer stage medium*

Analysis

Samples: *Standard solution 1* or *Standard solution 2* and *Sample solution*

Determine the concentration, in mg/mL, of niacin ($C_6H_5NO_2$) in the sample withdrawn from the vessel at each time point:

$$\text{Result} = [(A_U - A_B)/A_S] \times C_S \times D$$

A_U = absorbance of the *Sample solution*

A_B = absorbance of the *Blank*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*

Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) dissolved at each time point:

At 1 h:

$$\text{Result}_1 = (C_1 \times V) \times 100/L$$

At 4 h:

$$\text{Result}_2 = (C_2 \times V + C_1 \times V_3) \times 100/L$$

At 12 h:

$$\text{Result}_3 = [(C_3 + C_2) \times V + C_1 \times V_3] \times 100/L$$

At 24 h:

$$\text{Result}_4 = [(C_4 + C_2) \times V + (C_1 + C_3) \times V_3] \times 100/L$$

C = as C_1, \dots, C_4 , the content of niacin in the related dissolution medium at each time point (mg/mL)

V = volume of *Medium*, 900 mL

V_3 = volume of sample withdrawn at each time point (mL)

L = label claim (mg/Tablet)

Tolerances: The percentage of the labeled amount of niacin ($C_6H_5NO_2$) dissolved at the times specified in *Tables 4* and *5* conforms to *Acceptance Table 2* in *Dissolution* (711).

Table 4. For Tablets labeled to contain 500 mg/Tablet

Time (h)	Amount Dissolved (%)
1	NMT 25
4	30–50
12	65–85
24	NLT 80

Table 5. For Tablets labeled to contain 750 and 1000 mg/Tablet

Time (h)	Amount Dissolved (%)
1	NMT 25
4	30–50
12	55–75
24	NLT 80

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Diluent, Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of 6-hydroxynicotinic acid or pyridine in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of 6-hydroxynicotinic acid or pyridine from the Sample solution

r_S = peak area of 6-hydroxynicotinic acid or pyridine from the Standard solution

C_S = concentration of USP 6-Hydroxynicotinic Acid RS or pyridine in the Standard solution ($\mu\text{g/mL}$)

C_U = nominal concentration of niacin in the Sample solution ($\mu\text{g/mL}$)

Calculate the percentage of any unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of each impurity from the Sample solution

r_S = peak area of niacin from the Standard solution

C_S = concentration of USP Niacin RS in the Standard solution ($\mu\text{g/mL}$)

C_U = nominal concentration of niacin in the Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: See Table 6.

Table 6

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Pyridine	0.14	0.2
6-Hydroxynicotinic acid	0.64	0.2
Niacin	1.0	—
Any unspecified impurity	—	0.1
Total impurities	—	1.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
USP 6-Hydroxynicotinic Acid RS
USP Niacin RS

Niacinamide

$\text{C}_6\text{H}_6\text{N}_2\text{O}$
3-Pyridinecarboxamide;
Nicotinamide [98-92-0].

122.12

DEFINITION

Niacinamide contains NLT 98.5% and NMT 101.5% of niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION (197K)**• **B. ULTRAVIOLET ABSORPTION (197U)**

Sample solution: 20 $\mu\text{g/mL}$ in water

Acceptance criteria: It meets the requirements in the chapter, and the A_{245}/A_{262} ratio is 0.63–0.67.

ASSAY• **PROCEDURE**

Mobile phase: Methanol and 0.005 M sodium 1-heptanesulfonate (30:70)

Standard solution: Transfer 50 mg of USP Niacinamide RS to a 100-mL volumetric flask. Add 3 mL of water to dissolve, and dilute with Mobile phase to volume. Dilute with Mobile phase to 0.04 mg/mL.

Niacin standard solution: Prepare as directed in the Standard solution, using USP Niacin RS instead of USP Niacinamide RS.

Sample solution: Prepare as directed in the Standard solution, using Niacinamide instead of USP Niacinamide RS.

System suitability solution: Mix equal volumes of the Standard solution and Niacin standard solution.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection size: 20 μL

System suitability

Samples: Standard solution and System suitability solution

Suitability requirements

Resolution: NLT 3.0 between niacin and niacinamide, System suitability solution

Relative standard deviation: NMT 2.0%, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$) in the portion of Niacinamide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the Sample solution

r_S = peak area from the Standard solution

C_S = concentration of USP Niacinamide RS in the Standard solution (mg/mL)

C_U = concentration of Niacinamide in the Sample solution (mg/mL)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES• **RESIDUE ON IGNITION (281):** NMT 0.1%**Delete the following:**

- **HEAVY METALS, Method II (231):** NMT 30 ppm • (Official 1-

Jan-2018)

• **READILY CARBONIZABLE SUBSTANCES (271)**

Sample solution: Dissolve 200 mg of Niacinamide in 5 mL of sulfuric acid.

Acceptance criteria: The Sample solution has no more color than Matching Fluid A.

SPECIFIC TESTS• **MELTING RANGE OR TEMPERATURE (741):** 128°–131°• **LOSS ON DRYING (731):** Dry a sample over silica gel for 4 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
 - USP Niacin RS
 - USP Niacinamide RS

Niacinamide Injection

» Niacinamide Injection is a sterile solution of Niacinamide in Water for Injection. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_6H_6N_2O$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

- USP Niacinamide RS
- USP Endotoxin RS

Identification—Dilute a quantity of the Injection, equivalent to about 200 mg of niacinamide, with water to about 10 mL. Add 1 mL of 2.5 N sodium hydroxide, evaporate on a steam bath to dryness, add 5 mL of water, and similarly evaporate to about 1 mL: during the initial evaporation, the odor of ammonia is perceptible. Neutralize to litmus paper with 3 N hydrochloric acid, add 1 mL of the acid in excess, and place the solution in a refrigerator for 2 hours. Then filter, wash the precipitated niacin with small portions of ice-cold water until free from chloride, and dry at 105° for 1 hour: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Niacinamide RS.

Bacterial Endotoxins Test (85)—It contains not more than 3.5 USP Endotoxin Units per mg of niacinamide.

pH (791): between 5.0 and 7.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*.

Assay—Proceed with Injection as directed for under *Niacin or Niacinamide Assay (441)*, *Chemical Method*, using *Standard Niacinamide Preparation* as the *Standard Preparation* in the *Assay Procedure*, and the following as the *Assay Preparation*. Dilute an accurately measured volume of Injection, equivalent to about 50 mg of niacinamide, with water to 500 mL in a volumetric flask, and mix. Pipet 10 mL of the solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Calculate the quantity, in mg, of $C_6H_6N_2O$ in each mL of the Injection taken by the formula:

$$(50 / V)(A_U / A_S)$$

in which *V* is the volume, in mL, of Injection taken.

Niacinamide Tablets**DEFINITION**

Niacinamide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of niacinamide ($C_6H_6N_2O$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Sample: Extract a quantity of powdered Tablets, equivalent to 500 mg of niacinamide, with two 10-mL portions of alcohol, evaporate the filtered alcohol extracts on a steam bath, and dry at 80° for 2 h.

Acceptance criteria: Meet the requirements

- **B. ULTRAVIOLET ABSORPTION (197U)**

Sample solution: 20 µg/mL of niacinamide in water from the *Sample* obtained in *Identification test A*

Acceptance criteria: Meets the requirements in the chapter. The ratio A_{245}/A_{262} is 0.63–0.67.

ASSAY

- **NIACIN OR NIACINAMIDE ASSAY, Chemical Method (441)**

Standard niacinamide preparation: Prepare as directed in the chapter.

Assay preparation: Transfer an equivalent of 25 mg of niacinamide, from NLT 10 finely powdered Tablets, to a suitable flask. Add 50 mL of water and heat, if necessary, until no more dissolves. Cool, dilute with water to 10 µg/mL, mix, and filter.

Analysis: Proceed as directed in the chapter for *Procedure*.

Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (A_U / A_S) \times (C_S / C_U) \times 100$$

A_U = absorbance of the *Assay preparation*

A_S = absorbance of the *Standard niacinamide preparation*

C_S = concentration of the *Standard niacinamide preparation* (µg/mL)

C_U = nominal concentration of niacinamide in the *Assay preparation* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION, Procedure for a Pooled Sample (711)**

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: Known concentration of USP Niacinamide RS in the *Medium*

Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) dissolved:

$$\text{Result} = (r_U / r_S) \times (C_S \times D \times V / L) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (*Q*) of the labeled amount of niacinamide ($C_6H_6N_2O$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Nicardipine RS

Nicardipine Hydrochloride

$C_{26}H_{29}N_3O_6 \cdot HCl$ 515.99

3,5-Pyridinedicarboxylic acid, 1,4-dihydro-2,6-dimethyl-4-(3-nitrophenyl)-, methyl 2-[methyl(phenylmethyl)amino]ethyl ester, monohydrochloride; 2-(Benzylmethylamino)ethyl methyl 1,4-dihydro-2,6-dimethyl-4-(*m*-nitrophenyl)-3,5-pyridinedicarboxylate monohydrochloride [54527-84-3].

Nicardipine free base

$C_{26}H_{29}N_3O_6$ 479.52
[55985-32-5].

DEFINITION

Nicardipine Hydrochloride contains NLT 98.0% and NMT 102.0% of nicardipine hydrochloride ($C_{26}H_{29}N_3O_6 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (17K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride (191)**
Sample solution: 2.5 mg/mL in methanol
Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Protect all solutions from light.

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust the solution with potassium hydroxide to a pH of 4.8.

Solution A: Acetonitrile and methanol (82:18)

Mobile phase: *Solution A* and *Buffer* (40:60)

System suitability solution: 0.6 mg/mL of USP Nicardipine Hydrochloride RS in *Mobile phase* prepared as follows. To a suitable amount of USP Nicardipine Hydrochloride RS in a suitable volumetric flask add *Mobile phase* to fill about 10% of the volume of the flask, and sonicate for 2 min. Then add 10% hydrogen peroxide solution to fill an additional 10% of the volume of the flask. Allow it to stand for 30 min, then dilute with *Mobile phase* to volume.

Nicardipine Hydrochloride degrades to produce nicardipine pyridine analog, nicardipine dimethyl ester analog, and nicardipine bis analog. Use a freshly prepared sample to avoid further degradation for analysis.

Standard solution: 0.1 mg/mL of USP Nicardipine Hydrochloride RS in *Mobile phase*

Sample solution: 0.1 mg/mL of Nicardipine Hydrochloride in *Mobile phase*. [NOTE—Sonication may be necessary for complete dissolution.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 237 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Column temperature: 35°–40°. [NOTE—To attain resolution, the *Column temperature* may be adjusted instead of the *Mobile phase* composition.]

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nicardipine hydrochloride ($C_{26}H_{29}N_3O_6 \cdot HCl$) in the portion of Nicardipine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of nicardipine from the *Sample solution*

r_s = peak response of nicardipine from the *Standard solution*

C_s = concentration of USP Nicardipine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Nicardipine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Nicotine Transdermal System

» Nicotine Transdermal System contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nicotine ($C_{10}H_{14}N_2$).

Packaging and storage—Preserve in the hermetic, light-resistant, unit-dose pouch.

Labeling—The labeling indicates the *Drug Release Test* with which the product complies.

USP Reference standards (11)—

USP Nicotine Bitartrate Dihydrate RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Drug release (724)—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 1*.

Medium: Phosphoric acid solution (1 in 1000); 250 mL, in a tall-form beaker.

Apparatus 7—Proceed as directed in the chapter, using the transdermal system holder-cylinder (see *Figure 4b*). Center the Transdermal System onto a dry, unused 10-cm × 10-cm piece of Cuprophane dialysis membrane with the adhesive side against the membrane, taking care to eliminate

air bubbles between the membrane and the release surface. Attach the membrane to the cylinder using two Parker O-rings, such that one of the borders of the transdermal system is aligned to the groove and it is wrapped around the cylinder. The filled beakers are weighed and pre-equilibrated to $32.0 \pm 0.3^\circ$, prior to immersing the test sample. Reciprocate at a frequency of about 30 cycles per minute with an amplitude of 2.0 ± 0.1 cm. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium*, weighed and pre-equilibrated to $32.0 \pm 0.3^\circ$. At the end of each release interval, allow the beakers to cool to room temperature, make up for evaporative losses by adding water to obtain the original weight, and mix. This solution is the final *Test solution*.

Times: 2, 12, and 24 hours.

Determine the amount of $C_{10}H_{14}N_2$ released by employing the following method.

Mobile phase—Transfer 0.2 mL of *N,N*-dimethyloctylamine to a 1-L volumetric flask, add 220 mL of acetonitrile, and mix. Add 300 mL of water, 0.2 mL of glacial acetic acid, 0.20 g of anhydrous sodium acetate, and 0.55 g of sodium 1-dodecanesulfonate, and dilute with water to volume. Mix for 1 hour until clear. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Equilibration of the column may take as long as 3 hours.]

Standard solution—Dissolve an accurately weighed quantity of USP Nicotine Bitartrate Dihydrate RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of about 0.142 mg of nicotine bitartrate per mL (or 0.046 mg nicotine as free base per mL). [NOTE—About 80 mL of this solution is required in order to prepare the *System suitability solution*.]

System suitability solution—Transfer 8 mg (free base) of nicotine to a 100-mL volumetric flask, and dissolve in 10 mL of acetonitrile. Add 5 mL of 30% hydrogen peroxide, and allow 15 minutes to react. Dilute with *Medium* to volume, and mix. Transfer 20 mL of this solution to a 100-mL volumetric flask, dilute with *Standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between nicotine and any degradation peaks is not less than 1.1; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 50 μ L) of filtered portions of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified below, conforms to *Acceptance Table 1*.

Time (hours)	Amount dissolved
0–2	between 31% and 87%
2–12	between 62% and 191%
12–24	between 85% and 261%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2*.

Phosphate buffer—Dissolve 40.0 g of sodium chloride, 1.0 g of potassium chloride, 8.66 g of dibasic sodium phosphate, and 1.0 g of monobasic potassium phosphate in 5 L of water.

Medium: Phosphate buffer; 500 mL.

Apparatus 6: 50 rpm, double-sided tape being used to attach the Transdermal System to the cylinder.

Times: 6 and 24 hours.

Determine the amount of $C_{10}H_{14}N_2$ released by employing the following method.

Mobile phase—Proceed as directed in the *Assay*.

System suitability solution—Transfer 1.0 mL of the *System suitability solution*, prepared as directed in the *Assay*, to a 100-mL volumetric flask, dilute with *Medium* to volume, and mix.

Standard solution—Pipet 6.0 mL of the *Standard preparation*, prepared as directed in the *Assay*, into a 50-mL volumetric flask, dilute with *Medium* to volume, and mix. Dilute quantitatively and stepwise with *Medium* to obtain an appropriate final concentration.

Test solution—At each of the test times, withdraw a 2-mL aliquot of the solution under test. [NOTE—Replace the aliquots withdrawn for analysis with fresh portions of *Medium*.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm \times 12.5-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution* used for the 6-hour interval, and record the peak responses as directed for *Procedure*: the resolution, *R*, between 4,4'-dipyridyl and nicotine is not less than 5.0; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 μ L) of the filtered portion of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to *Acceptance Table 1*.

Time (hours)	Amount dissolved
6	between 71% and 157%
24	between 156% and 224%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.

Medium: water; 900 mL.

Apparatus 5: 50 rpm, the stainless steel disk assembly being replaced with a 5-cm watch glass for an 11-mg Transdermal System and an 8-cm watch glass for a 22-mg Transdermal System.

Times: 1, 2, and 4 hours.

Standard solution—Prepare a solution of USP Nicotine Bitartrate Dihydrate RS in water having a known concentration of nicotine similar to that of the solution under test.

Procedure—Determine the amount of $C_{10}H_{14}N_2$ released by employing UV absorption at the wavelength of maximum absorbance at about 259 nm, in comparison with the *Standard solution*, using water as the blank.

Tolerances—The amount of $C_{10}H_{14}N_2$ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to the following *Acceptance Table*.

Time (hours)	Amount dissolved
1	between 35% and 75%
2	between 55% and 95%
4	not less than 73%

Acceptance Table

Level	Tested	Criteria
L ₁	6	No individual value lies outside each of the stated ranges and no individual value is less than the stated amount at the final test time.
L ₂	6	The average value of the 12 units (L ₁ + L ₂) lies within each of the stated ranges and is not less than the stated amount at the final test time; none is more than 5% of the labeled content outside each of the stated ranges; and none is more than 5% of the labeled content below the stated amount at the final test time.
L ₃	12	The average value of the 24 units (L ₁ + L ₂ + L ₃) lies within each of the stated ranges and is not less than the stated amount at the final test time; not more than 2 of the 24 units are more than 5% of labeled content outside each of the stated ranges; not more than 2 of the 24 units are more than 5% of the labeled content below the stated amount at the final test time; and none of the units is more than 10% of the labeled content outside each of the stated ranges or more than 10% of the labeled content below the stated amount at the final test time.

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 4*.

Medium: 0.025 N hydrochloric acid; 600 mL.

Apparatus 5: 50 rpm, a convex screen being used to hold the Transdermal System in position during testing.

Times: 4 and 16 hours.

Standard solution and Procedure—Proceed as directed under Test 3.

Tolerances—The amount of C₁₀H₁₄N₂ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to Acceptance Table 1.

Time (hours)	Amount dissolved
4	between 36% and 66%
16	between 72% and 112%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 5*.

Phosphate buffer, Medium, and Apparatus—Proceed as directed under Test 2.

Times: 3, 6, and 24 hours.

Mobile phase—Proceed as directed in the Assay.

System suitability solution, Standard solution, Test solution, and Chromatographic system—Proceed as directed under Test 2.

Procedure—Proceed as directed under Test 2 except to inject about 30 μ L.

Tolerances—The amount of C₁₀H₁₄N₂ released, as a percentage of the labeled amount of the dose absorbed in vivo, at the times specified, conforms to Acceptance Table 1.

Time (hours)	Amount dissolved
3	between 79% and 112%
6	between 108% and 141%
24	between 156% and 202%

Uniformity of dosage units (905): meets the requirements.

Assay—

Mobile phase—Mix 300 mL of acetonitrile, 700 mL of water, and 1 mL of triethylamine, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Nicotine Bitartrate Dihydrate RS in water to obtain a stock solution having a known concentration of about 26.87 mg per mL. Quantitatively dilute a volume of the stock solution with methanol to obtain a solution having a known concentration of about 5.37 mg of USP Nicotine Bitartrate Dihydrate RS per mL. [NOTE—This solution contains 1.75 mg of nicotine per mL.]

System suitability solution—Transfer about 8 mg of 4,4'-dipyridyl to a 25-mL volumetric flask, add 5.0 mL of the *Standard preparation*, dilute with methanol to volume, and mix.

Assay preparation—Cut an accurately counted number of Transdermal Systems, equivalent to about 175 mg of nicotine, based on the label claim, into strips 5 cm² in area. Remove the protective liners, if any, from the strips, and discard. Transfer the strips to a 250-mL flask, and add 100.0 mL of methanol. Insert the stopper into the flask, and shake by mechanical means for about 3 hours. Filter, and use the clear filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm \times 25-cm column containing packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between nicotine and 4,4'-dipyridyl is not less than 5.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percent label claim of nicotine (C₁₀H₁₄N₂) in each Transdermal System taken by the formula:

$$100(162.23/462.41)(C_S / C_U)(r_U / r_S)$$

in which 162.23 and 462.41 are the molecular weights of nicotine and anhydrous nicotine bitartrate, respectively; *C_S* is the concentration, in mg per mL, of USP Nicotine Bitartrate Dihydrate RS in the *Standard preparation*; *C_U* is the nominal concentration of nicotine in the *Assay preparation*, based on the label claim; and *r_U* and *r_S* are the nicotine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nicotine Polacrilex

[(C₄H₆O₂)_x(C₁₀H₁₀)_y](C₁₀H₁₄N₂)

2-Propenoic acid, 2-methyl-, polymer with diethenylbenzene, complex with (S)-3-(1-methyl-2-pyrrolidinyl)pyridine;

Methacrylic acid polymer with divinylbenzene, complex with nicotine [96055-45-7].

DEFINITION

Change to read:

Nicotine Polacrilex is a weak carboxylic cation-exchange resin prepared from methacrylic acid and divinylbenzene, in complex with nicotine. It contains NLT 95.0% and NMT 115.0% of the labeled amount of nicotine ($C_{10}H_{14}N_2$), calculated on the Δ dried Δ_{USP40} basis.

Δ [NOTE—Nicotine Polacrilex is also known as Nicotine Resinate.] Δ_{USP40}

IDENTIFICATION

Change to read:

- **A. INFRARED ABSORPTION** Δ (197) **FOR NICOTINE:** [NOTE—Methods described in (197K) or (197A) may be used.] Δ_{USP40}

Sample: Transfer an amount of Nicotine Polacrilex equivalent to 100 mg of nicotine to a 100-mL glass-stoppered tube. Add 20 mL of 1 M ammonium hydroxide, 5 mL of 10 M sodium hydroxide, and 20 mL of *n*-hexane. Shake for 5 min, and allow the phases to separate. Transfer the upper hexane phase to an evaporating dish, and evaporate on a steam bath.

Standard: Use USP Nicotine Bitartrate Dihydrate RS, and prepare as directed for the *Sample*.

Acceptance criteria: Meets the requirements

Change to read:

- **B. INFRARED ABSORPTION** Δ (197) **FOR POLACRILEX:** [NOTE—Methods described in (197K) or (197A) may be used.] Δ_{USP40}

Standard: Transfer a portion of USP Polacrilex Resin RS, equivalent to the amount of Nicotine Polacrilex used to prepare the *Sample solution* in the *Assay*, to a glass-stoppered tube. Add 10 mL of 1 M ammonium hydroxide, shake for 10 min, then centrifuge. Decant the ammonia solution from the residue, and wash the residue by shaking it with three 10-mL volumes of water, decanting the water phase after each shaking. Wash with 10 mL of 0.1 N hydrochloric acid, decant the liquid, and dry the residue at 105°.

Sample: Use the residue obtained from the *Sample solution* in the *Assay*. Decant the ammonia solution remaining from the residue, and wash the residue by shaking it with three 10-mL volumes of water, decanting the water phase after each shaking. Wash with 10 mL of 0.1 N hydrochloric acid, decant the liquid, and dry the residue at 105°.

Acceptance criteria: Meets the requirements

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

• PROCEDURE

Solution A: Add 25 mL of 1 M acetic acid to 900 mL of water, then add 6 mL of ammonium hydroxide. Adjust with either 2 M acetic acid or 2 M ammonium hydroxide to a pH of 10.0, and dilute with water to 1000 mL.

Solution B: Acetonitrile

Mobile phase: See Table 1. Δ [NOTE—Re-equilibration time may be adjusted, if necessary.]

Δ_{USP40}

System suitability solution: 1.5 mg/mL of USP Nicotine Bitartrate Dihydrate RS and 6 μ g/mL of USP Nicotine Related Compound G RS in water

Standard solution: 1.8 mg/mL of USP Nicotine Bitartrate Dihydrate RS in water

Sample solution: Nominally 0.6 mg/mL of nicotine prepared as follows. Transfer an amount of Nicotine Polacrilex equivalent to 30 mg of nicotine to a glass-stoppered tube. Add 10.0 mL of 1 M ammonium hydroxide, shake vigorously for 10 min, then centrifuge. Transfer 5.0 mL of the clear solution to a 25-mL volumetric flask, add 5 mL of 1 M acetic acid, and dilute with water to volume. Retain the residue from centrifugation for use in *Identification B*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Resolution: NLT 2.5 between nicotine and nicotine related compound G, *System suitability solution*

Tailing factor: NMT 2.0 for nicotine, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nicotine ($C_{10}H_{14}N_2$) in the portion of Nicotine Polacrilex taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of nicotine from the *Sample solution*

r_S = peak response of nicotine from the *Standard solution*

C_S = concentration of USP Nicotine Bitartrate Dihydrate RS on the anhydrous basis in the *Standard solution* (mg/mL)

C_U = nominal concentration of nicotine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of nicotine, 162.23

M_{r2} = molecular weight of anhydrous nicotine bitartrate, 462.41

Acceptance criteria: 95.0%–115.0% on the Δ dried Δ_{USP40} basis

IMPURITIES

• ORGANIC IMPURITIES

Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability solution: 1.5 mg/mL of USP Nicotine Bitartrate Dihydrate RS and 6 μ g/mL each of USP

Nicotine Related Compound A RS, USP Nicotine Related Compound B RS, USP Nicotine Related Compound C RS, USP Nicotine Related Compound D RS, USP Nicotine Related Compound E RS, USP Nicotine Related Compound F RS, and USP Nicotine Related Compound G RS in water. [NOTE—The concentration of each related compound is in terms of the free base.]

Standard solution: 1.8 µg/mL of USP Nicotine Bitartrate Dihydrate RS in water

Sensitivity solution: 0.9 µg/mL of USP Nicotine Bitartrate Dihydrate RS in water from the *Standard solution*

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Resolution: NLT 2.5 between nicotine and nicotine related compound G, *System suitability solution*

Tailing factor: NMT 2.0 for nicotine, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of Nicotine Polacrilex taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of nicotine from the *Standard solution*

C_S = concentration of USP Nicotine Bitartrate Dihydrate RS on the anhydrous basis in the *Standard solution* (mg/mL)

C_U = nominal concentration of nicotine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of nicotine, 162.23

M_{r2} = molecular weight of anhydrous nicotine bitartrate, 462.41

Acceptance criteria: See Table 2. Disregard peaks that are less than 0.05% of the nicotine peak.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Nicotine related compound E	0.3	0.3
Nicotine related compound C	0.55	0.3
Nicotine related compound F	0.7	0.3
Nicotine related compound A	0.8	0.3
Nicotine related compound D	0.86	0.3
Nicotine related compound G	0.9	0.3
Nicotine	1.00	—
Nicotine related compound B	1.6	0.3
Any other unspecified impurity	—	0.10
Total impurities	—	0.8

SPECIFIC TESTS

Delete the following:

▲ WATER DETERMINATION, Method I (921)

Sample solution: Transfer about 1.0 g of Nicotine Polacrilex to a 50-mL glass-stoppered test tube, and add 20.0 mL of methanol. Shake for 30 min, and allow to stand for 30 min. Use a 10-mL portion of the methanol layer for the titration.

Acceptance criteria: NMT 5.0% ▲USP40

Add the following:

▲ LOSS ON DRYING (731)

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 7.0% ▲USP40

Change to read:

• NICOTINE RELEASE

Solution A: 9 mg/mL of sodium chloride in water

Sample stock solution: Transfer an amount of Nicotine Polacrilex equivalent to 4 mg of nicotine to a glass-stoppered tube, add 10.0 mL of *Solution A* that has been warmed to 37°, and shake by mechanical means for 10 min. Immediately pass the liquid through a dry filter paper, discarding the first mL of the filtrate.

Sample solution: Transfer 1.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.

Instrumental conditions

▲(See *Ultraviolet-Visible Spectroscopy* (857).) ▲USP40

Mode: UV

Analytical wavelengths: 236, 259, and 282 nm

Blank: 1.0 mL of *Solution A* diluted with 0.1 N hydrochloric acid to 25 mL

Analysis

Samples: *Sample solution* and *Blank*

Calculate the percentage of nicotine released:

$$\text{Result} = (A_{259} - 0.5A_{236} - 0.5A_{282}) \times (V/E) \times (F/W) \times (1/P) \times 100$$

A_{259} = absorbance of the *Sample solution*, corrected for the *Blank* absorbance, at a wavelength of 259 nm

A_{236} = absorbance of the *Sample solution*, corrected for the *Blank* absorbance, at a wavelength of 236 nm

A_{282} = absorbance of the *Sample solution*, corrected for the *Blank* absorbance, at a wavelength of 282 nm

V = dilution volume, 250 mL

E = specific absorbance of nicotine at a wavelength of 259 nm, 323 ▲mL g⁻¹ cm⁻¹

▲USP40

F = unit conversion factor, 1000 mg/g

W = weight of Nicotine Polacrilex (mg)

P = percentage of nicotine in Nicotine Polacrilex determined in the *Assay*

Acceptance criteria: NLT 70% in 10 min

Nicotine Polacrilex Gum

» Nicotine Polacrilex Gum contains an amount of Nicotine Polacrilex $[(C_4H_6O_2)_x(C_{10}H_{10})_y](C_{10}H_{14}N_2)$ equivalent to not less than 90 percent and not more than 120 percent of the labeled amount of nicotine ($C_{10}H_{14}N_2$).

USP Reference standards (11)—

USP Nicotine Bitartrate Dihydrate RS
USP Polacrilex Resin RS

Identification—

A: Developing solvent—Prepare a mixture of chloroform, acetone, and diethylamine (40:5:5).

Test solution—Cut several pieces of Gum into small pieces with scissors, and weigh. Transfer a portion of the Gum, equivalent to about 4 mg of nicotine, to a centrifuge tube. Add 5 mL of chloroform, sonicate for about 30 minutes to dissolve the nicotine, and centrifuge for about 10 minutes. Cool to about 15°, and add two 3-mL portions of 0.5 N hydrochloric acid with gentle mixing, and release excess pressure if necessary. Mix the contents of the tube by shaking, and centrifuge the mixture for about 10 minutes. Transfer 5 mL of the upper aqueous layer to a separatory funnel, and adjust with 0.5 N sodium hydroxide solution to a pH greater than 10.0. Add 3 mL of chloroform, and shake gently. Use the chloroform layer as the *Test solution*.

Standard solution—Transfer 10 mg of USP Nicotine Bitartrate Dihydrate RS to a separatory funnel, add 10 mL of water, and mix to dissolve. Adjust with 0.5 N sodium hydroxide to a pH greater than 10.0. Add 3 mL of chloroform, with gentle shaking, and use the chloroform layer as the *Standard solution*.

Procedure—Separately apply 10 μ L each of the *Test solution* and the *Standard solution* about 1.5 cm from the lower edge of a thin-layer chromatographic plate (see *Chromatography* (621)). Air-dry, place the plate in a chromatographic tank that has been saturated with *Developing solvent*, and develop the chromatogram until the solvent front has moved about 7 cm. Remove the plate from the chamber, and allow to air-dry. Examine the plate under short-wave-length UV light: the R_f value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution* (presence of nicotine).

B: Infrared Absorption (197K)—Use USP Polacrilex Resin RS and a test specimen prepared as follows. Cut a piece of

Gum into small pieces with scissors. Place the pieces in a 50-mL centrifuge tube, add about 20 mL of *n*-hexane, and place in an ultrasonic bath for about 30 minutes. Centrifuge at about 2500 rpm for about 5 minutes. Decant the hexane phase, and add 10 mL of 2 N hydrochloric acid. Shake the tube carefully, and open the stopper slightly to relieve any excess pressure. Add 10 mL of alcohol, and shake the tube carefully with the stopper slightly open. Centrifuge again as described above, and decant the liquid, taking care to avoid contamination of the precipitate with the gum material. Add 1 mL to 3 mL of water, mix gently to resuspend the precipitate, and filter. Wash the residue on the filter with water and then with alcohol. Dry the filter and residue at about 105° for 1 hour (presence of polacrilex).

Uniformity of dosage units (905): meets the requirements.

Assay—

Acetate buffer—Prepare a mixture containing 13.6 g of sodium acetate and 57.2 mL of glacial acetic acid in 1000 mL of water.

Solvent—Prepare a mixture of water, acetonitrile, 0.25 M sodium 1-decanesulfonate, and *Acetate buffer* (785:150:40:25).

Mobile phase—Prepare a mixture containing water, acetonitrile, *Acetate buffer*, and 0.25 M sodium 1-decanesulfonate (685:200:75:40).

Standard preparation—Dissolve an accurately weighed quantity of USP Nicotine Bitartrate Dihydrate RS in *Solvent* to obtain a *Standard stock solution* having a known concentration of about 1.25 mg per mL. Dilute a volume of this solution quantitatively with *Solvent* to obtain a *Standard preparation* having a known concentration of about 125 μ g per mL (40 μ g of nicotine per mL).

Assay preparation—Place one piece of Gum, accurately weighed, in a stoppered flask, add about 50 mL of *n*-hexane, and transfer 50.0 mL of *Solvent*. Add a stirring bar, insert the stopper in the flask, and stir vigorously for about 30 minutes or until the test specimen has been dispersed. Remove from the stirring mechanism, and allow to stand for about 30 minutes or until the phases have separated. Remove an aliquot of the lower layer, taking care not to remove a large quantity of the insoluble excipients, and filter, discarding the first few mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm \times 30-cm stainless steel column containing packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, record the chromatograms, and measure the peak responses as directed for *Procedure*: the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Perform the following procedure on 10 individual pieces of Gum, and use the average of the calculated values as the assay value. Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 50 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of nicotine ($C_{10}H_{14}N_2$) in the Gum taken by the formula:

$$50C(162.23 / 462.41)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Nicotine Bitartrate Dihydrate RS on the anhydrous basis in the *Standard preparation*, 162.23 and 462.41 are the molecular weights of nicotine and anhydrous nicotine bitartrate, respectively, and r_U and r_S are peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nifedipine

$C_{17}H_{18}N_2O_6$ 346.33
3,5-Pyridinedicarboxylic acid, 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)-, dimethyl ester;
Dimethyl 1,4-dihydro-2,6-dimethyl-4-(o-nitrophenyl)-3,5-pyridinedicarboxylate [21829-25-4].

DEFINITION

Nifedipine contains NLT 98.0% and NMT 102.0% of nifedipine ($C_{17}H_{18}N_2O_6$), calculated on the dried basis. [NOTE—Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenylpyridine derivative. Exposure to UV light leads to the formation of a nitrophenylpyridine derivative. Perform the Assay and other tests in the dark or under golden fluorescent or other low-actinic light. Use low-actinic glassware.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Do not dry samples.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Protect the *Standard solution* and the *Sample solution* from actinic light. Conduct the Assay promptly after preparation of the *Standard solution* and the *Sample solution*.

Mobile phase: Acetonitrile, methanol, and water (25:25:50)

Standard stock solution: 1 mg/mL of USP Nifedipine RS in methanol

Standard solution: 0.1 mg/mL in *Mobile phase* from *Standard stock solution*

Sample solution: 0.1 mg/mL of Nifedipine prepared as follows. Transfer about 25 mg of Nifedipine to a 250-mL flask, dissolve in 25 mL of methanol, and dilute with *Mobile phase* to volume.

Chromatographic system
(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nifedipine ($C_{17}H_{18}N_2O_6$) in the portion of Nifedipine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Nifedipine RS in the *Standard solution* (mg/mL)

C_U = concentration of Nifedipine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%, an ignition temperature of 600° being used

Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm (Official 1-Jan-2018)

ORGANIC IMPURITIES

Protect *Standard stock solution B* and the *Sample solution* from actinic light. Conduct this test promptly after preparation of *Standard stock solution B* and the *Sample solution*.

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard stock solution A: 1 mg/mL of USP Nifedipine RS in methanol

Standard solution A: 0.3 mg/mL of USP Nifedipine RS in *Mobile phase* from *Standard stock solution A*

Standard stock solution B: 1 mg/mL of USP Nifedipine Nitrophenylpyridine Analog RS in methanol

Standard solution B: 0.6 μg/mL of USP Nifedipine Nitrophenylpyridine Analog RS in *Mobile phase* from *Standard stock solution B*

Standard stock solution C: 1 mg/mL of USP Nifedipine Nitrosophenylpyridine Analog RS in methanol

Standard solution C: 0.6 μg/mL of USP Nifedipine Nitrosophenylpyridine Analog RS from *Standard stock solution C*, diluted with *Mobile phase*

Standard solution D: *Mobile phase*, *Standard solution B*, and *Standard solution C* (1:1:1)

System suitability solution: *Standard solution A*, *Standard solution B*, and *Standard solution C* (1:1:1)

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between nifedipine nitrophenylpyridine analog and nifedipine nitrosophenylpyridine analog; NLT 1.0 between the nifedipine nitrosophenylpyridine analog and nifedipine

Relative standard deviation: NMT 10% for both nifedipine nitrophenylpyridine analog and nifedipine nitrosophenylpyridine analog

Analysis

Samples: *Sample solution* and *Standard solution D*

Calculate the percentage of nifedipine nitrophenylpyridine analog and nifedipine nitrosophenylpyridine analog in the portion of Nifedipine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of nifedipine nitrophenylpyridine analog or nifedipine nitrosophenylpyridine analog from the *Sample solution*
 r_S = peak response of nifedipine nitrophenylpyridine analog or nifedipine nitrosophenylpyridine analog from *Standard solution D*
 C_S = concentration of USP Nifedipine Nitrophenylpyridine Analog RS or USP Nifedipine Nitrosophenylpyridine Analog RS in *Standard solution D* (mg/mL)
 C_U = concentration of Nifedipine in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Nifedipine nitrophenylpyridine analog ^a	0.8	0.2
Nifedipine nitrosophenylpyridine analog ^b	0.9	0.2
Nifedipine	1.0	—

^a Dimethyl 4-(2-nitrophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.^b Dimethyl 4-(2-nitrosophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.**• LIMIT OF CHLORIDE AND SULFATE**

Standard solution A: Add 5.0 mL of water to 10 mL of 8.2 µg/mL of sodium chloride (corresponding to 5 µg/mL of chloride).

Standard solution B: Equivalent to 10 µg/mL of sulfate from potassium sulfate in water.

Sample solution: To 5.0 g of Nifedipine add 4.0 mL of 6 N acetic acid and 46 mL of water. Bring carefully to a boil on a hot plate. Cool, pass through filter paper that is free of chloride and sulfate, and use the filtrate.

Chloride: Pipet 2.5 mL of the *Sample solution* into a 50-mL color-comparison tube, and add 12.5 mL of water. Into a matched color-comparison tube, pipet 10 mL of *Standard solution A*. To each tube add 0.15 mL of 0.3 M nitric acid and 0.3 mL of silver nitrate TS, and mix.

Acceptance criteria: NMT 0.02%; the opalescence exhibited by the *Sample solution* does not exceed that of *Standard solution A*.

Sulfate: Pipet into each of two 50-mL matched color-comparison tubes 1.5 mL of *Standard solution B*. To each tube add, successively and with continuous shaking, 0.75 mL of alcohol, 0.5 mL of a 6.1% aqueous solution of barium chloride, and 0.25 mL of 6 N acetic acid. Shake for an additional 30 s. Pipet into one tube, designated the standard tube, 15 mL of *Standard solution B*. Pipet into the other tube, designated the sample tube, 3 mL of *Sample solution* and 12 mL of water.

Acceptance criteria: NMT 0.05%; the turbidity exhibited by the *Sample solution* in the sample tube does not exceed that of *Standard solution B* in the standard tube.

• PERCHLORIC ACID TITRATION

Sample solution: Dissolve 4 g of Nifedipine in 160 mL of glacial acetic acid in a 250-mL conical flask with the aid of an ultrasonic bath.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint: Visual

Analysis: Add 3 drops of *p*-naphtholbenzein TS to the *Sample solution*, and titrate with *Titrant* to a green endpoint.

Acceptance criteria: NMT 0.12 mL of 0.1 N perchloric acid is consumed for each g of Nifedipine.

SPECIFIC TESTS**• LOSS ON DRYING (731)**

Analysis: Dry a sample at 105° to constant weight.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Nifedipine RS

USP Nifedipine Nitrophenylpyridine Analog RS

Dimethyl 4-(2-nitrophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

C₁₇H₁₆N₂O₆ 344.33

USP Nifedipine Nitrosophenylpyridine Analog RS

Dimethyl 4-(2-nitrosophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

C₁₇H₁₆N₂O₅ 328.33

Nifedipine Capsules**DEFINITION**

Nifedipine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of nifedipine (C₁₇H₁₆N₂O₆).

Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenylpyridine derivative. Exposure to UV light leads to the formation of a nitrophenylpyridine derivative. Perform assays and tests in the dark or under golden fluorescent or other low-actinic light. Use low-actinic glassware.

IDENTIFICATION**• A.**

Standard solution: 1.2 mg/mL of USP Nifedipine RS in methylene chloride

Sample solution: Using the technique described in *Procedure for content uniformity* in the test for *Uniformity of Dosage Units* transfer the contents of 3 Capsules to a centrifuge tube, rinsing the scissors with 20 mL of 0.1 N sodium hydroxide. Pipet 25 mL of methylene chloride into the tube, insert a stopper, invert several times, and carefully release the pressure in the tube. Insert the stopper again tightly, and shake gently for 1 h. Centrifuge the tube for 10 min at 2000–2500 rpm. Remove the supernatant aqueous phase by aspiration with a syringe, and transfer 5.0 mL of the clarified lower layer to a suitable vial.

Mixed solution: Mixture of *Standard solution* and *Sample solution* (1:1)

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture

Application volume: 500 µL

Developing solvent system: Ethyl acetate and cyclohexane (1:1)

Spray reagent stock solution: Dissolve 3 g of bismuth subnitrate and 30 g of potassium iodide, taken in a 100-mL volumetric flask, in 10 mL of 3 N hydrochloric acid, and dilute with water to volume.

Spray reagent: Before use, mix 10 mL of *Spray reagent stock solution* in a 100-mL volumetric flask with 10 mL of 3 N hydrochloric acid, and dilute with water to volume.

Analysis

Samples: *Standard solution*, *Sample solution*, and *Mixed solution*

Allow the spots to dry, and develop the chromatogram, protected from light, in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry the plate until no odor is detectable. Immediately view the plate under short-wavelength UV light, note the colored bands, and then spray the plate with *Spray reagent*.

Acceptance criteria: Each solution exhibits a dark blue major band at the same *R_f* value of 0.3 before the treatment with *Spray reagent*, and each solution exhibits a compact light orange band on a yellow background after the treatment with *Spray reagent*.

• B. The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE:** Protect the *Standard solution* and the *Sample solution* from actinic light. Conduct the Assay promptly after preparation of the *Standard solution* and the *Sample solution*.

Mobile phase: Acetonitrile, methanol, and water (25:25:50)

Standard stock solution: 1 mg/mL of USP Nifedipine RS in methanol

Standard solution: 0.1 mg/mL of USP Nifedipine RS in *Mobile phase* from *Standard stock solution*

Sample solution: 0.1 mg/mL of nifedipine prepared as follows. Transfer the contents of 5 Capsules with the aid of a small amount of methanol to a suitable volumetric flask, and dilute with *Mobile phase* to volume. Pass through a solvent-resistant filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Columns

Guard: Packing L1

Analytical: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nifedipine from the *Sample solution*

r_S = peak response of nifedipine from the *Standard solution*

C_S = concentration of USP Nifedipine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of nifedipine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: Simulated gastric fluid TS (without pepsin); 900 mL

Apparatus 2: 50 rpm

Time: 20 min

Standard solution: Dissolve a quantity of USP Nifedipine RS in an amount of methanol not exceeding 2% of the final volume, and dilute with *Medium* to obtain a solution of a known suitable concentration.

Sample solution: Pass a portion of solution under test through a suitable filter, and dilute as needed with *Medium*, in comparison with the *Standard solution*. Filters must be checked for absorptive loss of nifedipine.

Instrumental conditions

Mode: UV

Analytical wavelength: 340 nm

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the percentage of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved by using UV absorbances at the specified wavelength.

Tolerances: NLT 80% (Q) of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905)**Procedure for content uniformity**

Standard solution: 50 μg/mL of USP Nifedipine RS in methanol

Sample solution: With the point of a pair of sharp scissors, make a small hole at the end of 1 Capsule. Squeeze most of the contents into a 200-mL volumetric flask, cut the Capsule in half, and drop it into the flask. Rinse the scissors with 20 mL of methanol, quantitatively collecting the rinse in the flask. Dilute with methanol to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 350 nm

Cell: 1 cm

Blank: Methanol

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) in the Capsule taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Nifedipine RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of nifedipine in the *Sample solution* (μg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

- **ORGANIC IMPURITIES:** Protect the *Standard solution* and the *Sample solution* from actinic light. Conduct this test promptly after preparation of the *Standard solution* and the *Sample solution*.

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard stock solution A: 1 mg/mL of USP Nifedipine RS in methanol

Standard solution A: 0.3 mg/mL of USP Nifedipine RS from *Standard stock solution A* in *Mobile phase*

Standard stock solution B: 1 mg/mL of USP Nifedipine Nitrophenylpyridine Analog RS in methanol

Standard solution B: 6 μg/mL of USP Nifedipine Nitrophenylpyridine Analog RS in *Mobile phase* from *Standard stock solution B*

Standard stock solution C: 1 mg/mL of USP Nifedipine Nitrosophenylpyridine Analog RS in methanol

Standard solution C: 1.5 μg/mL of USP Nifedipine Nitrosophenylpyridine Analog RS in *Mobile phase* from *Standard stock solution C*

Standard solution D: Mixture of *Standard solution B*, *Standard solution C*, and *Mobile phase* (1:1:1)

System suitability solution: Mixture of *Standard solution A*, *Standard solution B*, and *Standard solution C* (1:1:1)

Proceed as directed in the Assay.

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between the nifedipine nitrophenylpyridine analog and nifedipine nitrosophenylpyridine analog peaks, and NLT 1.0 between the nifedipine nitrosophenylpyridine analog and nifedipine peaks

Relative standard deviation: NMT 10% for each nifedipine nitrophenylpyridine analog and nifedipine nitrosophenylpyridine analog peaks

Analysis

Samples: *Standard solution D* and *Sample solution*
Calculate the percentage of nifedipine nitrophenylpyridine analog and nifedipine nitrosophenylpyridine analog in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of nifedipine nitrophenylpyridine analog or nifedipine nitrosophenylpyridine analog from the *Sample solution*
 r_S = peak response of nifedipine nitrophenylpyridine analog or nifedipine nitrosophenylpyridine analog from *Standard solution D*
 C_S = concentration of the appropriate USP Nifedipine Nitrophenylpyridine Analog RS or USP Nifedipine Nitrosophenylpyridine Analog RS in *Standard solution D* (mg/mL)
 C_U = nominal concentration of nifedipine in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Nifedipine nitrophenyl analog ^a	0.8	2.0
Nifedipine nitrosophenyl analog ^b	0.9	0.5
Nifedipine	1.0	—

^a Dimethyl 4-(2-nitrophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

^b Dimethyl 4-(2-nitrosophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature between 15° and 25°.

- USP REFERENCE STANDARDS (11)**

USP Nifedipine RS

USP Nifedipine Nitrophenylpyridine Analog RS

Dimethyl 4-(2-nitrophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

$C_{17}H_{16}N_2O_6$ 344.33

USP Nifedipine Nitrosophenylpyridine Analog RS

Dimethyl 4-(2-nitrosophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

$C_{17}H_{16}N_2O_5$ 328.33

Nifedipine Extended-Release Tablets**DEFINITION**

Nifedipine Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$). [NOTE—Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenylpyridine derivative. Exposure to UV light leads to the formation of a nitrophenylpyridine derivative. Perform assays and tests in the dark or under golden fluorescent or other low-actinic light. Use low-actinic glassware.]

IDENTIFICATION

- A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B. ULTRAVIOLET ABSORPTION (197U)**
Standard stock solution and Sample stock solution: Prepare as directed in the *Assay*.

Standard solution: 0.02 mg/mL of USP Nifedipine RS in *Mobile phase* from the *Standard stock solution*

Sample solution: Nominally 0.02 mg/mL of nifedipine in *Mobile phase* from the *Sample stock solution*

ASSAY

- PROCEDURE**

[NOTE—Conduct the *Assay* promptly after preparation of the *Standard solution* and the *Sample solution*.]

Mobile phase: Acetonitrile, methanol, and water (25:25:50)

Standard stock solution: 1 mg/mL of USP Nifedipine RS in methanol

Standard solution: 0.1 mg/mL of USP Nifedipine RS from the *Standard stock solution* in *Mobile phase*

Sample stock solution: Dissolve an amount equivalent to 420 mg of nifedipine from powdered Tablets in 130 mL of water in a 250-mL volumetric flask; or transfer the intact Tablets to a 400-mL, high-speed blender cup containing 130 mL of water. Homogenize until a uniform suspension is achieved (about 2 min), and transfer the suspension with the aid of a mixture of acetonitrile and methanol (1:1) to a 250-mL volumetric flask. Dilute with a mixture of acetonitrile and methanol (1:1) to volume, and stir for 30 min. Centrifuge the resulting suspension to obtain a clear supernatant.

Sample solution: Nominally 0.1 mg/mL of nifedipine prepared as follows. Transfer 3.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and filter. [NOTE—Reserve a portion of this solution for use as the *Sample solution* in the test for *Organic Impurities*.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Columns

Guard: 2.1-mm × 3-cm; packing L1

Analytical: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Nifedipine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of nifedipine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- DISSOLUTION (711)**

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: Water; 50 mL

Apparatus 7: (See *Drug Release* (724).) 15–30 cycles/min. Do not use the reciprocating disk; use a 25-cm plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue. The solution containers are 25-mm test tubes, 150–200 mm in length, and the water bath is maintained at $37 \pm 0.5^\circ$. At the end of each specified test interval, the systems

are transferred to the next row of new test tubes containing 50 mL of fresh *Medium*.

Times: 4, 8, 12, 16, 20, and 24 h

Diluent: Methanol and water (1:1)

Standard solution: Transfer 50 mg of USP Nifedipine RS to a 100-mL volumetric flask. Dissolve in 50 mL of methanol, and dilute with water to volume. Quantitatively dilute this solution with *Diluent* to obtain solutions having suitable known concentrations.

Sample solution: Use portions of the solution under test, passed through a suitable filter of 0.4- μ m pore size, suitably diluted with methanol, and stepwise if necessary, with *Diluent* to obtain a final mixture consisting of equal parts of methanol and water.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 338 nm

Cell: 0.5 cm

Analysis: Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in the *Sample solution* at each 4-h interval from UV absorbances. [NOTE—For the 4-h time period, determine the absorbance at 456 nm, and use this determination to correct for excipient interference.]

Tolerances: See Table 1.

Table 1

Time (h)	Amount Dissolved ^a (%)
4	5–17
8	—
12	43–80
16	—
20	—
24	NLT 80

^a The amount dissolved is expressed in terms of the labeled Tablet strength rather than in terms of the labeled total contents.

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Solution A: Dissolve 330.9 g of dibasic sodium phosphate and 38 g of citric acid in water in a 1-L volumetric flask. Add 10 mL of phosphoric acid, and dilute with water to volume.

Medium: Mix 125.0 mL of *Solution A* and 1 L of 10% sodium lauryl sulfate solution, and dilute to 10 L. Adjust, if necessary, to a pH of 6.8; 900 mL.

Apparatus 2: 50 rpm, with sinkers. (See *Dissolution* (711), *Figure 2a*.)

Times: 3, 6, and 12 h

Mobile phase: Acetonitrile and water (7:3)

Standard stock solution: 1.11 mg/mL of USP

Nifedipine RS in methanol

Standard solution: 0.1 mg/mL of USP Nifedipine RS from the *Standard stock solution* in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 350 nm

Column: 4.0-mm \times 125-mm; 3- μ m packing L1

Temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved.

Tolerances: See Table 2.

Table 2

Time (h)	Amount Dissolved (%)
3	10–30
6	40–65
12	NLT 80

The percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

For Tablets labeled to contain 30 mg of nifedipine:

Phase 1

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL

Apparatus 2: 100 rpm

Time: 1 h

Standard solution: 0.034 mg/mL of USP Nifedipine RS in *Medium*. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions(See *Ultraviolet-Visible Spectroscopy* (857).)**Mode:** UV**Analytical wavelength:** 238 nm**Cell:** 0.5 cm

Analysis: [NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for Phase 2.] Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in Phase 1, using filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using the *Medium* as the blank.

For Tablets labeled to contain 30 mg of nifedipine:
Phase 2

Medium: 0.5% Sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL

Apparatus 2: 100 rpm**Times:** 1, 4, 8, and 12 h

Standard solution: 0.034 mg/mL of USP Nifedipine RS in *Medium*. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions(See *Ultraviolet-Visible Spectroscopy* (857).)**Mode:** UV**Analytical wavelength:** 238 nm

Analysis: Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in Phase 2, using filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances: See Table 3.**Table 3**

Time (h)	Amount Dissolved ^a (%)
1	NMT 30
4	30–55
8	NLT 60
12	NLT 80

^aFor each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from Phase 1 to the amount dissolved at each time point in Phase 2.

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

For Tablets labeled to contain 60 mg of nifedipine:
Phase 1

Medium: 0.05 M phosphate buffer, pH 7.5; 900 mL

Apparatus 2: 100 rpm**Time:** 25 min

Standard solution: 0.067 mg/mL of USP Nifedipine RS in *Medium*. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions(See *Ultraviolet-Visible Spectroscopy* (857).)**Mode:** UV**Analytical wavelength:** 238 nm

Analysis: [NOTE—After the run, take the Tablet out of the dissolution vessel, adapt a sinker to it, and transfer the Tablet with the sinker to the dissolution vessel containing the *Medium* for Phase 2.] Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in Phase 1, using filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using the *Medium* as the blank.

For Tablets labeled to contain 60 mg of nifedipine:
Phase 2

Medium: 0.5% Sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL

Apparatus 2: 100 rpm**Times:** 1, 4, 8, and 12 h

Standard solution: 0.067 mg/mL of USP Nifedipine RS in *Medium*. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions(See *Ultraviolet-Visible Spectroscopy* (857).)**Mode:** UV**Analytical wavelength:** 238 nm

Analysis: Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) released in Phase 2, using filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using the *Medium* as the blank.

Tolerances: See Table 4.**Table 4**

Time (h)	Amount Dissolved ^a (%)
1	NMT 30
4	40–70
8	NLT 70
12	NLT 80

^aFor each dosage unit, add the amount dissolved in phosphate buffer, pH 7.5 from Phase 1 to the amount dissolved at each time point in Phase 2.

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released in vivo and dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 4.

Medium: 0.5% Sodium lauryl sulfate in simulated gastric fluid without enzyme, pH 1.2; 900 mL

Apparatus 2: 100 rpm**Times:** 1, 4, and 12 h

Standard solution: 0.067 mg/mL of USP Nifedipine RS for Tablets labeled to contain 60 mg, and 0.034 mg/mL of USP Nifedipine RS for Tablets labeled to contain 30 mg, in *Medium*. [NOTE—If necessary, a volume of methanol, not exceeding 10% of the final volume, can be used to help solubilize nifedipine.]

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions(See *Ultraviolet-Visible Spectroscopy* (857).)**Mode:** UV**Analytical wavelength:** UV 238 nm**Cell:** 1 cm

Analysis: Determine the amount of nifedipine ($C_{17}H_{18}N_2O_6$) released, using filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using the *Medium* as the blank.

Tolerances: See Table 5 and Table 6.**Table 5**

For Tablets Labeled to Contain 30 mg of Nifedipine	
Time (h)	Amount Dissolved (%)

For Tablets Labeled to Contain 60 mg of Nifedipine	
Time (h)	Amount Dissolved (%)
1	10–30
4	40–63
12	NLT 80

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$), released at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 5: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 5*.

Medium: Water; 50 mL

Apparatus 7: (See *Drug Release* (724).) Use a 25-cm plexiglas rod, the perimeter of the Tablets being affixed to the rod with a water-insoluble glue; 30 dips/min. The solution containers are 25-mm test tubes, 150–200 mm in length, and the water bath is maintained at $37 \pm 0.5^\circ$.

Times: 4, 12, and 24 h

Diluent A: Methanol and acetonitrile (1:1)

Diluent B: Diluent A and water (1:1)

Standard stock solution: 50 mg of USP Nifedipine RS in Diluent A and water (50:50)

Standard solutions: 0.01, 0.05, and 0.20 mg/mL solutions, from the *Standard stock solution* in Diluent B, that are used at 4-, 12-, and 24-h sampling

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 238 nm

Cell: 0.5 cm

Analysis: [NOTE—For the 4-h time period, filter the solution under test, and determine the absorbance at 456 nm. Use this absorbance value to correct for excipient interference at the other time points.] Determine the amount of nifedipine released at each interval on portions of the *Sample solution* passed through a suitable filter of 0.45- μ m pore size, suitably diluted, if necessary, with Diluent A and water to obtain a final mixture of water, methanol, and acetonitrile (2:1:1), in comparison with the appropriate *Standard solution*, using Diluent B as the blank.

Tolerances: See Table 7.

Table 7

Time (h)	Amount Dissolved (%)
4	NMT 14
12	39–75
24	NLT 75

The cumulative percentages of the labeled amount of nifedipine, released in vivo and dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 6: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium: Simulated gastric fluid without enzyme containing 0.5% of sodium lauryl sulfate, pH 1.2; 900 mL, deaerated

Apparatus 1: 100 rpm

Times: 1, 4, and 12 h

Standard stock solution: 0.33 mg/mL of USP Nifedipine RS in methanol

Standard solution: Quantitatively dilute the *Standard stock solution* with *Medium* to obtain a solution having a concentration of about 0.033 mg/mL.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 329 nm

Cell: 0.5 cm

Blank: *Medium*

Tolerances: See Table 8.

Table 8

Time (h)	Amount Dissolved (%)
1	NMT 15
4	20%–40
12	NLT 80

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 7: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.

Medium: Simulated gastric fluid without enzyme containing 0.5% sodium lauryl sulfate, pH 1.2; 900 mL

Apparatus 2: 100 rpm, with three-prong sinker

Times: 1, 4, and 12 h

Standard solution: (L/900) mg/mL of USP Nifedipine RS in *Medium*, where L is the label claim, in mg/Tablet, of nifedipine. A small amount of methanol, not exceeding 6%–7% of the final volume of the first dilution, can be used to solubilize nifedipine.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 238 nm

Cell: 1 mm, flow cell

Blank: *Medium*

Tolerances: See Table 9.

Table 9

Time (h)	Amount Dissolved (%)
1	NMT 15
4	25–50
12	NLT 80

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 8: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8*.

Acid stage medium: Simulated gastric fluid without enzyme containing 3% polysorbate 80, pH 1.2; 250 mL

Apparatus 3: 20 dpm, 20-mesh polypropylene screen on the bottom; 1 min drip time. The Tablet is automatically transferred by the apparatus to the next set of vessels for each time point.

Time: 1 h

Buffer stage medium: 0.01 M sodium phosphate buffer, pH 6.8, containing 3% polysorbate 80 (dissolve 8.3 g of monobasic sodium phosphate and 1 g of sodium hydroxide in 6 L of water, adjust with either diluted sodium hydroxide or phosphoric acid to a pH of 6.8 ± 0.05 , and add 180 g of polysorbate 80); 250 mL

Times: 2, 8, 12, and 24 h

Mobile phase: Acetonitrile, methanol, and water (35:35:30)

Standard stock solution: 1 mg/mL of USP Nifedipine RS in *Buffer stage medium*. An amount of methanol,

about 40% of the final volume, can be used to dissolve nifedipine.

Standard solution: (L/1000) mg/mL in *Buffer stage medium*, from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 338 nm

Column: 4.6-mm × 25-cm; packing L1

Temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 1.7

Relative standard deviation: NMT 2.0%

Analysis: Calculate the percentage of the labeled amount of nifedipine dissolved at each time point.

At 1 h:

$$D_1 = (r_U/r_S) \times (C_S/L) \times V \times 100$$

At 2 h:

$$D = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$D_2 = D_1 + D$$

At 8 h:

$$D = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$D_8 = D_2 + D$$

At 12 h:

$$D = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$D_{12} = D_8 + D$$

At 24 h:

$$D = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$D_{24} = D_{12} + D$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 250 mL

Tolerances

Acid stage: NMT 5% of the labeled amount of nifedipine is dissolved in 1 h.

Buffer stage: See Table 10.

Table 10

Time (h)	Amount Dissolved (%)
1	NMT 5
2	0–10
8	25–60
12	45–85
24	NLT 80

The cumulative percentages of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 9: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 9*.

Medium: 0.03 M phosphate/citrate buffer, pH 6.8 with 1% sodium lauryl sulfate. (To a solution of 4.1 g/L of dibasic sodium phosphate and 0.475 g/L of citric acid monohydrate in water, add 10 g/L of sodium lauryl sulfate. Adjust if necessary, with phosphoric acid to a pH of 6.8.); 900 mL

Apparatus 2: 50 rpm, with a suitable sinker

Times: 3, 6, and 12 h

Standard stock solution: 0.33 mg/mL of USP Nifedipine RS in methanol

Standard solution: Prepare the corresponding USP Nifedipine RS solutions in *Medium* as directed in Table 11.

Table 11

Tablet Strength (mg)	Concentration (mg/mL)
30	0.033
60	0.066
90	0.099

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 346 nm

Cell: 1 cm

Blank: *Medium*

Analysis

Samples: *Standard solutions* and *Sample solution*

Calculate the concentration (C_i) of nifedipine ($C_{17}H_{18}N_2O_6$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_U/A_S) \times C_S$$

A_U = absorbance of the *Sample solution* at each time point

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Nifedipine RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of nifedipine ($C_{17}H_{18}N_2O_6$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_1 \times V_3)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_3)]] + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

C_i = concentration of nifedipine in the *Sample solution* at the specified time point (i) (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn at each time point (i) (mL)

Tolerances: See Table 12.

Table 12

Time Point (i)	Time (h)	Amount Dissolved (%)	
		Tablets labeled to contain 30 mg and 60 mg of Nifedipine	Tablets labeled to contain 90 mg of Nifedipine
1	3	15–40	10–35
2	6	43–73	40–65
3	12	NLT 80	NLT 80

The percentages of the labeled amount of Nifedipine ($C_{17}H_{16}N_2O_6$) dissolved at the times specified conform to Dissolution (711), Acceptance Table 2.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

[NOTE—Conduct this test promptly after preparation of the *Standard nifedipine solution* and the *Sample solution*.]

Mobile phase: Acetonitrile, methanol, and water (25:25:50)

Quantitative limit stock solution A: 1 mg/mL of USP Nifedipine Nitrophenylpyridine Analog RS in methanol

Quantitative limit solution A: 6 µg/mL of USP Nifedipine Nitrophenylpyridine Analog RS from *Quantitative limit stock solution A* in *Mobile phase*

Quantitative limit stock solution B: 1 mg/mL of USP Nifedipine Nitrosophenylpyridine Analog RS in methanol

Quantitative limit solution B: 1.5 µg/mL of USP Nifedipine Nitrosophenylpyridine Analog RS from *Quantitative limit stock solution B* in *Mobile phase*

Standard nifedipine stock solution: 1 mg/mL of USP Nifedipine RS in methanol

Standard nifedipine solution: 0.3 mg/mL of USP Nifedipine RS from *Standard nifedipine stock solution* in *Mobile phase*

System suitability solution: *Quantitative limit solution A*, *Quantitative limit solution B*, and *Standard nifedipine solution* (1:1:1)

Standard solution: *Mobile phase*, *Quantitative limit solution A*, and *Quantitative limit solution B* (1:1:1)

[NOTE—Each mL of this solution contains about 2 µg of USP Nifedipine Nitrophenylpyridine Analog RS and 0.5 µg of USP Nifedipine Nitrosophenylpyridine Analog RS.]

Sample solution: Use a portion of the *Sample solution* prepared as directed in the Assay.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Columns

Guard: 2.1-mm × 3-cm; packing L1

Analytical: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 25 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between the nitrophenylpyridine analog and nitrosophenylpyridine analog peaks; NLT 1.0 between the nitrosophenylpyridine analog and nifedipine peaks

Relative standard deviation: NMT 10% for each analog

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each analog in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each analog from the *Sample solution*

r_S = peak response of each analog from the *Standard solution*

C_S = concentration of the appropriate analog USP Reference Standard in the *Standard solution* (µg/mL)

C_U = nominal concentration of nifedipine in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 2.0% of nifedipine nitrophenylpyridine analog and NMT 0.5% of nifedipine nitrosophenylpyridine analog, both relative to the nifedipine content

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

- **LABELING:** The labeling indicates the *Dissolution Test* with which the product complies.

- **USP REFERENCE STANDARDS (11)**

USP Nifedipine RS

USP Nifedipine Nitrophenylpyridine Analog RS

Dimethyl 4-(2-nitrophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

$C_{17}H_{16}N_2O_6$ 344.33

USP Nifedipine Nitrosophenylpyridine Analog RS

Dimethyl 4-(2-nitrosophenyl)-2,6-dimethylpyridine-3,5-dicarboxylate.

$C_{17}H_{16}N_2O_5$ 328.33

Nimodipine

$C_{21}H_{26}N_2O_7$ 418.44

3,5-Pyridinedicarboxylic acid, 1,4-dihydro-2,6-dimethyl-4-(3-nitrophenyl)-, 2-methoxyethyl 1-methylethyl ester; Isopropyl 2-methoxyethyl 1,4-dihydro-2,6-dimethyl-4-(*m*-nitrophenyl)-3,5-pyridinedicarboxylate [66085-59-4].

DEFINITION

Nimodipine contains NLT 98.0% and NMT 102.0% of nimodipine ($C_{21}H_{26}N_2O_7$), calculated on the dried basis.

[NOTE—Throughout the following procedures, protect samples, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

- **B.** The retention time of the *Sample solution* corresponds to that of *Standard solution A*, as obtained in the test for *Organic Impurities*.

ASSAY

- **PROCEDURE**

Mobile phase: Methanol, tetrahydrofuran, and water (200:200:600)

Standard solution: 0.3 mg/mL of USP Nimodipine RS in *Mobile phase* prepared as follows. Transfer a quantity

of USP Nimodipine RS to a suitable volumetric flask, dissolve in a volume of tetrahydrofuran equivalent to 10% of the total volume, and dilute with *Mobile phase* to volume.

Sample solution: 0.3 mg/mL of Nimodipine in *Mobile phase* prepared as follows. Transfer a quantity of Nimodipine to a suitable volumetric flask, dissolve in a volume of tetrahydrofuran equivalent to 10% of the total volume, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 12.5-cm; 5-μm packing L1

Temperature: 40°

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nimodipine ($C_{21}H_{26}N_2O_7$) in the portion of Nimodipine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nimodipine from the *Sample solution*

r_S = peak response of nimodipine from the *Standard solution*

C_S = concentration of USP Nimodipine RS in the *Standard solution* (mg/mL)

C_U = concentration of Nimodipine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• ORGANIC IMPURITIES

Mobile phase and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution A: 1.6 mg/mL of USP Nimodipine RS in *Mobile phase* prepared as follows. Transfer a quantity of USP Nimodipine RS to a suitable volumetric flask, dissolve in a volume of tetrahydrofuran equivalent to 10% of the total volume, and dilute with *Mobile phase* to volume.

Standard stock solution B: 0.8 mg/mL each of USP Nimodipine RS and USP Nimodipine Related Compound A RS in *Mobile phase* prepared as follows. Transfer quantities of USP Nimodipine RS and USP Nimodipine Related Compound A RS to a suitable volumetric flask, dissolve in a volume of tetrahydrofuran equivalent to 10% of the total volume, and dilute with *Mobile phase* to volume.

Standard solution A: 3.2 μg/mL of USP Nimodipine RS from *Standard stock solution A* in *Mobile phase*

Standard solution B: 1.6 μg/mL each of USP Nimodipine RS and USP Nimodipine Related Compound A RS from *Standard stock solution B* in *Mobile phase*

Sample solution: 1.6 mg/mL of Nimodipine prepared as follows. Dissolve 40 mg of Nimodipine in 2.5 mL of tetrahydrofuran, and dilute with *Mobile phase* to 25 mL.

System suitability

Sample: *Standard solution B*

[NOTE—The relative retention times for nimodipine related compound A and nimodipine are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between nimodipine related compound A and nimodipine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of nimodipine related compound A in the portion of Nimodipine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nimodipine related compound A from the *Sample solution*

r_S = peak response of nimodipine related compound A from *Standard solution B*

C_S = concentration of USP Nimodipine Related Compound A RS in *Standard solution B* (μg/mL)

C_U = concentration of Nimodipine in the *Sample solution* (μg/mL)

Acceptance criteria: NMT 0.1% of nimodipine related compound A

Calculate the percentage of any other impurity in the portion of Nimodipine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of nimodipine from *Standard solution A*

C_S = concentration of USP Nimodipine RS in *Standard solution A* (μg/mL)

C_U = concentration of Nimodipine in the *Sample solution* (μg/mL)

Acceptance criteria

Individual impurities: NMT 0.2% of any other impurity

Total impurities: NMT 0.5%

SPECIFIC TESTS

• **OPTICAL ROTATION**, *Specific Rotation* (781S)

Sample solution: 50 mg/mL in acetone

Acceptance criteria: −10° to +10°

• **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Nimodipine RS

USP Nimodipine Related Compound A RS

2-Methoxyethyl-1-methylethyl-2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate.

$C_{21}H_{24}N_2O_7$ 416.42

Nitrofurantoin

$C_8H_6N_4O_5$ (anhydrous) 238.16

$C_8H_6N_4O_5 \cdot H_2O$ 256.18

2,4-Imidazolidinedione, 1-[[[(5-nitro-2-furyl)methylene]-amino]-;

1-[(5-nitrofurfurylidene)amino]hydantoin [67-20-9].

Monohydrate [17140-81-7].

DEFINITION

Nitrofurantoin is anhydrous or contains one molecule of water of hydration. It contains NLT 98.0% and NMT 102.0% of $C_8H_6N_4O_5$, calculated on the anhydrous basis. [NOTE—Nitrofurantoin and solutions of it are discolored by alkali and by exposure to light and are decomposed upon contact with metals other than stainless steel and aluminum.]

IDENTIFICATION• **A. INFRARED ABSORPTION (197M)**

Sample: Previously dried at 140° for 30 min

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer: Dissolve 6.8 g of monobasic potassium phosphate in 500 mL of water. Add about 30 mL of 1.0 N sodium hydroxide sufficient to adjust to a pH of 7.0, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (12:88)

Internal standard solution: 1 mg/mL of acetanilide in water

Standard solution: 0.56 mg/mL of USP Nitrofurantoin RS prepared as follows. Dissolve 50 mg of USP Nitrofurantoin RS in 40.0 mL of dimethylformamide, and add 50.0 mL of *Internal standard solution*.

Sample solution: 0.56 mg/mL of Nitrofurantoin prepared as directed for *Standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—Adjust the operating parameters so that the retention time of the nitrofurantoin peak is about 8 min and the peak heights are about half full-scale.]

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L1

Injection size: 5–10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between the acetanilide and nitrofurantoin peaks

Relative standard deviation: NMT 2.0% determined from the ratio of the peak responses

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nitrofurantoin ($C_8H_6N_4O_5$) in the portion of Nitrofurantoin taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (peak response of nitrofurantoin/peak response of acetanilide) from the *Sample solution*

R_S = internal standard ratio (peak response of nitrofurantoin/peak response of acetanilide) from the *Standard solution*

C_S = concentration of USP Nitrofurantoin RS in the *Standard solution* (mg/mL)

C_U = concentration of Nitrofurantoin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES• **LIMIT OF NITROFURFURAL DIACETATE**

Standard solution: 100 µg/mL of USP Nitrofurfural Diacetate RS in dimethylformamide and acetone (1:10)

Sample solution: Dissolve 100 mg of Nitrofurantoin in 1 mL of dimethylformamide, and dilute with acetone to 10.0 mL.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Chloroform and methanol (9:1)

Spray reagent: Dissolve 0.75 g of phenylhydrazine hydrochloride in 50 mL of water, and decolorize with activated charcoal. Add 25 mL of hydrochloric acid, and mix with water to produce 200 mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Develop in the *Developing solvent system* until the solvent front has moved three-fourths the length of the plate, allow to air-dry for 5 min, and heat the plate at 105° for 5 min. While it is still warm, locate the spots by spraying the plate with *Spray reagent*.

Acceptance criteria: Any spot produced by the *Sample solution*, at an R_f value of 0.7, is not greater in size or intensity than that produced by the *Standard solution* at the same R_f value: NMT 1.0% of nitrofurfural diacetate is found.

• **LIMIT OF NITROFURAZONE**

Buffer: Prepare as directed in the *Assay*.

Mobile phase: Tetrahydrofuran and *Buffer* (10:90)

System suitability stock solution: 5.0 µg/mL each of USP Nitrofurazone RS and USP Nitrofurantoin RS in dimethylformamide

System suitability solution: 0.5 µg/mL each of USP Nitrofurazone RS and USP Nitrofurantoin RS in *Mobile phase* from *System suitability stock solution*

Standard stock solution: 5.0 µg/mL of USP Nitrofurazone RS in dimethylformamide

Standard solution: 0.5 µg/mL of USP Nitrofurazone RS in water from *Standard stock solution*

Sample solution: Dissolve 100 mg of Nitrofurantoin in 2.0 mL of dimethylformamide, and add 20.0 mL of water. Mix, and allow to stand for 15 min to allow a precipitate to form. Pass a portion of the solution through a suitable nylon filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—Adjust the operating parameters so that the retention time of the nitrofurazone peak is about 10.5 min and its height is about 0.1 half full-scale.]

Mode: LC

Detector: UV 375 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.6 mL/min

Injection size: 60–100 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 4.0 between the nitrofurazone and nitrofurantoin peaks, *System suitability solution*

Relative standard deviation: NMT 2.0% determined from the peak height, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The height of any peak appearing in the *Sample solution* at a retention time corresponding to that of the main peak from the *Standard solution* is NMT the height of the main peak from the *Standard solution* (NMT 0.01%).

SPECIFIC TESTS• **WATER DETERMINATION**, Method III (921)

Analysis: Dry a sample at 140° for 30 min.

Acceptance criteria: For the anhydrous form, it loses NMT 1.0% of its weight; for the hydrous form, it loses 6.5%–7.5% of its weight.

• **SPECIFIC SURFACE AREA** (846) (where it is labeled as being in the form of macrocrystals)

Sample: Outgas a portion of the powder to be placed under test at 150° for 10 min at ambient pressure with nitrogen.

Acceptance criteria: 0.045–0.20 m²/g

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.• **LABELING:** Label it to indicate whether it is anhydrous or hydrous. Nitrofurantoin in the form of macrocrystals is so labeled. The labeling states the specific surface area and which method, specified under *Specific Surface Area* (846), is used.• **USP REFERENCE STANDARDS** (11)

USP Nitrofurantoin RS

USP Nitrofurazone RS

USP Nitrofurfural Diacetate RS

C₉H₉NO₇ 243.17

Nitrofurantoin Capsules**DEFINITION**

Nitrofurantoin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of nitrofurantoin (C₈H₆N₄O₅).

IDENTIFICATION• **A. INFRARED ABSORPTION**

Sample: Add 10 mL of 6 N acetic acid to a quantity of the contents of Capsules equivalent to 100 mg of nitrofurantoin. Boil the solution for a few min, and filter while hot. Cool to room temperature, collect the precipitate of nitrofurantoin, and dry at 105° for 1 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the precipitate so obtained exhibits maxima only at the same wavelength as that of a similar solution of USP Nitrofurantoin RS.

• **B.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.**ASSAY**• **PROCEDURE**

Solution A: Dissolve 6.8 g of monobasic potassium phosphate in 500 mL of water. Add a volume of 1.0 N sodium hydroxide (about 30 mL) sufficient to adjust to a pH of 7.0, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Solution A* (3:22)

Internal standard solution: 1 mg/mL of acetanilide in water

Standard solution: Dissolve 50 mg of USP Nitrofurantoin RS in 40.0 mL of dimethylformamide, and add 50.0 mL of *Internal standard solution*.

Sample solution: Transfer, as completely as possible, the contents of 20 Capsules to a 500-mL flask. Place the emptied Capsules in a beaker, add 25 mL of dimethylformamide, and agitate for 1 min. Decant into the flask containing the Capsule contents. Rinse the emptied Capsules with another two 25-mL portions of dimethylformamide, and decant into the flask. Add sufficient dimethylformamide to bring the volume to about 250 mL. Insert the stopper in the flask, and shake by mechanical means for 15 min. Dilute with dimethylformamide to volume, and mix. If necessary, the sample may be homogenized using a disperser. Pass

through a medium-porosity, sintered-glass filter into a suitable flask. Transfer an aliquot, equivalent to 50 mg of nitrofurantoin, to a flask. Add an accurately measured volume of dimethylformamide to bring the volume in the flask to 40.0 mL. To the flask add 50.0 mL of *Internal standard solution*, mix, and cool to room temperature. Pass a portion of the solution through a nylon filter of 0.45-μm pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L1

Injection volume: 5–10 μL

System suitability

Sample: *Standard solution*

[NOTE—Adjust the operating parameters so that the retention time of the nitrofurantoin peak is about 8 min, and the peak heights are about half full-scale.]

Suitability requirements

Resolution: NLT 3.0 between acetanilide and nitrofurantoin

Relative standard deviation: NMT 2.0%, determined from peak response ratios of replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nitrofurantoin (C₈H₆N₄O₅) in the portion of the powder included in the sample aliquot:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio from the *Sample solution*

R_S = peak response ratio from the *Standard solution*

C_S = concentration of USP Nitrofurantoin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Test 1 (where it is labeled as containing nitrofurantoin macrocrystals)

Medium: pH 7.2 (± 0.05) phosphate buffer; 900 mL

Apparatus 1: 100 rpm

Times: 1, 3, and 8 h

Standard solution: USP Nitrofurantoin RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

Blank: *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: 375 nm

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved
1	20%–60%
3	NLT 45%
8	NLT 60%

The percentage of the labeled amount of nitrofurantoin (C₈H₆N₄O₅) dissolved at the 1-h point conforms to *Acceptance Table 2* in *Dissolution* (711), and the percentages dissolved at the 3- and 8-h points conform to the criteria for the final test time in *Acceptance Table 2* in (711).

Test 2 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms): If the

product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Acid medium: 0.01 N hydrochloric acid for 1 h; 900 mL

pH 7.5 buffer medium: Prepare a pH 7.5 buffer concentrate by dissolving 62.2 g of potassium hydroxide and 129.3 g of monobasic potassium phosphate in water, dilute with water to 1 L, and mix. After 1 h, change the *Acid medium* to *pH 7.5 buffer medium* by adding 50 mL of pH 7.5 buffer concentrate, and run for an additional 6 h.

Apparatus 2: 100 rpm, with sinkers made of Teflon-coated steel wire prepared by forming a coil approximately 22 mm long from a 13-cm length of 20-gauge wire (see Figure 1)

Figure 1. Sinkers.

Times: 1, 3, and 7 h

Acid-stage standard solution: 0.025 mg/mL of USP Nitrofurantoin RS in *Acid medium*

Buffer-stage standard solution: 0.075 mg/mL of USP Nitrofurantoin RS in *pH 7.5 buffer medium*

Instrumental conditions

Mode: UV

Analytical wavelength: 375 nm

Analysis: Calculate the percentages of the labeled amount (Q) of nitrofurantoin ($C_8H_6N_4O_5$) dissolved from UV absorbances at the isosbestic wavelength at about 375 nm on filtered portions of each solution under test, suitably diluted, if necessary, with *Acid medium* or *pH 7.5 buffer medium* when appropriate, in comparison with the appropriate *Standard solution*.

Tolerances: See Table 2.

Table 2

Time (h)	Amount Dissolved (Individual)	Amount Dissolved (Mean)
1	2%–16%	5%–13%
3	27%–69%	39%–56%
7	NLT 68%	NLT 81%

The percentages of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) dissolved at the specified times conform to Table 3.

Table 3

Level	Number Tested	Criteria
L ₁	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is NLT the stated amount at the final test time. All individual values lie within the ranges for the individuals at each interval and are NLT the stated amount at the final test time.
L ₂	12	The mean percentage of dissolved label claim lies within the range for the means at each interval and is NLT the stated amount at the final test time. NMT 2 of the 24 individual values lie outside the stated ranges for individuals at each interval, and NMT 2 of 24 are less than the stated amount at the final test time.

Test 3 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Acid medium, pH 7.5 buffer medium, Apparatus 2, Times, Acid-stage standard solution, Buffer-stage standard solution, and Analysis: Proceed as directed in Test 2.

Tolerances: See Table 4.

Table 4

Time (h)	Amount Dissolved (Individual)	Amount Dissolved (Mean)
1	2%–16%	5%–13%
3	50%–80%	55%–75%
7	NLT 85%	NLT 90%

The percentages of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) dissolved at the specified times conform to Acceptance Table 2 in (711).

Test 4 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms): If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Acid medium: 0.01 N hydrochloric acid for 1 h; 900 mL, deaerated

pH 7.5 buffer medium: Prepare a pH 7.5 buffer concentrate by dissolving 62.2 g of potassium hydroxide and 129.3 g of monobasic potassium phosphate in water, dilute with water to 1 L, and mix. After 1 h change the *Acid medium* to *pH 7.5 buffer medium* by adding 50 mL of pH 7.5 buffer concentrate, and run for an additional 9 h.

Apparatus 2: 100 rpm, with helix sinkers

Times: 1, 3, and 10 h

Standard stock solution: Transfer 25 mg of USP Nitrofurantoin RS to a 10-mL volumetric flask. Add 7.5 mL of dimethylformamide, and sonicate until dissolved. Allow to cool to room temperature, and dilute with dimethylformamide to volume.

Acid-stage standard solution: Dilute 2.0 mL of the *Standard stock solution* with *Acid medium* to 200 mL.

Buffer-stage standard solution: Transfer 3.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with *pH 7.5 buffer medium* to volume.

Stock capsule shell blank: Place 10 empty, clean Capsules into a 900-mL volumetric flask, and add 800 mL of *Acid medium*. Gently heat to $37 \pm 0.5^\circ$, and stir until all the Capsules are dissolved. Allow to cool to room temperature, and dilute with *Acid medium* to volume.

Buffer-stage capsule shell blank: Transfer 100.0 mL of the *Stock capsule shell blank* to a 1000-mL volumetric flask. Add 56 mL of pH 7.5 buffer medium, dilute with *Acid medium* to volume, and mix. Filter, using the same filter as for the *Sample solution*.

Sample solution: Pass portions of the solution under test through a 1.2- μ m glass/0.45- μ m polyethersulfone combination filter, discarding the first few mL.

Instrumental conditions

Mode: UV

Analytical wavelength: 375 nm

Analysis: Calculate the percentages of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) dissolved from portions of the *Sample solution* in comparison with the appropriate *Acid-stage standard solution* or *Buffer-stage standard solution*. Correct for the appropriate capsule shell blank absorbance, using a 0.1-cm cell, and the appropriate medium as the blank.

Tolerances: See Table 5.

Table 5

Time (h)	Amount Dissolved
1	NMT 25%
3	25%–50%
10	NLT 80%

The percentages of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) dissolved at the specified times conform to Acceptance Table 2 in (711).

Test 5 (where it is labeled as containing both nitrofurantoin macrocrystalline and monohydrate forms): If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 5.

Acid medium: 0.01 N hydrochloric acid for 1 h; 900 mL, deaerated

Buffer concentrate: 60 g/L of potassium hydroxide and 129.3 g/L of monobasic potassium phosphate in water

pH 7.5 buffer medium: Prepare by adding 60 mL of *Buffer concentrate* to 890 mL of *Acid medium*.

Apparatus 2: 100 rpm, with Teflon-coated sinkers and paddles

Times: 1, 3, and 7 h

Standard stock solution: 2.48 mg/mL of USP Nitrofurantoin RS in acetonitrile. Sonicate using 50% of the final volume of acetonitrile to dissolve. Use an amber volumetric flask.

Acid-stage standard solution: 24.8 μ g/mL of USP Nitrofurantoin RS in *Acid medium* from *Standard stock solution*. Use an amber volumetric flask.

Buffer-stage standard solution: 74.4 μ g/mL of USP Nitrofurantoin RS in pH 7.5 buffer medium from *Standard stock solution*. Use an amber volumetric flask.

Acid-stage sample solution: After 1 h, collect 10 mL of the solution under test, and pass through a 0.45- μ m PVDF filter, discarding the first 5 mL of the filtrate.

Buffer-stage sample solution: After removing 10 mL of *Acid medium*, add 60 mL of pH 7.5 buffer medium. The pH of the resulting medium should be about 7.5. Continue the dissolution for another 2 h and 6 h. Collect 10 mL at each time point, and pass through a 0.45- μ m PVDF filter, discarding the first 5 mL of the filtrate.

Acid-stage blank: Use *Acid medium*.

Buffer-stage blank: Use pH 7.5 buffer medium.

Instrumental conditions

Mode: UV

Analytical wavelength: 375 nm

Cell: 0.5 cm for acid-stage and 0.1 cm for buffer-stage

Analysis

Samples: *Acid-stage standard solution*, *Buffer-stage standard solution*, *Acid-stage sample solution*, *Buffer-stage sample solution*, *Acid-stage blank*, and *Buffer-stage blank*

Calculate the concentration (C_i) of nitrofurantoin ($C_8H_6N_4O_5$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_u/A_s) \times C_s$$

A_u = absorbance of the *Sample solution*

A_s = absorbance of the *Standard solution*

C_s = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V_i \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V_2) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V_3) + [(C_2 + C_1) \times V_5]\} \times (1/L) \times 100$$

C_i = concentration of nitrofurantoin in the portion of sample withdrawn at the specified time point (mg/mL)

V_i = volume of medium, 900 mL

L = label claim (mg/Capsule)

V_2 = volume of medium, 950 mL

V_3 = volume of the *Sample solution* withdrawn at each time point, 10 mL

V_5 = volume of medium, 940 mL

Tolerances: See Table 6.

Table 6

Time Point (i)	Time (h)	Amount Dissolved (Individual)	Amount Dissolved (Mean)
1	1	NMT 12%	NMT 12%
2	3	NLT 80%	80%–100%
3	7	NLT 85%	NLT 90%

The percentages of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) dissolved at the specified times conform to Table 7.

Table 7

Level	Number Tested	Criteria
		The mean percentage of dissolved label claim lies within the range for the means at each interval and is NLT the stated amount at the final test time. All individual values lie within the ranges for the individuals at each interval and are NLT the stated amount at the final test time.
L_1	12	

Table 7 (Continued)

Level	Number Tested	Criteria
L ₂	12	If the requirements of level L ₁ are not met, test another twelve (12) Capsules. The requirements are met if the mean percentage of dissolved label claim of all 24 Capsules tested lies within the range for the means at each interval and is NLT the stated amount at the final test time. NMT 2 of the 24 individual values of Capsules lie outside the stated range for individuals at each interval, and NMT 2 of 24 Capsules are less than the stated amount at the final test time.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Solution A, Mobile phase, Internal standard solution, Standard solution, Chromatographic system, and Analysis: Proceed as directed in the Assay.

Sample solution: Transfer the contents of 1 Capsule to a suitable flask, and add a volume of dimethylformamide to obtain a solution having a concentration of about 1.2 mg/mL of nitrofurantoin. Shake the flask for 15 min. If necessary, the sample may be homogenized, using a disperser. In the case of a 50- or 100-mg Capsule, transfer 40.0 mL of this solution to a suitable flask, add 50.0 mL of *Internal standard solution*, mix, and cool to room temperature. Pass a portion of the solution through a nylon filter of 0.45- μ m pore size, discarding the first few mL of the filtrate. In the case of a 25-mg Capsule, transfer 20.0 mL of the solution to a suitable flask, and add 25.0 mL of *Internal standard solution* instead of 50.0 mL.

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES: LIMIT OF NITROFUZAZONE

Solution A: Prepare as directed in the Assay.

Mobile phase: Tetrahydrofuran and *Solution A* (1:9)

System suitability stock solution: 5.0 μ g/mL each of nitrofurazone and nitrofurantoin in dimethylformamide

System suitability solution: *System suitability stock solution* and *Mobile phase* (1:10)

Standard stock solution: 5.0 μ g/mL of USP Nitrofurazone RS in dimethylformamide

Standard solution: Transfer 2.0 mL of the *Standard stock solution* into a glass-stoppered flask, add 20.0 mL of water, and mix.

Sample solution: Transfer a portion of Capsule contents equivalent to 100 mg of nitrofurantoin into a 25-mL glass-stoppered flask. Add 2.0 mL of dimethylformamide, and shake for 5 min. Add 20.0 mL of water, mix, and allow to stand for 15 min. Pass a portion of the mixture through a nylon filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 375 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1.6 mL/min

Injection volume: 60–100 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—Adjust the operating parameters so that the nitrofurazone peak in the chromatogram of the *Standard solution* has a retention time of about 10.5 min and a height of about 0.1 full-scale.]

Suitability requirements

Resolution: NLT 4.0 between the nitrofurazone and nitrofurantoin peaks, *System suitability solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The height of any peak from the *Sample solution* at a retention time corresponding to that of the main peak from the *Standard solution* is NMT the height of the main peak from the *Standard solution*. NMT 0.01% of nitrofurazone is found.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Capsules that contain the macrocrystalline form of nitrofurantoin are so labeled. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
 - USP Nitrofurantoin RS
 - USP Nitrofurazone RS

Nitrofurantoin Oral Suspension

DEFINITION

Nitrofurantoin Oral Suspension is a suspension of Nitrofurantoin in a suitable aqueous vehicle. It contains, in each 100 mL, NLT 460 mg and NMT 540 mg of nitrofurantoin ($C_8H_6N_4O_5$).

IDENTIFICATION

• A. INFRARED ABSORPTION

Sample solution: 10 mL of Oral Suspension in 15 mL of acetone

Analysis: Warm the *Sample solution* to 50°, with stirring, to coagulate the excipients. Filter, evaporate the acetone with the aid of a warm air blast nearly to dryness, add 10 mL of acetic acid, heat to boiling, and filter while hot. Cool the filtrate to room temperature. Filter the precipitated nitrofurantoin, and dry at 105° for 1 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the precipitate obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Nitrofurantoin RS.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: Dissolve 6.8 g of monobasic potassium phosphate in 500 mL of water. Add about 30 mL of 1.0 N sodium hydroxide sufficient to adjust to a pH of 7.0, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (12:88)

Internal standard solution: 0.065 mg/mL of acetanilide in *Mobile phase*

Standard stock solution: 0.25 mg/mL of USP Nitrofurantoin RS prepared as follows. Transfer the required amount in suitable volumetric flask, and dissolve in 50% of the final volume of dimethylformamide and 20% of the final volume of water. Cool to room temperature, and dilute with dimethylformamide to volume.

Standard solution: Transfer 4.0 mL of *Standard stock solution* to a glass-stoppered flask, and add 15.0 mL of *Internal standard solution*.

Sample stock solution: Nominally 0.25 mg/mL of nitrofurantoin prepared as follows. Transfer a volume of

Oral Suspension to a suitable volumetric flask, add 20% of the final volume of water, and mix. Add 50% of the final volume of dimethylformamide, and shake the flask for 20 min. Cool to room temperature, and dilute with dimethylformamide to volume. Centrifuge a portion of the solution, and use the supernatant to prepare the *Sample solution*.

Sample solution: Transfer 4.0 mL of *Sample stock solution* to a glass-stoppered flask, add 15.0 mL of *Internal standard solution*, and mix. Pass a portion of the solution through a 5- μ m pore size polytetrafluoroethylene filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—Adjust the operating parameters so that the retention time of the nitrofurantoin peak is about 8 min and its peak height is about half-full scale.]

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1.2 mL/min

Injection size: 15 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 3.5 between the acetanilide and nitrofurantoin peaks

Relative standard deviation: NMT 2.0% determined from the ratio of the peak responses

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity per volume, in mg/100 mL, of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$) in the Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times C_S \times D$$

R_U = internal standard ratio (peak response of nitrofurantoin/peak response of acetanilide) from the *Sample solution*

R_S = internal standard ratio (peak response of nitrofurantoin/peak response of acetanilide) from the *Standard solution*

C_S = concentration of USP Nitrofurantoin RS in the *Standard solution* (mg/mL)

D = dilution factor, *Sample stock solution* to *Sample solution*, 9500

Acceptance criteria: 460–540 mg/100 mL of $C_8H_6N_4O_5$

PERFORMANCE TESTS

• UNIFORMITY OF DOSAGE UNITS (905)

For Oral Suspension packaged in single-unit containers: Meets the requirements

• DELIVERABLE VOLUME (698):

For Oral Suspension packaged in multiple-unit containers: Meets the requirements

IMPURITIES

• LIMIT OF *N*-(AMINOCARBONYL)-*N*-[[[5-NITRO-2-FURANYL]METHYLENE]-AMINO]GLYCINE (NF 250)

Buffer and Mobile phase: Prepare as directed in the *Assay*.

Standard solution: 2.5 μ g/mL of USP Nitrofurantoin Related Compound A RS in *Mobile phase*

Sample solution: Nominally 0.05 mg/mL of nitrofurantoin in *Mobile phase* from Oral Suspension. Centrifuge a portion of this solution. Pass a portion of the supernatant through a polytetrafluoroethylene filter having a 5- μ m pore size, discarding the first few mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—Adjust the operating parameters so that the NF 250 peak has a retention time of between 3 and 6 min and its height is about 0.1 full scale.]

Mode: LC

Detector: UV 375 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1.2 mL/min

Injection size: 30–60 μ L

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The height of any peak appearing in the *Sample solution* at a retention time corresponding to that of the main peak from the *Standard solution* is NMT the height of the main peak from the *Standard solution* (NMT 5.0%).

SPECIFIC TESTS

• **PH (791):** 4.5–6.5

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Nitrofurantoin RS

USP Nitrofurantoin Related Compound A RS

(*N*-(Aminocarbonyl)-*N*-[[[5-nitro-2-furanyl]-methylene]-amino]glycine).

Nitrofurantoin Tablets

DEFINITION

Nitrofurantoin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of nitrofurantoin ($C_8H_6N_4O_5$).

IDENTIFICATION

• A. INFRARED ABSORPTION

Sample: Add 10 mL of 6 N acetic acid to an amount equivalent to 100 mg of nitrofurantoin from powdered Tablets. Boil for a few min, and filter while hot. Cool to room temperature, collect the precipitate of nitrofurantoin, and dry at 105° for 1 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the precipitate from the *Sample* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Nitrofurantoin RS.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: Dissolve 6.8 g of monobasic potassium phosphate in 500 mL of water. Add about 30 mL of 1.0 N sodium hydroxide sufficient to adjust to a pH of 7.0, and dilute with water to 1 L.

Mobile phase: Acetonitrile and *Buffer* (12:88)

Internal standard solution: 1 mg/mL of acetanilide in water

Standard solution: 0.56 mg/mL of USP Nitrofurantoin RS prepared as follows. Dissolve 50 mg of USP Nitrofurantoin RS in 40.0 mL of dimethylformamide, and add 50.0 mL of *Internal standard solution*.

Sample solution: Nominally 0.56 mg/mL of nitrofurantoin prepared as follows. Mix an amount equivalent to 50 mg of nitrofurantoin from powdered Tablets (NLT 20) with 40.0 mL of dimethylformamide, and shake mechanically for 15 min. Add 50.0 mL of *Internal standard solution*, mix, and cool to room temperature. Pass a portion of the solution through a nylon filter having a pore size of 0.45- μ m, discarding the first few mL of the filtrate.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

[NOTE—Adjust the operating parameters so that the retention time of the nitrofurantoin peak is about 8 min and the peak height is about half full-scale.]

USP Nitrofurantoin RS

USP Nitrofurazone RS

NitrofurazoneC₆H₆N₄O₄ 198.14

Hydrazinecarboxamide, 2-[(5-nitro-2-furanyl)methylene]-5-Nitro-2-furaldehyde semicarbazone [59-87-0].

» Nitrofurazone, dried at 105° for 1 hour, contains not less than 98.0 percent and not more than 102.0 percent of C₆H₆N₄O₄.

NOTE—Avoid exposing solutions of nitrofurazone at all times to direct sunlight, excessive heat, strong fluorescent lighting, and alkaline materials.

Packaging and storage—Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

USP Reference standards (11)—

USP Nitrofurazone RS

USP Nitrofurazone Related Compound A RS

5-Nitro-2-furfuraldiazine.

$C_{10}H_6N_4O_6$ 278.18

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 8 µg per mL, prepared as directed in the Assay.

Ratio: A_{306} / A_{375} does not exceed 0.25.

C: Dissolve 400 mg of potassium hydroxide in 10 mL of alcohol. Immediately before use dilute this solution with dimethylformamide to 100 mL. To 10 mL of the prepared solution add a few crystals of Nitrofurazone: a purple solution results.

pH (791)—Suspend 1 g in 100 mL of water, shake for 15 minutes, allow the suspension to settle, and filter: the pH of the filtrate is between 5.0 and 7.5.

Loss on drying (731)—Dry it at 105° for 1 hour: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Ordinary impurities (466)—

Test solution: dimethylformamide.

Standard solution: dimethylformamide.

Application volume: 10 µL.

Eluant: a mixture of chloroform, methanol, and ammonium hydroxide (60:24:3), in a nonequilibrated chamber.

Visualization: 1.

Limit of 5-nitro-2-furfuraldiazine—

Adsorbent: 0.5-mm layer of chromatographic silica gel.

Test solution—Transfer 2.0 g to a 100-mL volumetric flask. Dissolve in 60 mL of dimethylformamide, dilute with acetone to volume, and mix.

Standard solution—Transfer 50.0 mg of USP Nitrofurazone Related Compound A RS to a 100-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix. [NOTE—USP Nitrofurazone Related Compound A RS is 5-nitro-2-furfuraldiazine.] Transfer 5.0 mL of this solution to a 25-mL volumetric flask, add 10 mL of dimethylformamide, dilute with acetone to volume, and mix.

Application volume: 5 µL.

Developing solvent system: a mixture of ethyl acetate and cyclohexane (4:1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). With a suitable densitometer, equipped with a filter having its maximum transmittance at about 254 nm, locate and scan the spot produced by the *Standard solution* and any spot from the *Test solution* having the same R_f as that produced by the *Standard solution*: the area and intensity of any spot from the *Test solution* are not greater than the area and intensity produced by the spot from the *Standard solution* (0.5%).

Assay—Transfer about 100 mg of Nitrofurazone, previously dried and accurately weighed, to a 250-mL volumetric flask, dissolve in 50 mL of dimethylformamide, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Nitrofurazone RS in the same medium having a known concentration of about 8 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 375 nm, with a suitable spectrophotome-

ter, using water as the blank. Calculate the quantity, in mg, of $C_{10}H_6N_4O_6$ in the Nitrofurazone taken by the formula:

$$12.5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Nitrofurazone RS in the Standard solution, and A_U and A_S are the absorbances of the solution of Nitrofurazone and the Standard solution, respectively.

Nitrofurazone Ointment

» Nitrofurazone Ointment is Nitrofurazone in a suitable water-miscible base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nitrofurazone ($C_{10}H_6N_4O_6$).

NOTE—Avoid exposure at all times to direct sunlight, excessive heat, strong fluorescent lighting, and alkaline materials.

Packaging and storage—Preserve in tight, light-resistant containers. Avoid exposure to direct sunlight, strong fluorescent lighting, and excessive heat.

USP Reference standards (11)—

USP Nitrofurazone RS

Completeness of solution—One g dissolves in 9 mL of water to form a clear solution.

Identification—Dissolve 400 mg of potassium hydroxide in a mixture of 9.5 mL of alcohol and 0.5 mL of methanol. Immediately before use, dilute with dimethylformamide to 100 mL. To 10 mL of this solution add a quantity of Ointment, equivalent to about 10 µg of nitrofurazone, and mix: a purple solution results.

Assay—[NOTE—Protect from light all solutions that contain nitrofurazone.]

Triethylamine buffer—Transfer 100 mL of triethylamine to a 1000-mL volumetric flask. Add about 800 mL of water, and cautiously add 80 mL of phosphoric acid. Mix, allow to cool to ambient temperature, dilute with water to volume, mix, and pass through a nylon filter having a 0.5-µm or finer porosity.

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, and *Triethylamine buffer* (790:200:10). Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 50 mg of USP Nitrofurazone RS, accurately weighed, to a 50-mL low-actinic volumetric flask, add 10 mL of dimethylformamide, and swirl to dissolve. Dilute with alcohol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL low-actinic volumetric flask, dilute with alcohol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL low-actinic volumetric flask containing 15 mL of alcohol, dilute with water to volume, and mix. This solution contains about 0.01 mg of USP Nitrofurazone RS per mL.

Assay preparation—Transfer an accurately weighed portion of Ointment, equivalent to about 1 mg of nitrofurazone, to a 100-mL low-actinic volumetric flask. Add 0.2 mL of dimethylformamide and about 25 mL of alcohol, and sonicate for about 35 minutes. Dilute with water to volume, mix, and pass through a nylon filter having a 0.5-µm or finer porosity. Use the filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 365-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as di-

rected for *Procedure*: the column efficiency determined from the nitrofurazone peak is not less than 1500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of nitrofurazone ($C_6H_6N_4O_4$) in the portion of Ointment taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Nitrofurazone RS in the *Standard preparation*; and r_u and r_s are the nitrofurazone peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nitrofurazone Topical Solution

» Nitrofurazone Topical Solution contains not less than 95.0 percent and not more than 105.0 percent (w/w) of the labeled amount of $C_6H_6N_4O_4$. **NOTE**—Avoid exposure at all times to direct sunlight, excessive heat, and alkaline materials.

Packaging and storage—Preserve in tight, light-resistant containers. Avoid exposure to direct sunlight and excessive heat.

USP Reference standards (11)—
USP Nitrofurazone RS

Identification—Dissolve 400 mg of potassium hydroxide in a mixture of 9.5 mL of alcohol and 0.5 mL of methanol. Immediately before use dilute with dimethylformamide to 100 mL. To 10 mL of this solution add 1 drop of Topical Solution: a purple solution results.

Assay—[**NOTE**—Protect from light all solutions that contain nitrofurazone.]

Triethylamine buffer, Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay under Nitrofurazone Ointment*.

Assay preparation—Transfer an accurately measured portion of Topical Solution, equivalent to about 1 mg of nitrofurazone, to a 100-mL low actinic volumetric flask. Add 0.2 mL of dimethylformamide and about 25 mL of warm (between 40° and 50°) alcohol. Dilute with water to volume, and mix.

Procedure—Proceed as directed in the *Assay under Nitrofurazone Ointment*. Calculate the quantity, in mg, of $C_6H_6N_4O_4$ in the portion of Topical Solution taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Nitrofurazone RS in the *Standard preparation*, and r_u and r_s are the nitrofurazone peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ammonia N 13 Injection

» Ammonia N 13 Injection is a sterile solution of $^{13}NH_3$ in Sodium Chloride Injection, suitable for intravenous administration, in which a portion of

the molecules are labeled with radioactive ^{13}N (see *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823)). It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{13}N expressed in MBq (or mCi) per mL at the time indicated in the labeling.

Specific activity: no carrier added.

Packaging and storage—Preserve in single-dose or multiple-dose containers that are adequately shielded.

Labeling—Label it to include the following, in addition to the information specified for *Labeling* (7), *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{13}N as ammonia expressed as total MBq (mCi) per mL, at time of calibration; the expiration time and date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations correction is to be made for radioactive decay and also indicates that the radioactive half-life of ^{13}N is 9.96 minutes. The label also includes the statement "Do not use if cloudy or if it contains particulate matter."

USP Reference standards (11)—

USP Ammonium Chloride RS

USP Endotoxin RS

Identification—

A: Radionuclidic identity—Its half-life, determined using a suitable detector system (see *Radioactivity* (821)) is between 9.5 and 10.5 minutes.

B: Radiochemical identity—The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the *Radiochemical purity* test.

Bacterial Endotoxins Test (85) (see *Sterilization and Sterility Assurance under Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823))—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, in which V is the maximum administered total dose, in mL, at the expiration time.

pH (791): between 4.5 and 7.5.

Radiochemical purity—

Mobile phase—Add 0.25 mL of concentrated nitric acid to 1000 mL of a mixture of water and methanol (7:3), filter, and degas.

Standard solution—Dissolve an accurately weighed quantity of USP Ammonium Chloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

Test solution—Use the Injection.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 4.1-mm \times 25-cm column that contains 10- μ m packing L17. It is equipped with a gamma ray detector and a conductivity detector. The flow rate is about 2.0 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5%.

Procedure—Prepare a mixture of the *Standard solution* and the *Test solution* (1:1), and inject about 20 μ L of the mixture into the chromatograph, record the chromatograms, and measure the peak areas. The areas of both the main radioactive and nonradioactive peaks are equal. [NOTE—The volume of Injection may be adjusted to obtain suitable detection system sensitivity.] The radioactivity of the major peak is not less than 95% of the total radioactivity measured. The retention time of the *Test solution* corresponds to the retention time of the *Standard solution*.

Change to read:**Radionuclidic purity** ^o(see *Radioactivity* (821)).

(CN 1-May-2017)—Using a suitable gamma-ray spectrometer

• (CN 1-May-2017), count an appropriate aliquot of the Injection for a period of time sufficient to obtain a gamma spectrum. The resultant gamma spectrum should be analyzed for the presence of identifiable photopeaks which are not characteristic of ¹³N emissions. Not less than 99.5% of the observed gamma emissions should correspond to the 0.511 MeV, 1.022 MeV, or Compton scatter peaks of ¹³N.

Chemical purity—This article may be synthesized by different methods and processes and, therefore, contains different impurities. The presence of unlabeled ingredients, reagents, and by-products specific to the process must be controlled, and their potential for physiological or pharmacological effects must be considered.

ALUMINUM (to be determined if Devarda's alloy is used to reduce ¹³N nitrate/nitrite)—

Aluminum standard solution—Transfer 35.17 mg of aluminum potassium sulfate dodecahydrate, accurately weighed, to a 1000-mL volumetric flask, and dilute with water to volume to obtain a solution having a known concentration of 2 µg of aluminum per mL.

Procedure—Pipet 10 mL of *Aluminum standard solution* into each of two 50-mL volumetric flasks. To each flask add 3 drops of methyl orange TS and 2 drops of 6 N ammonium hydroxide, then add 0.5 N hydrochloric acid, dropwise, until the solution turns red. To one flask add 25 mL of sodium thioglycolate TS, and to the other flask add 1 mL of edetate disodium TS. To each flask add 5 mL of eriochrome cyanine TS and 5 mL of acetate buffer TS, and add water to volume. Immediately determine the absorbance of the solution containing sodium thioglycolate TS at the wavelength of maximum absorbance at about 535 nm, with a suitable spectrophotometer, using the solution containing the edetate disodium TS as a blank. Repeat the procedure using two 1.0-mL aliquots of Injection. Calculate the quantity, in µg per mL, of aluminum in the Injection taken by the formula:

$$20(T_U / T_S)$$

in which T_U and T_S are the absorbances of the solutions from the Injection and the *Aluminum standard solution*, respectively. The concentration of aluminum ion in the Injection is not greater than 10 µg per mL.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1), except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility Tests* (71), the latter test being started within 24 hours of final manufacture, and except that it is not subject to the recommendation in *Container Content*.

Assay for radioactivity—Using a suitable calibrated system as directed under *Radioactivity* (821), determine the radioactivity, in MBq (or mCi) per mL, of the Injection.

Diluted Nitroglycerin

$C_3H_5N_3O_9$ 227.09
1,2,3-Propanetriol, trinitrate;
Nitroglycerin [55-63-0].

DEFINITION

Diluted Nitroglycerin is a mixture of nitroglycerin ($C_3H_5N_3O_9$) with lactose, dextrose, alcohol, propylene glycol, or other suitable inert excipient to permit safe han-

dling. It contains NLT 90.0% and NMT 110.0% of the labeled amount of $C_3H_5N_3O_9$. It usually contains NMT 10% of nitroglycerin ($C_3H_5N_3O_9$). [**CAUTION**—Taking into consideration the concentration and amount of nitroglycerin ($C_3H_5N_3O_9$) in Diluted Nitroglycerin, exercise appropriate precautions when handling this material. Nitroglycerin is a powerful explosive and can be detonated by percussion or excessive heat. Do not isolate nitroglycerin ($C_3H_5N_3O_9$).]

IDENTIFICATION

- **A.** The R_f value of the principal spot of *Sample solution A* corresponds to that of the *Standard solution*, as obtained in the *Procedure for Organic Impurities*.
- **B.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Mobile phase: Methanol and water (1:1)

Standard solution: 0.075 mg/mL of nitroglycerin from USP Diluted Nitroglycerin RS in *Mobile phase*

Sample solution: Transfer a portion of Diluted Nitroglycerin, equivalent to 7.5 mg of nitroglycerin, to a 100-mL volumetric flask, and dissolve in 75 mL of *Mobile phase*. If necessary, sonicate for 2 min or until the solid is totally dispersed, then shake by mechanical means for 30 min. Dilute with *Mobile phase* to volume, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L1. [NOTE—If necessary a short precolumn that contains packing L1 may be used.]

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: NMT 2.5 for the analyte peak

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_3H_5N_3O_9$ in the portion of Diluted Nitroglycerin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of nitroglycerin in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES**Organic Impurities**• **PROCEDURE**

Standard solution: 400 µg/mL of nitroglycerin from USP Diluted Nitroglycerin RS in methanol

Sample solution A: Prepare a clear solution containing 400 µg/mL of nitroglycerin from Diluted Nitroglycerin in methanol.

Sample solution B: 20 mg/mL of nitroglycerin in methanol from Diluted Nitroglycerin. Centrifuge a portion, if necessary, to obtain a clear liquid phase.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 μ L each of *Sample solution A* and *Sample solution B*; 5, 10, 15, and 20 μ L of the *Standard solution*

Developing solvent system: Toluene and ethyl acetate (4:1)

Spray reagent: Diphenylamine in methanol (1 in 100)

Analysis

Samples: *Standard solution*, *Sample solution A*, and *Sample solution B*

Apply the *Samples* to a suitable thin-layer chromatographic plate. Develop the chromatograms in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with *Spray reagent*, and irradiate the plate with short- and long-wavelength UV light for 15 min.

Acceptance criteria: Any spot from *Sample solution B*, other than the principal spot, is not more intense than the spot from the 20- μ L application of the *Standard solution*. Compare the intensities of any secondary spots observed from *Sample solution B* with those of the principal spots from the *Standard solution* (corresponding to 0.5%, 1.0%, 1.5%, and 2.0%, respectively): the sum of the intensities of the secondary spots from *Sample solution B* is NMT 3%. [NOTE—Nitrates of glycerin typically have R_f values of 0.21, 0.37, and 0.61 for mono-, di-, and tri-substituted glycerins, respectively.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and prevent exposure to excessive heat. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS (11)**
USP Diluted Nitroglycerin RS

Nitroglycerin Injection

DEFINITION

Nitroglycerin Injection is a sterile solution prepared from Diluted Nitroglycerin; the solvent may contain Alcohol, Propylene Glycol, and Water for Injection. Nitroglycerin Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$).

IDENTIFICATION

- **A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Methanol and water (500:500)

Standard solution: 0.075 mg/mL of nitroglycerin from USP Diluted Nitroglycerin RS in *Mobile phase*

Sample solution: Transfer a measured volume of Injection equivalent to 7.5 mg of nitroglycerin to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; packing L1

[NOTE—If necessary, a short precolumn that contains packing L1 may be used.]

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of nitroglycerin in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method II (611)**

Sample: Use isopropyl alcohol as the internal standard.

Acceptance criteria: 90.0%–110.0% of the labeled amount of C_2H_5OH

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.1 USP Endotoxin Unit/ μ g of nitroglycerin
- **PH (791)**
Sample: To 5 mL of the Injection add 5 mL of water and 1 drop of saturated potassium chloride solution.
Acceptance criteria: 3.0–6.5
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.
- **LABELING:** Where necessary, label it to indicate that it is to be diluted before use.
- **USP REFERENCE STANDARDS (11)**
USP Diluted Nitroglycerin RS
USP Endotoxin RS

Nitroglycerin Ointment

DEFINITION

Nitroglycerin Ointment is Diluted Nitroglycerin in a suitable ointment base. It contains NLT 90.0% and NMT 115.0% of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$).

IDENTIFICATION

- **A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Methanol and water (500:500)

Standard solution: 0.075 mg/mL of nitroglycerin from USP Diluted Nitroglycerin RS in *Mobile phase*

Sample solution: Transfer a quantity of Ointment equivalent to 2.0 mg of nitroglycerin to a glass-stoppered, 50-mL conical flask, and add 25.0 mL of *Mobile phase*. Immerse the flask containing the sample in a water bath maintained at a temperature of 50° for 10

min. Shake intermittently until the sample is dispersed. Remove the flask from the bath, and shake vigorously for 1 min to obtain a coagulated solid. Repeat the heating and shaking steps one more time, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L1

[NOTE—If necessary, a short precolumn that contains packing L1 may be used.]

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$) in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of nitroglycerin in the *Standard solution* (mg/mL)

C_U = nominal concentration of nitroglycerin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS

- **MINIMUM FILL (755):** Meets the requirements

- **HOMOGENEITY**

Analysis: In the case of single-dose containers, perform the Assay on specimens from each of 10 containers. In the case of multiple-dose containers, perform the Assay on one sample from the top and one from the bottom of each of five containers.

Acceptance criteria: Each sample contains NLT 90.0% and NMT 110.0% of the mean value.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label multiple-dose containers with a direction to close tightly immediately after each use.
- **USP REFERENCE STANDARDS (11)**
USP Diluted Nitroglycerin RS

Nitroglycerin Sublingual Tablets

DEFINITION

Nitroglycerin Sublingual Tablets contain NLT 90.0% and NMT 115.0% of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Standard solution: Equivalent to 1 mg/mL of nitroglycerin in acetone from USP Diluted Nitroglycerin RS

Sample solution: Equivalent to 1 mg/mL of nitroglycerin from powdered Sublingual Tablets, in acetone.

Shake by mechanical means for 30 min, and filter.

Developing solvent system: Toluene, ethyl acetate, and glacial acetic acid (16:4:1)

Analysis: Proceed as directed. Spray with a solution (1 in 100) of diphenylamine in methanol, and irradiate the

plate with short- and long-wavelength UV light for 10 min.

Acceptance criteria: Meets the requirements

- **B.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Methanol and water (50:50)

Standard solution: 0.075 mg/mL of nitroglycerin from USP Diluted Nitroglycerin RS in *Mobile phase*

Sample solution: Nominally equivalent to 0.075 mg/mL of nitroglycerin from powdered Sublingual Tablets (NLT 20 Sublingual Tablets) in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L1. [NOTE—If necessary, use a short precolumn that contains packing L1.]

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: NMT 2.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$) in the portion of Sublingual Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of nitroglycerin in the *Standard solution* (mg/mL)

C_U = nominal concentration of nitroglycerin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS

- **DISINTEGRATION (701)**

Determined as set forth for Sublingual Tablets

Time: 2 min

Acceptance criteria: Meets the requirements

- **UNIFORMITY OF DOSAGE UNITS (905)**

Procedure for content uniformity

Mobile phase, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Sample solution: 0.075 mg/mL of nitroglycerin in *Mobile phase*, from 1 Sublingual Tablet

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nitroglycerin ($C_3H_5N_3O_9$) in the Sublingual Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of nitroglycerin in the *Standard solution* (mg/mL)

C_U = nominal concentration of nitroglycerin in the *Sample solution* (mg/mL)

Acceptance criteria: The content of each of the 10 Sublingual Tablets is within the range of 75.0%–135.0% of the labeled claim. If the content of NMT 1 Sublingual Tablet is outside the range of 75.0%–135.0% and if the content of none of the Sub-

lingual Tablets is outside the range of 60.0%–150.0%, test 20 additional units. The requirements are met if the content of each of the additional 20 units falls within the range of 75.0%–135.0% of the labeled claim.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, preferably of glass, and store at controlled room temperature. Each container holds NMT 100 Sublingual Tablets.
- **LABELING:** The labeling indicates that the Sublingual Tablets are for sublingual use, and the label directs that the Sublingual Tablets be dispensed in the original, unopened container, labeled with the following statement directed to the patient. "Warning: To prevent loss of potency, keep these tablets in the original container or in a supplemental nitroglycerin container specifically labeled as being suitable for Nitroglycerin Sublingual Tablets. Close tightly immediately after each use."
- **USP REFERENCE STANDARDS (11)**
USP Diluted Nitroglycerin RS

Nitromersol

$C_7H_5HgNO_3$ 351.71
7-Oxa-8-mercurabicyclo[4.2.0]octa-1,3,5-triene, 5-methyl-2-nitro-;
5-Methyl-2-nitro-7-oxa-8-mercurabicyclo[4.2.0]octa-1,3,5-triene [133-58-4].

DEFINITION

Nitromersol, dried at 105° for 2 h, contains NLT 98.0% and NMT 100.5% of nitromersol ($C_7H_5HgNO_3$).

IDENTIFICATION

- **A.**
Sample solution: 1 mg/mL in 1 N sodium hydroxide
Analysis: The *Sample solution* possesses a reddish-orange color. Add 3 N hydrochloric acid.
Acceptance criteria: The reddish orange color disappears, and a yellowish, flocculent precipitate forms.
- **B.**
Sample solution: Dissolve 250 mg of Nitromersol in 2.5 mL of 1 N sodium hydroxide, and dilute with water to 20 mL.
Analysis 1: Add 3 mL of 3 N hydrochloric acid to the *Sample solution*.
Acceptance criteria 1: A yellowish precipitate is formed.
Analysis 2: Filter the solution obtained after *Analysis 1*. The filtrate is nearly colorless or slightly yellow. Retain the filtrate for the test for *Mercury Ions*. Dissolve the precipitate in 20 mL of water to which 2.5 mL of 1 N sodium hydroxide has been added. Add 0.5 g of sodium hydrosulfite, and heat to boiling.
Acceptance criteria 2: A heavy deposit of metallic mercury is formed.

ASSAY

• PROCEDURE

Sample: 200 mg of Nitromersol, previously ground to a fine powder and dried

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N ammonium thiocyanate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 500-mL Kjeldahl flask. Add 15 mL of sulfuric acid, and digest cautiously with occasional swirling over a flame until the solution becomes a clear, light yellowish brown. Cool, and add, dropwise, enough 30% hydrogen peroxide to decolorize the solution. Digest for 2–3 min, adding more hydrogen peroxide if necessary, to produce a colorless solution. Cool, dilute with water to 100 mL, and add potassium permanganate TS until a permanent pink color persists on heating. Then add hydrogen peroxide TS, dropwise, until the color is completely discharged. Cool, and add 5 mL of nitric acid that has been diluted with 10 mL of water. Add 5 mL of ferric ammonium sulfate TS, and titrate with *Titrant*. Each mL of 0.1 N ammonium thiocyanate is equivalent to 17.59 mg of nitromersol ($C_7H_5HgNO_3$).

Acceptance criteria: 98.0%–100.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

• MERCURY IONS

Sample solution: The filtrate obtained in *Identification test B, Analysis 2*

Analysis: Add an equal volume of hydrogen sulfide TS to the *Sample solution*.

Acceptance criteria: No darkening in color is produced, although a small amount of a flocculent, light yellow precipitate may form.

• ALKALI-INSOLUBLE SUBSTANCES

Sample: 1.0 g of Nitromersol

Analysis: Add 7 mL of 1 N sodium hydroxide to the *Sample*, then dilute with water to 20 mL. The resulting solution, upon standing in a glass-stoppered vessel in the dark for 24 h, shows NMT a slight amount of insoluble material. Collect the insoluble residue, if any, in a tared filter crucible, wash the residue with warm water, and dry at 105° for 1 h.

Acceptance criteria: 0.1%; the weight of the insoluble material is NMT 1 mg.

• UNCOMBINED NITROCRESOL

Sample: 500 mg of Nitromersol

Analysis: Shake the *Sample* with 50 mL of benzene, filter, evaporate the filtrate in a tared dish to dryness, and dry the residue at 80° for 2 h.

Acceptance criteria: 1%; the weight of the residue is NMT 5 mg.

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Nitromersol Topical Solution

DEFINITION

Nitromersol Topical Solution yields NLT 180.0 mg and NMT 220.0 mg of nitromersol ($C_7H_5HgNO_3$) in each 100 mL.

Nitromersol	2 g
Sodium Hydroxide	0.4 g
Sodium Carbonate, Monohydrate	4.25 g
Purified Water, a sufficient quantity to make	1000 mL

Dissolve the *Sodium Hydroxide* and the *Sodium Carbonate, Monohydrate* in 50 mL of *Purified Water*. Add the *Nitromersol*, and stir until dissolved. Gradually add *Purified Water* to make 1000 mL.

[NOTE—Prepare dilutions of *Nitromersol Topical Solution* as needed, because they tend to precipitate upon standing.]

IDENTIFICATION

- **A.**
Sample: 100 mL
Analysis: Add 3 mL of 3 N hydrochloric acid to the *Sample*.
Acceptance criteria: A yellowish precipitate is formed. Filter, and retain both the filtrate and the precipitate.
- **B.**
Sample: The precipitate obtained from *Identification test A*.
Analysis: Add the *Sample* to 20 mL of water and 2.5 mL of 1 N sodium hydroxide. Add 500 mg of sodium hydrosulfite, and heat to boiling.
Acceptance criteria: A heavy deposit of metallic mercury is formed.

ASSAY

• PROCEDURE

Sample: 50.0 mL of *Topical Solution*

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N ammonium thiocyanate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 500-mL Kjeldahl flask, add a few glass beads, and evaporate to 5 mL. Add 15 mL of sulfuric acid, digest cautiously with occasional swirling over a flame until the solution becomes a clear, light yellowish brown. Cool, and add, dropwise, enough 30% hydrogen peroxide to decolorize the solution. Digest for 2–3 min, adding more hydrogen peroxide, if necessary, to produce a colorless solution. Cool, dilute with water to 100 mL, and add potassium permanganate TS until a permanent pink color persists on heating. Then add hydrogen peroxide TS, dropwise, until the color is completely discharged. Cool, and add 5 mL of nitric acid that has been diluted with 10 mL of water. Add 5 mL of ferric ammonium sulfate TS, and titrate with *Titrant*. Each mL of *Titrant* is equivalent to 17.59 mg of nitromersol ($C_7H_5HgNO_3$).

Acceptance criteria: 180.0–220.0 mg of nitromersol ($C_7H_5HgNO_3$) in each 100 mL

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 1.005–1.010

• MERCURY IONS

Sample: The filtrate obtained from *Identification test A*

Analysis: To the *Sample* add an equal volume of hydrogen sulfide TS.

Acceptance criteria: No darkening in color is produced, although a small amount of a flocculent, light yellow precipitate may be formed.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers.

Nitrous Oxide

N_2O 44.01

Nitrogen oxide (N_2O).

Nitrogen oxide (N_2O) [10024-97-2].

» Nitrous Oxide contains not less than 99.0 percent, by volume, of N_2O .

Packaging and storage—Preserve in cylinders.

NOTE—The following tests are designed to reflect the quality of Nitrous Oxide in both the vapor and liquid phases that are present in previously unopened cylinders. Reduce the container pressure by means of a regulator. Withdraw the samples for the tests with the least possible release of Nitrous Oxide consistent with proper purging of the sampling apparatus. Measure the gases with a gas volume meter downstream from the detector tubes in order to minimize contamination or change of the specimens. Perform tests in the sequence in which they are listed.

The various detector tubes called for in the respective tests are listed under *Reagents* in the section *Reagents, Indicators, and Solutions*.

Identification—

A: With the container temperatures the same and maintained between 15° and 25°, concomitantly read the pressure of the Nitrous Oxide container and of a container of nitrous oxide certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*). [NOTE—Do not use the nitrous oxide certified standard if it has been depleted to less than half of its full capacity.] The pressure of the Nitrous Oxide container is within 50 psi of that of the nitrous oxide certified standard.

B: Pass 100 ± 5 mL released from the vapor phase of the contents of the Nitrous Oxide container through a carbon dioxide detector tube at the rate specified for the tube: no color change is observed (*distinction from carbon dioxide*).

C: Collect about 100 mL of the gas under test in a 100-mL tube fitted at the top with a stopcock. Open the stopcock, and quickly add a freshly prepared solution of 500 mg of pyrogallol in 2 mL of water and a freshly prepared solution of 12 g of potassium hydroxide in 8 mL of water. Immediately close the stopcock, and mix: the gas is not absorbed, and the solution does not become brown (*distinction from oxygen*).

Water—It meets the requirements of the test for *Water* under *Carbon Dioxide*.

Limit of ammonia—Proceed with Nitrous Oxide as directed in the test for *Carbon monoxide*, except to use an ammonia detector tube: the indicator change corresponds to not more than 0.0025%.

Limit of nitric oxide—Pass 500 ± 50 mL, released from the vapor phase of the contents of the container, through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 1 ppm.

Carbon monoxide—Pass 1000 ± 50 mL, released from the vapor phase of the contents of the container, through a carbon monoxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 0.001%.

Nitrogen dioxide—Arrange a container so that when its valve is opened, a portion of the liquid phase of the contents is released through a piece of tubing of sufficient length to allow all of the liquid to vaporize during passage through it, and to prevent frost from reaching the inlet of the detector tube. Release into the tubing a flow of liquid sufficient to provide 550 mL of the vaporized sample plus any excess necessary to ensure adequate flushing of air from the system. Pass 550 ± 50 mL of this gas through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 1 ppm.

Halogens—Pass 1000 ± 50 mL, released from the vapor phase of the contents of the container, through a chlorine detector tube at the rate specified for the tube: the indicator change corresponds to not more than 1 ppm.

Carbon dioxide—Pass 1000 ± 50 mL, released from the vapor phase of the contents of the container, through a carbon dioxide detector tube at the rate specified for the

tube: the indicator change corresponds to not more than 0.03%.

Air—Not more than 1.0% of air is present, determined as directed in the Assay.

Assay—Introduce a specimen of Nitrous Oxide taken from the liquid phase, as directed in the test for Nitrogen dioxide, into a gas chromatograph by means of a gas-sampling valve. Select the operating conditions of the gas chromatograph such that the peak response resulting from the following procedure corresponds to not less than 70% of the full-scale reading. Preferably, use an apparatus corresponding to the general type in which the column is 6 m in length and 4 mm in inside diameter and is packed with porous polymer beads, which permits complete separation of N₂ and O₂ from N₂O, although the N₂ and O₂ may not be separated from each other. Use industrial grade helium (99.99%) as the carrier gas, with a thermal-conductivity detector, and control the column temperature: the peak response produced by the assay specimen exhibits a retention time corresponding to that produced by an air-helium certified standard (see under *Reagents* in the section *Reagents, Indicators, and Solutions*), and is equivalent to not more than 1.0% of air when compared to the peak response of the air-helium certified standard, indicating not less than 99.0%, by volume, of N₂O.

Nizatidine

C₁₂H₂₁N₅O₂S₂ 331.46

1,1-Ethenediamine, N-[2-[[[2-[(dimethylamino)methyl]-4-thiazolyl)methyl]thio]ethyl]-N'-methyl-2-nitro-N-[2-[[[2-[(Dimethylamino)methyl]-4-thiazolyl)methyl]thio]ethyl]-N'-methyl-2-nitro-1,1-ethenediamine [76963-41-2].

» Nizatidine contains not less than 98.0 percent and not more than 101.0 percent of C₁₂H₂₁N₅O₂S₂, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nizatidine RS

Identification—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation as obtained in the Assay.

Loss on drying (731)—Dry about 2 g, accurately weighed, at 100° for 1 hour: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II** (231): 0.001%. • (Official 1-Jan-2018)

Chromatographic purity—

Solution A—Use Buffer solution prepared as directed in the Assay.

Solution B—Use methanol.

Diluent—Prepare a mixture of Solution A and Solution B (76:24).

Mobile phase—Use variable mixtures of Solution A and Solution B as directed for the Chromatographic system. Make adjustments if necessary (see *System Suitability* under Chromatography (621)).

Standard solutions—Dissolve an accurately weighed quantity of USP Nizatidine RS quantitatively, and stepwise if necessary, in Diluent, sonicating if necessary, to obtain a solution having a known concentration of 50 µg per mL (Standard solution 1). Quantitatively dilute portions of Standard solution 1 with Diluent to obtain Standard solution 2 and Standard solution 3 having known concentrations of 25 µg per mL and 15 µg per mL, respectively.

Test solution—Prepare a solution of Nizatidine in Diluent having a concentration of about 5 mg per mL.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–3	76	24	isocratic
3–20	76→50	24→50	linear gradient
20–45	50	50	isocratic
45–50	50→76	50→24	linear gradient
50–70	76	24	isocratic

Make adjustments to the composition of the Mobile phase, if necessary, to obtain a retention time of about 12 minutes for the main nizatidine peak (see *System Suitability* under Chromatography (621)). Chromatograph Standard solution 1, and record the peak areas as directed for Procedure: the tailing factor is not more than 2.0.

Procedure—Separately inject equal volumes (about 50 µL) of Standard solution 1, Standard solution 2, Standard solution 3, and the Test solution into the chromatograph, and allow the Test solution to elute for not less than three times the retention time of nizatidine. Record the chromatograms, and measure the areas for all the peaks. The sum of the peak areas, excluding the nizatidine peak area, obtained from the Test solution is not more than three times the main peak area obtained from Standard solution 2; and no single peak area obtained from the Test solution is greater than the main peak area obtained from Standard solution 3; not more than 0.3% of any individual impurity is found; and not more than 1.5% of total impurities is found.

Assay—

Buffer solution—Prepare a 0.1 M solution by dissolving 5.9 g of ammonium acetate in 760 mL of water. Add 1 mL of diethylamine, and adjust with acetic acid to a pH of 7.5.

Mobile phase—Prepare a filtered and degassed mixture of Buffer solution and methanol (76:24). Make adjustments if necessary (see *System Suitability* under Chromatography (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Nizatidine RS in Mobile phase, sonicating if necessary, to obtain a solution having a known concentration of about 0.3 mg per mL.

Assay preparation—Transfer an accurately weighed quantity of 15 mg of Nizatidine to a 50-mL volumetric flask, dissolve in Mobile phase, sonicating if necessary, dilute with Mobile phase to volume, and mix.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak areas as directed for Procedure: the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than

2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{12}H_{21}N_5O_2S_2$ in the portion of Nizatidine taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Nizatidine RS in the *Standard preparation*; and r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nizatidine Capsules

» Nizatidine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nizatidine ($C_{12}H_{21}N_5O_2S_2$).

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards (11)—

USP Nizatidine RS

Identification—

A: Empty the contents of 2 Capsules into a beaker, add 20 mL of methanol, and swirl for approximately 2 minutes. Filter through a filter paper, and evaporate the methanol solution with a current of cool air to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Nizatidine RS.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{12}H_{21}N_5O_2S_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 314 nm using filtered portions of the solution under test, diluted with water if necessary, in comparison with a *Standard solution* having a known concentration of USP Nizatidine RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{12}H_{21}N_5O_2S_2$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—[NOTE—Use peak areas where peak responses are indicated.]

Buffer solution and Mobile phase—Prepare as directed in the *Assay under Nizatidine*.

Standard solution—Dissolve an accurately weighed quantity of USP Nizatidine RS in *Mobile phase* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 40 μ g per mL.

Test solution—Remove as completely as possible the contents of not less than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of nizatidine, to a 100-mL volumetric flask, add 50 mL of *Mobile phase*, and sonicate for about 3 minutes. Dilute with *Mobile phase* to volume, mix, and filter.

System suitability solution—Prepare a solution of nizatidine and phenol in *Mobile phase* containing 40 μ g of each per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm \times 15-cm column that contains 5- μ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed under *Procedure*: the resolution, R , between the nizatidine and phenol peaks is not less than 1.5, the tailing factor for the nizatidine peak is not greater than 1.5, and the relative standard deviation of the nizatidine peak for replicate injections is not more than 2%.

Procedure—Chromatograph about 10 μ L of the *Standard solution* and the *Test solution*, and run the chromatograph for twice the elution time of nizatidine. Record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Capsules taken by the formula:

$$2(r_i / r_s)$$

in which r_i is the response of each impurity peak in the *Test solution*, and r_s is the response of the nizatidine peak in the *Standard solution*: not more than 0.5% of any individual impurity and not more than 1.5% of total impurities is found.

Assay—[NOTE—Use peak areas where peak responses are indicated.]

Buffer solution and Mobile phase—Prepare as directed in the *Assay under Nizatidine*.

Internal standard solution—Prepare a solution of phenol in *Mobile phase* having a concentration of 0.1 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Nizatidine RS in *Internal standard solution* to obtain a solution having a known concentration of 0.1 mg per mL.

Assay preparation—Weigh accurately not less than 10 Capsules. Remove as completely as possible the contents of the Capsules, and mix the combined contents. Clean and accurately weigh the Capsule shells, and calculate the net weight of the Capsule contents. Transfer an accurately weighed portion of the mixed Capsule contents equivalent to about 500 mg of nizatidine to a 500-mL volumetric flask, add 200 mL of *Internal standard solution*, and sonicate for a few minutes. Cool, dilute with *Internal standard solution* to volume, and mix. Filter a portion of the solution, transfer 1.0 mL of the filtered solution to a 10-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm \times 15-cm column that contains 5- μ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between nizatidine and the internal standard phenol, is not less than 3; the tailing factor, T , for the nizatidine peak is not more than 1.6; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for phenol and 1.0 for nizatidine. Calculate the quantity, in mg, of $C_{12}H_{21}N_5O_2S_2$ in the portion of Capsules taken by the formula:

$$5000C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Nizatidine RS in the *Standard preparation*, and R_U and R_S are the ratios of the peak response of the nizatidine to that of the internal standard for the *Assay preparation* and the *Standard preparation*, respectively.

Nonoxynol 9

α -(*p*-Nonylphenyl)- ω -hydroxynona(oxyethylene)
[26027-38-3].

DEFINITION

Nonoxynol 9 is an anhydrous liquid mixture consisting chiefly of monononylphenyl ethers of polyethylene glycols corresponding to the formula:

in which the average value of n is 9. It contains NLT 90.0% and NMT 110.0% of nonoxynol 9.

IDENTIFICATION

- **A. INFRARED ABSORPTION:** Its IR absorption spectrum, obtained by spreading a capillary film of it between sodium chloride plates, exhibits maxima at 1117 cm^{-1} (strong); at 1512, 1582, and 1610 cm^{-1} (medium, sharp); at 2871, 2928, and 2956 cm^{-1} (strong, unresolved); at 831 cm^{-1} (medium, broad); and at 1250 cm^{-1} (medium, sharp).
- **B.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Methanol and water (80:20)

System suitability solution: 25 mg/mL each of octoxynol 9 and USP Nonoxynol 9 RS in *Mobile phase*

Standard solution: 25 mg/mL of USP Nonoxynol 9 RS in *Mobile phase*

Sample solution: 25 mg/mL of Nonoxynol 9 in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 25-cm; 10- μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

[NOTE—Nonoxynol oligomers elute as a major peak, usually with shoulders and bumps. Include these in the peak response for Nonoxynol 9.]

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the responses for Nonoxynol 9, including any shoulders and bumps.

Calculate the percentage of Nonoxynol 9 in the portion of specimen taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nonoxynol 9 from the *Sample solution*

r_S = peak response of nonoxynol 9 from the *Standard solution*

C_S = concentration of USP Nonoxynol 9 RS in the *Standard solution* (mg/mL)

C_U = concentration of Nonoxynol 9 in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

FREE ETHYLENE OXIDE

Stripped nonoxynol 9: Maintain Nonoxynol 9 at a temperature of 150° with constant stirring in an open vessel until it no longer displays a peak for ethylene oxide when chromatographed as directed below.

System suitability solution: 10 $\mu\text{g}/\text{mL}$ each of ethylene oxide and acetaldehyde in *Stripped nonoxynol 9*

Standard stock solutions: [NOTE—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated hood, using great care.] Chill all apparatus and reagents used in the solution of standards in a refrigerator or freezer before use. Fill a chilled pressure bottle with liquid ethylene oxide from a lecture bottle, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Transfer 100 mL of chilled isopropyl alcohol to a 500-mL volumetric flask. Using a chilled graduated cylinder, transfer 25 mL of ethylene oxide to the isopropyl alcohol, and swirl gently to mix. Dilute with additional chilled isopropyl alcohol to volume, replace the stopper, and swirl gently to mix. This stock solution contains 43.6 mg/mL of ethylene oxide.

Pipet 25 mL of 0.5 N alcoholic hydrochloric acid, prepared by mixing 45 mL of hydrochloric acid with 1 L of alcohol, into a 500-mL conical flask containing 40 g of magnesium chloride hexahydrate. Shake the mixture to effect saturation. Pipet 10 mL of the ethylene oxide solution into the flask, and add 20 drops of bromocresol green TS. If the solution is not yellow (acid), add an additional volume of 0.5 N alcoholic hydrochloric acid to give an excess of 10 mL. Record the total volume of 0.5 N alcoholic hydrochloric acid added. Insert the stopper in the flask, and allow to stand for 30 min. Titrate the excess acid with 0.5 N alcoholic potassium hydroxide VS. Perform a blank titration, using 10.0 mL of isopropyl alcohol instead of ethylene oxide solution, adding the same total volume of 0.5 N alcoholic hydrochloric acid, and note the difference in volumes required. Each mL of the difference in volumes of 0.5 N alcoholic potassium hydroxide consumed is equivalent to 22.02 mg of ethylene oxide. Calculate the concentration, in mg/mL, of ethylene oxide in the stock solution. Standardize daily. Store in a refrigerator.

Prepare a 1000-ppm standard by pipeting the calculated volume (2 mL) of cold stock solution that, on the basis of the standardization, contains 88.6 mg of ethylene oxide, into a container and adding 87.0 g of *Stripped nonoxynol 9*. Prepare 10-, 5-, and 0.5-ppm standards by quantitatively diluting the 1000-ppm standard with additional *Stripped nonoxynol 9*.

Standard solutions: Transfer 5 ± 0.01 g of each *Standard stock solution* to suitable serum vials equipped with pressure-tight septum closures designed to relieve any excessive pressure, and seal them.

Sample solution: Transfer 5 ± 0.01 g of Nonoxynol 9 to a serum vial of the same kind as the vials used for the *Standard solutions*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 6.4-m \times 2.1-mm nickel; packed with 60- to 80-mesh support S9

Temperatures

Detector: 200°

Injection port: 160°

Column: 100°

Carrier gas: Helium

Flow rate: 30 mL/min

Injection volume: 100 µL

System suitability**Samples:** *System suitability solution* and *Standard solutions*

Calibration: Place the vial containing the 10-ppm ethylene oxide *Standard solution* in an oven, and heat at 90° for 30 min. Remove the vial from the oven. Using a gas-tight syringe, immediately inject a 100-µL aliquot of the headspace gas into the gas chromatograph. Obtain the area for the ethylene oxide peak (retention time about 8 min). Raise the temperature of the column to 200° after ethylene oxide elutes to volatilize heavy components. Re-equilibrate the column at 100°. Repeat the foregoing steps, using the vials containing the 5- and 0.5-ppm *Standard solution*. Plot area units versus ppm of ethylene oxide for the standards on linear graph paper, and draw the best straight line through the points.

Suitability requirements**Resolution:** NLT 1.5 between ethylene oxide and acetaldehyde, *System suitability solution***Calibration:** None of the points used for constructing the straight line *Calibration* curve deviates from the line by more than 10%.**Analysis****Samples:** *Standard solutions* and *Sample solution*

Place the vial containing the *Sample solution* in an oven, and heat at 90° for 30 min. Remove the vial from the oven. Immediately inject a 100-µL aliquot of the headspace gas into the gas chromatograph, and obtain the area for the ethylene oxide peak.

Calculate the concentration of ethylene oxide in the sample specimen in ppm:

$$\text{Result} = r_U \times S$$

 r_U = peak area from the *Sample solution* S = slope of the standard curve (ppm/area unit)**Acceptance criteria:** NMT 1 ppm**• LIMIT OF DIOXANE**

Apparatus: Assemble a closed-system vacuum distillation apparatus (see Figure 1), using glass vacuum stopcocks (A, B, and C). The concentrator tube (D)¹ is made of borosilicate or quartz (not flint) glass, graduated precisely enough to measure the 0.9 mL or more of distillate collected, and marked so that the analyst can dilute accurately to 2.0 mL.

Standard solution: 100 µg/mL of dioxane in water. Use a freshly prepared solution.

Sample solution: Transfer 20.0 g to a 50-mL round-bottom flask (E) having a 24/40 ground-glass neck joint. Add 1.0 mL of water. Place a small polytetrafluoroethylene-covered stirring bar in the flask, insert the stopper, and stir to mix. Immerse the flask in an ice bath, and chill for 1 min. Wrap heating tape around the tube connecting the concentrator tube (D) and the round-bottom flask, and apply 10 V to the tape. Apply a light coating of high-vacuum silicone grease to the ground-glass joints, and connect the concentrator tube to the 10/30 joint and the round-bottom flask to the 24/40 joint. Immerse the vacuum trap in a Dewar flask filled with liquid nitrogen,

close stopcocks A and B, open stopcock C, and begin evacuating the system with a vacuum pump. Prepare a slurry bath from powdered dry ice and methanol, and raise the bath to the neck of the round-bottom flask. After freezing the contents of the flask for 10 min, and when the vacuum system is operating at a 0.05-mm pressure or lower, open stopcock A for 20 s, then close it. Remove the slurry bath, and allow the flask to warm in air for 1 min. Immerse the flask in a water bath maintained at a temperature between 20° and 25°, and after 5 min warm the water bath to between 35° and 40° (sufficient to liquefy most specimens) while stirring slowly but constantly with the magnetic bar. Cool the water in the bath by adding ice, and chill for 2 min. Replace the water bath with the slurry bath, freeze the contents of the round-bottom flask for 10 min, open stopcock A for 20 s, and then close it. Remove the slurry bath, and repeat the heating steps as before, this time reaching a final temperature between 45° and 50° or a temperature necessary to melt the specimen completely. If there is any condensation in the tube connecting the round-bottom flask to the concentrator tube, slowly increase the voltage to the heating tape, and heat until condensation disappears.

Stir with the magnetic stirrer throughout the following steps. Very slowly immerse the concentrator tube in a Dewar flask containing liquid nitrogen. **[CAUTION—**When there is liquid distillate in the concentrator tube, immerse the tube in the liquid nitrogen very slowly, or the tube will break.] Water will begin to distill into the concentrator tube. As ice forms in the concentrator tube, raise the Dewar flask to keep the liquid nitrogen level only slightly below the level of ice in the tube. When water begins to freeze in the neck of the 10/30 joint, or when liquid nitrogen reaches the 2.0-mL graduation mark on the concentrator tube, remove the Dewar flask, and allow the ice to melt without heating. After the ice has melted, check the volume of water that has distilled, and repeat the sequence of chilling and thawing until NLT 0.9 mL of water has been collected. Freeze the tube once again for 2 min, and release the vacuum first by opening stopcock B, followed by opening stopcock A. Remove the concentrator tube from the apparatus, close it with a greased stopper, and allow the ice to melt without heating. Mix the contents of the concentrator tube by swirling, note the volume of distillate, and dilute with water to 2.0 mL, if necessary.

Figure 1. Closed-System Vacuum Distillation Apparatus for Dioxane

¹ A suitable tube is available as Chromaflex concentrator tube, Kontes Glass Co., Vineland, NJ (Catalog No. K42560-0000).

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.8-m glass; contains support S10

Temperatures

Detector: 250°

Injection port: 200°

Column: 140°

Carrier gas: Nitrogen or helium

Flow rate: 35 mL/min

Injection volume: 2–4 µL

Install an oxygen scrubber between the carrier gas line and the column. Condition the column for 72 h at 230° with 30–40 mL/min carrier flow. [NOTE—Support S10 is oxygen sensitive. Each time a column is installed, flush with carrier gas for 30–60 min before heating.]

AnalysisSamples: *Standard solution* and *Sample solution*

Acceptance criteria: The height of the peak of the *Sample solution* is NMT that of the *Standard solution*, corresponding to NMT 10 µg/g.

SPECIFIC TESTS• **POLYETHYLENE GLYCOL**

Sample: 10 g

Analysis: Transfer the *Sample* to a 250-mL beaker. Add 100 mL of ethyl acetate, and stir on a magnetic stirrer to effect solution. Transfer, with the aid of 100 mL of 5 N sodium chloride, to a pear-shaped, 500-mL separator fitted with a glass stopper. Insert the stopper, and shake vigorously for 1 min. Remove the stopper carefully to release the pressure. Immerse a thermometer in the mixture, and support the separator so that it is partially immersed in a water bath maintained at 50°. Swirl the separator gently while letting the internal temperature rise to between 40° and 45°, then immediately remove the separator from the bath, dry the outside surface, and drain the salt (lower) layer into another pear-shaped, 500-mL separator. In the same manner, extract the ethyl acetate layer a second time with 100 mL of fresh 5 N sodium chloride, combining the two aqueous extracts. Discard the ethyl acetate layer. Wash the combined aqueous layers with 100 mL of ethyl acetate, using the same technique, and drain the salt (lower) layer into a clean pear-shaped, 500-mL separator. Discard the ethyl acetate layer. Extract the aqueous layer with two successive 100-mL portions of chloroform, draining the chloroform (lower) layers through Whatman folded filter paper 2V, and combining them into a 250-mL beaker. Evaporate on a steam bath to dryness, and continue heating until the odor of chloroform is no longer perceptible. Allow the beaker to cool. Add 25 mL of acetone, and dissolve the residue on a magnetic stirrer. Filter through Whatman folded filter paper 2V into a tared 250-mL beaker, rinsing with two 25-mL portions of acetone. Evaporate on a steam bath to dryness. Dry under vacuum at 60° for 1 h. Allow the beaker to cool, and weigh.

Acceptance criteria: NMT 1.0% of polyethylene glycol

• **CLOUD POINT**

Sample: 1.0 g

Analysis: Transfer the *Sample* to a 250-mL beaker, add 99 g of water, and mix to dissolve. Pour 30 mL of the resulting solution into a 70-mL test tube. Support the test tube in a hot water bath, and stir the contents with a thermometer constantly until the solution becomes cloudy, then remove the test tube from the bath immediately so that the temperature rises NMT 2° further, and continue stirring. The cloud point is the temperature at which the solution becomes sufficiently clear that the entire thermometer bulb is seen plainly.

Acceptance criteria: 52°–56°

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.2
- **WATER DETERMINATION**, *Method I* (921): NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

USP Nonoxynol 9 RS

Norelgestromin

$C_{21}H_{29}NO_2$ 327.46
18,19-Dinorpregn-4-en-20-yn-3-one, 13-ethyl-17-hydroxy-, oxime, (17 α)-;
13-Ethyl-17-hydroxy-18,19-dinor-17 α -pregn-4-en-20-yn-3-one oxime [53016-31-2].

DEFINITION

Norelgestromin is a mixture of (*E*)- and (*Z*)-isomers having a ratio of (*E*)- to (*Z*)-isomer between 1.3 and 1.6, and the sum of both isomers is NLT 98.0% and NMT 102.0% of norelgestromin ($C_{21}H_{29}NO_2$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY• **PROCEDURE**

Mobile phase: Cyclohexane and absolute alcohol (100:2)

Diluent: Cyclohexane and absolute alcohol (90:10)

System suitability solution: 1.5 mg/mL of USP Norelgestromin RS and 8 µg/mL of USP Norelgestromin Related Compound A RS in *Diluent*

Standard solution: 1.5 mg/mL of USP Norelgestromin RS in *Diluent*

Sample solution: 1.5 mg/mL of Norelgestromin in *Diluent*

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L20

Column temperature: 50°

Flow rate: 1.2 mL/min

Injection volume: 25 µL

Run time: 1.6 times the retention time of (*Z*)-norelgestromin

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for the (*Z*)-isomer of norelgestromin related compound A, (*E*)-norelgestromin, and (*Z*)-norelgestromin are about 0.77, 0.85, and 1.00, respectively.]

Suitability requirements

Resolution: NLT 1.4 between the (*Z*)-isomer of norelgestromin related compound A and (*E*)-norelgestromin, *System suitability solution*

Tailing factor: 0.8–1.2 for both (E)- and (Z)-norelgestromin, *System suitability solution* and *Standard solution*

Relative standard deviation: NMT 0.73% for both (E)- and (Z)-norelgestromin, *System suitability solution* and *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of norelgestromin ($C_{21}H_{29}NO_2$) in the portion of Norelgestromin taken:

$$\text{Result} = \{[(r_{UE} \times F) + r_{UZ}]/[(r_{SE} \times F) + r_{SZ}]\} \times (C_S/C_U) \times 100$$

r_{UE} = peak response of (E)-norelgestromin from the *Sample solution*

F = response factor for (E)-norelgestromin, 1.04

r_{UZ} = peak response of (Z)-norelgestromin from the *Sample solution*

r_{SE} = peak response of (E)-norelgestromin from the *Standard solution*

r_{SZ} = peak response of (Z)-norelgestromin from the *Standard solution*

C_S = concentration of USP Norelgestromin RS in the *Standard solution* (mg/mL)

C_U = concentration of Norelgestromin in the *Sample solution* (mg/mL)

Calculate the ratio of (E)- to (Z)-norelgestromin:

$$\text{Result} = (r_{UE} \times F)/r_{UZ}$$

r_{UE} = peak response of (E)-norelgestromin from the *Sample solution*

F = response factor for (E)-norelgestromin, 1.04

r_{UZ} = peak response of (Z)-norelgestromin from the *Sample solution*

Acceptance criteria

Both isomers: 98.0%–102.0% on the anhydrous basis
Ratio of (E)- to (Z)-isomer: 1.3–1.6

IMPURITIES

• **RESIDUE ON IGNITION (281):** NMT 0.2%

• ORGANIC IMPURITIES

Mobile phase, Diluent, *System suitability solution*, *Standard solution*, *Sample solution*, and *Chromatographic system*: Proceed as directed in the *Assay*.

Sensitivity solution: 1.5 µg/mL of USP Norelgestromin RS in *Diluent* from the *Standard solution*

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 1.4 between the (Z)-isomer of norelgestromin related compound A and (E)-norelgestromin, *System suitability solution*

Tailing factor: 0.8–1.2 for both (E)- and (Z)-norelgestromin, *System suitability solution* and *Standard solution*

Relative standard deviation: NMT 0.73% for both (E)- and (Z)-norelgestromin, *System suitability solution* and *Standard solution*

Signal-to-noise ratio: NLT 3 for both (E)- and (Z)-norelgestromin, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Norelgestromin taken:

$$\text{Result} = \{r_U/[(r_{SE} \times F) + r_{SZ}]\} \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_{SE} = peak response of (E)-norelgestromin from the *Standard solution*

F = response factor for (E)-norelgestromin, 1.04

r_{SZ} = peak response of (Z)-norelgestromin from the *Standard solution*

C_S = concentration of USP Norelgestromin RS in the *Standard solution* (mg/mL)

C_U = concentration of Norelgestromin in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. Disregard peaks that are less than 0.05% of the total peak areas of (E)- and (Z)-norelgestromin.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

1,2-Benzenediol, 4-(2-amino-1-hydroxyethyl)-, (R)-, [R-(R*, R*)]-2,3-dihydroxybutanedioate (1:1) (salt), monohydrate; (–)-α-(Aminomethyl)-3,4-dihydroxybenzyl alcohol tartrate (1:1) (salt), monohydrate [108341-18-0].

Anhydrous [51-40-1].

DEFINITION

Norepinephrine Bitartrate contains NLT 97.0% and NMT 102.0% of $C_8H_{11}NO_3 \cdot C_4H_6O_6$, calculated on the anhydrous basis.

IDENTIFICATION• **A. INFRARED ABSORPTION** (197K)• **B. PROCEDURE**

Sample solution: 5 mg/mL in water

Analysis: Add 1 drop of ferric chloride TS.

Acceptance criteria: An intensely green color develops.

• **C. PROCEDURE**

Sample solution: 0.01 µg/mL

Analysis: Add 1.0 mL of 0.10 N iodine to 10 mL of the Sample solution. Allow to stand for 5 min, and add 2.0 mL of 0.10 N sodium thiosulfate.

Acceptance criteria: The solution is colorless, or has at most a slight pink or slight violet color (epinephrine and isoproterenol at the same pH, about 3.5, give a strong red-brown or violet color).

ASSAY• **PROCEDURE**

Sample solution: 25 mg/mL of Norepinephrine Bitartrate in glacial acetic acid. If necessary warm slightly to effect solution.

Analysis: Add 2 drops of crystal violet TS to the Sample solution, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 31.93 mg of $C_8H_{11}NO_3 \cdot C_4H_6O_6$.

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES**Inorganic Impurities**• **RESIDUE ON IGNITION** (281): NMT 0.1%, from 200 mg**Organic Impurities**• **PROCEDURE: LIMIT OF ARTERENONE**

USP Norepinephrine Bitartrate RS

Norepinephrine Bitartrate Injection

» Norepinephrine Bitartrate Injection is a sterile solution of Norepinephrine Bitartrate in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of norepinephrine ($C_8H_{11}NO_3$).

Packaging and storage—Preserve in single-dose, light-resistant containers, preferably of Type I glass.

Labeling—Label the Injection in terms of mg of norepinephrine per mL, and, where necessary, label it to indicate that it must be diluted prior to use. The label indicates that

the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

USP Reference standards (11)—

USP Endotoxin RS

USP Norepinephrine Bitartrate RS

Color and clarity—

Standard solution—Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Visually examine a portion of the Injection (*Test solution*) in a suitable clear glass test tube against a white background: it is not pinkish and it contains no precipitate. If any yellow color is observed in the *Test solution*, concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm: the absorbance of the *Test solution* does not exceed that of the *Standard solution*.

Identification—

A: It responds to Identification test B under Norepinephrine Bitartrate.

B: Dilute the Injection with water to a concentration of 1 mg in 5 mL. To 10 mL of the dilution add 2.0 mL of 0.10 N iodine, allow to stand for 5 minutes, then add 3.0 mL of 0.10 N sodium thiosulfate: the solution is colorless or has at most a slight pink or slight violet color (epinephrine and isoproterenol at the same pH, about 3.5, give a red-brown or violet color).

Bacterial Endotoxins Test (85)—It contains not more than 83.4 USP Endotoxin Units per mg of norepinephrine.

pH (791): between 3.0 and 4.5.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Dissolve 1.1 g of sodium 1-heptanesulfonate in 800 mL of water. Add 200 mL of methanol, and adjust with 1 M phosphoric acid to a pH of 3.0 ± 0.1 . Pass through a membrane filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Norepinephrine Bitartrate RS in freshly prepared dilute acetic acid (1 in 25), and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.4 mg of norepinephrine bitartrate monohydrate per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of norepinephrine, to a 25-mL volumetric flask, add dilute acetic acid (1 in 25) to volume, and mix.

System suitability preparation—Dissolve a suitable quantity of isoproterenol hydrochloride in the *Standard preparation* to obtain a solution containing, in each mL, 0.4 mg of USP Norepinephrine Bitartrate RS and 0.4 mg of isoproterenol hydrochloride.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm \times 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed under *Procedure*: the tailing factor for the analyte peak is not more than 2.5, the resolution, *R*, between the norepinephrine and isoproterenol peaks is not less than 4.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of norepinephrine ($C_8H_{11}NO_3$) in each mL of the Injection taken by the formula:

$$(169.18 / 337.29)(25C / V)(r_U / r_S)$$

in which 169.18 and 337.29 are the molecular weights of norepinephrine and norepinephrine bitartrate monohydrate, respectively; C is the concentration, in mg per mL, of USP Norepinephrine Bitartrate RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Norethindrone

$C_{20}H_{26}O_2$ 298.42

19-Norpregn-4-en-20-yn-3-one, 17-hydroxy-, (17 α)-
17-Hydroxy-19-nor-17 α -pregn-4-en-20-yn-3-one
[68-22-4].

» Norethindrone contains not less than 97.0 percent and not more than 102.0 percent of $C_{20}H_{26}O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Norethindrone RS

Completeness of solution—The solution called for in the test for *Specific rotation* is clear and free from undissolved solid.

Identification, Infrared Absorption (197K).

Melting range (741): between 202° and 208°.

Specific rotation (781S): between −30° and −38°.

Test solution: 20 mg per mL, in dioxane.

Loss on drying (731)—Dry it in vacuum at 105° for 3 hours: it loses not more than 0.5% of its weight.

Limit of ethynyl group—Dissolve 200 mg in about 40 mL of tetrahydrofuran. Add 10 mL of silver nitrate solution (1 in 10), and titrate with 0.1 N sodium hydroxide VS, either a glass-calomel or a silver-silver chloride electrode system with potassium nitrate filling solution. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 2.503 mg of ethynyl group ($-C\equiv CH$). Not less than 8.18% and not more than 8.43% of ethynyl group is found.

Chromatographic purity—

Test solution—Prepare a solution of Norethindrone in chloroform to contain 10 mg per mL.

Standard solutions—Prepare a solution of USP Norethindrone RS in chloroform to contain 10 mg per mL (*Standard stock solution*). Dilute accurately measured volumes of *Standard stock solution* with chloroform to obtain *Standard solutions A, B, C, and D* having known concentrations of 150, 50, 30, and 10 μ g per mL, respectively.

Procedure—Separately apply 10 μ L of the *Test solution* and 10 μ L of each *Standard solution* to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of chloroform and methanol (95:5) until the solvent front has moved about three-fourths of the length of the

plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a mixture of methanol and sulfuric acid (7:3), then heat the plate at 100° for 5 minutes: the R_f value of the principal spot from the *Test solution* corresponds to that of the principal spot from *Standard solution A*. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solution*: no secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution B* (0.5%), and the sum of the intensities of the secondary spots obtained from the *Test solution* is not more intense than the principal spot obtained from *Standard solution A* (1.5%).

Assay—Dissolve about 100 mg of Norethindrone, accurately weighed, in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a solution containing about 10 μ g per mL. Dissolve an accurately weighed quantity of USP Norethindrone RS in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a *Standard solution* having a known concentration of about 10 μ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, using alcohol as the blank. Calculate the quantity, in mg, of $C_{20}H_{26}O_2$ in the portion of Norethindrone taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Norethindrone RS in the *Standard solution*, and A_U and A_S are the absorbances of the solution of Norethindrone and the *Standard solution*, respectively.

Norethindrone Tablets

DEFINITION

Norethindrone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of norethindrone ($C_{20}H_{26}O_2$).

IDENTIFICATION

• A. INFRARED ABSORPTION

Analysis: Mix an amount of powdered Tablets equivalent to 50 mg of norethindrone with 15 mL of solvent hexane. Stir the solution occasionally for 15 min. Centrifuge the mixture, then decant and discard the solvent hexane. Extract the residue with two 10-mL portions of solvent hexane, centrifuging and decanting as before, and discard the solvent hexane. Add 25 mL of chloroform to the residue, mix by shaking for 1–2 min, and filter. Evaporate the filtrate to about 3 mL, add a few mL of solvent hexane to induce crystallization, and evaporate to dryness.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion prepared from the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Norethindrone RS.

ASSAY

• PROCEDURE

Solution A: Dissolve 1.0 g of isoniazid in 1000 mL of anhydrous methanol, and add 1.3 mL of hydrochloric acid.

Standard stock solution: 14 μ g/mL of USP Norethindrone RS in methanol

Standard solution: Transfer 10.0 mL of the *Standard stock solution* to a suitable container, add 2.0 mL of *Solution A*, mix, seal, and allow to stand for 30 min.

Sample stock solution: Transfer an amount of finely powdered Tablets equivalent to 0.7 mg of norethindrone (powder NLT 20 Tablets) to a 50-mL volumetric flask, and add anhydrous methanol to volume. Mix, and allow to stand for 10 min, with occasional mixing. Filter a portion of the mixture to clarify the solution. Use the filtrate.

Sample solution: Transfer 10.0 mL of the *Sample stock solution* to a suitable container. Add 2.0 mL of *Solution A*, mix, seal, and allow to stand for 30 min.

Sample blank solution: Transfer 10.0 mL of the *Sample stock solution* to a suitable container, add 2.0 mL of methanol, and mix.

Reagent blank solution: Transfer 10.0 mL of methanol to a suitable container, add 2.0 mL of *Solution A*, mix, seal, and allow to stand for 30 min.

Instrumental conditions

Mode: UV

Analytical wavelength: 380 nm

Analysis

Samples: *Standard solution*, *Sample solution*, *Sample blank solution*, and *Reagent blank solution*

Concomitantly determine the absorbances of these solutions, using methanol as the reference for the *Sample blank solution*, and using the *Reagent blank solution* as the reference for the *Sample solution* and the *Standard solution*.

Calculate the percentage of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) in the portion of Tablets taken:

$$\text{Result} = (A_U - A_{UB})/A_S \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_{UB} = absorbance of the *Sample blank solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Norethindrone RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of norethindrone in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: 0.09% Sodium lauryl sulfate in 0.1 N hydrochloric acid; 500 mL, deaerated

Apparatus 2: 75 rpm

Time: 30 min

Mobile phase: Acetonitrile and water (2:3)

Standard stock solution: 0.07 mg/mL of USP Norethindrone RS in methanol. Sonication may be used to aid dissolution.

Standard solution: ($L/500$) mg/mL of USP Norethindrone RS in *Medium* from the *Standard stock solution*, where L is the claim in mg/Tablet of norethindrone

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of norethindrone in the *Standard solution* (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.09% Sodium lauryl sulfate in 0.1 N hydrochloric acid; 500 mL, deaerated

Apparatus 2: 75 rpm

Time: 45 min

Mobile phase: Acetonitrile and 0.02 M phosphate buffer pH 6.0 (35:65)

Standard stock solution: 0.028 mg/mL of USP Norethindrone RS in methanol

Standard solution: ($L/500$) mg/mL of USP Norethindrone RS in *Medium* from the *Standard stock solution*, where L is the claim in mg/Tablet of norethindrone

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μm pore size or centrifuge at least 10 mL of the solution under test and use the supernatant.

Use one of the following two chromatographic systems.

(See *Chromatography* (621), *System Suitability*.)

Chromatographic system 1

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm \times 10-cm; 3- μm packing L1

Flow rate: 1 mL/min

Injection volume: 100 μL

Chromatographic system 2

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm \times 10-cm; 3- or 3.5- μm packing L1

Flow rate: 2 mL/min

Injection volume: 100 μL

System suitability

Use this *System suitability* for either *Chromatographic system 1* or *Chromatographic system 2*.

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of norethindrone in the *Standard solution* (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.5% Sodium lauryl sulfate in 0.1 N hydrochloric acid; 500 mL, deaerated

Apparatus 2: 75 rpm

Time: 20 min

Mobile phase: Acetonitrile and water (50:50)

Standard stock solution: 0.028 mg/mL of USP Norethindrone RS in methanol. Sonication may be used to aid dissolution.

Standard solution: ($L/500$) mg/mL of USP Norethindrone RS in *Medium* from the *Standard stock solution*, where L is the claim in mg/Tablet of norethindrone

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size or centrifuge and use the supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1.3 mL/min

Injection volume: 100 μ L

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of norethindrone in the Standard solution (mg/mL)

V = volume of Medium, 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of norethindrone ($C_{20}H_{26}O_2$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)
USP Norethindrone RS

Norethindrone and Ethinyl Estradiol Tablets

» Norethindrone and Ethinyl Estradiol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norethindrone ($C_{20}H_{26}O_2$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ethinyl estradiol ($C_{20}H_{24}O_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Ethinyl Estradiol RS

USP Norethindrone RS

Identification—Crush 1 Tablet in 1 mL of alcohol in a 15-mL conical centrifuge tube, and warm to 50° for 10 minutes with gentle swirling. Cool, and centrifuge to obtain a clear solution. Apply 20 μ L of this test solution and 20 μ L of an alcohol solution containing, in each mL, about 1 mg of USP Norethindrone RS and about 50 μ g of USP Ethinyl Estradiol RS at equidistant points along a line about 2.5 cm from the bottom of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel and previously activated by heat-

ing at 105° for 30 minutes. Develop the chromatogram in a mixture of toluene and ethyl acetate (4:1) in a suitable chamber, previously equilibrated with the solvent mixture, until the solvent front has moved about 10 cm. Remove the plate, and air-dry. Spray the plate with sulfuric acid-methanol, prepared by cautiously adding 70 mL of sulfuric acid in small increments to 30 mL of methanol chilled in an ice-bath, and mixing; the spots from the test solution have the same R_f values as the spots from USP Ethinyl Estradiol RS and from USP Norethindrone RS.

Dissolution (711)—[NOTE—Exercise care in filtering and handling solutions containing ethinyl estradiol to prevent adsorptive loss of the drug. Centrifugation may be used instead of filtration with nonadsorptive membrane filters. Withdraw dissolution aliquots with glass or polytet pipets or syringes that have been checked for adsorptive loss. Use glass dissolution vessels and polytet-coated or solid polytet paddles.]

Medium: 0.09% sodium dodecyl sulfate in 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amounts of norethindrone ($C_{20}H_{26}O_2$) and ethinyl estradiol ($C_{20}H_{24}O_2$) dissolved, employing the following method.

Mobile phase—Prepare a degassed and filtered mixture of 0.02 M pH 6.0 phosphate buffer and acetonitrile (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector, and a 5-mm \times 8.3-cm column that contains 3- μ m packing L1. The flow rate is about 1 mL per minute. Chromatograph replicate injections of a filtered portion of a Standard solution of USP Norethindrone RS and USP Ethinyl Estradiol RS in *Dissolution Medium* having concentrations similar to those expected in the solution under test. [NOTE—A volume of methanol not exceeding 4% of the total final volume of the Standard solution may be used in preparing the Standard solution.] Record the peak responses as directed for *Procedure*: the resolution, R , for norethindrone and ethinyl estradiol is not less than 1.5; the minimum number of theoretical plates for the ethinyl estradiol peak is not less than 7000; the tailing factor does not exceed 2.0 for either peak; and the relative standard deviation is not more than 3.0%.

Procedure—Separately inject equal volumes (about 100 μ L) of the Standard solution and a filtered portion of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.9 for norethindrone and 1.0 for ethinyl estradiol. Calculate the quantities of norethindrone ($C_{20}H_{26}O_2$) and ethinyl estradiol ($C_{20}H_{24}O_2$) dissolved by comparison of the corresponding peak responses obtained from the Standard solution and the solution under test.

Tolerances—Not less than 75% (Q) of each of the labeled amounts of $C_{20}H_{26}O_2$ and $C_{20}H_{24}O_2$, respectively, are dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements for *Content Uniformity* with respect to norethindrone and to ethinyl estradiol.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Transfer about 15 mg of valerophenone into a 250-mL volumetric flask, add 125 mL of acetonitrile, dilute with water to volume, and mix.

Ethinyl estradiol standard stock solution—Dissolve an accurately weighed quantity of USP Ethinyl Estradiol RS in acetonitrile, and dilute quantitatively and stepwise with acetonitrile.

trile to obtain a solution having a known concentration of about 0.09 mg per mL.

Norethindrone standard stock solution—Using an accurately weighed quantity of USP Norethindrone RS, prepare a solution in acetonitrile having a known concentration of about 1.25 mg per mL.

Mixed standard preparation—Transfer 5.0 mL of *Internal standard solution* into a 100-mL volumetric flask. Add accurately measured volumes of *Ethinyl estradiol standard stock solution* and *Norethindrone standard stock solution* so that the final known concentrations, in mg per mL, of the Reference Standards correspond numerically to about one-twentieth of the labeled amounts of the corresponding ingredients in the Tablets. Add $(26 - X)$ mL of acetonitrile, X being the total volume of the *standard stock solution* taken. Dilute with a mixture of acetonitrile and water (45 in 100) to volume, and mix.

Assay preparation—Transfer 10 Tablets to a 100-mL volumetric flask, add 20 mL of water, and shake by mechanical means until the tablets are completely disintegrated. Add 10.0 mL of *Internal standard solution* and 60 mL of acetonitrile, and mix. Sonicate for about 2 minutes. Dilute with acetonitrile to volume, and mix. Allow solid particles to settle, or centrifuge if necessary to obtain a slightly turbid solution. Dilute 5.0 mL of this solution with a mixture of acetonitrile and water (45 in 100) to 10.0 mL, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm \times 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between the norethindrone and ethinyl estradiol peaks is not less than 2.0; the column efficiency determined from the internal standard peak is not less than 8000 theoretical plates; and the relative standard deviation for six replicate injections is not more than 2.0% (both peaks).

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.9 for ethinyl estradiol and 1.0 for norethindrone. Calculate the quantities, in mg, of norethindrone ($C_{20}H_{26}O_2$) and ethinyl estradiol ($C_{20}H_{24}O_2$) in each Tablet taken by the formula:

$$20C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Mixed standard preparation*, and R_U and R_S are the peak response ratios, at corresponding retention times, obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Norethindrone and Mestranol Tablets

» Norethindrone and Mestranol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norethindrone ($C_{20}H_{26}O_2$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mestranol ($C_{21}H_{26}O_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Mestranol RS

USP Norethindrone RS

Identification—Crush 1 Tablet in 1 mL of alcohol in a 15-mL conical centrifuge tube, and centrifuge briefly. Apply 10 μ L of this test solution and 10 μ L each of solutions containing, respectively, about 1 mg per mL of USP Norethindrone RS in alcohol and about 50 μ g per mL of USP Mestranol RS in alcohol at equidistant points along a line about 2.5 cm from the bottom of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel and previously activated by heating at 105° for 30 minutes. Develop the chromatogram in a mixture of equal volumes of ethyl acetate and cyclohexane in a suitable chamber, previously equilibrated with the solvent mixture, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, air-dry, and observe under short-wavelength UV light: the principal spot from the test solution appears at the same R_f value as the principal spot from USP Norethindrone RS, at about R_f 0.6. Spray the plate with a sulfuric acid and methanol mixture prepared by cautiously adding and mixing sulfuric acid in small increments to 30 mL of chilled anhydrous methanol in a 100-mL volumetric flask. Adjust to room temperature, dilute with sulfuric acid to volume, and mix. Heat the plate at 105° for 10 minutes: the pink spot from the test solution appears at the same R_f value as the pink spot from USP Mestranol RS (about R_f 0.8).

Dissolution (711)—[NOTE—Exercise care in filtering solutions containing mestranol to prevent adsorptive loss of the drug. Centrifugation may be used instead of filtration with nonadsorptive membrane filters. Withdraw dissolution aliquots with glass or polytetrafluoroethylene pipets or syringes that have been checked for adsorptive loss. Use glass dissolution vessels and polytetrafluoroethylene-coated or solid polytetrafluoroethylene paddles.]

Medium: 0.09% sodium lauryl sulfate in 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amounts of norethindrone ($C_{20}H_{26}O_2$) and mestranol ($C_{21}H_{26}O_2$) dissolved, employing the following method.

Mobile phase—Prepare a degassed and filtered mixture of water and acetonitrile (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm \times 25-cm column that contains packing L10. The flow rate is about 1 mL per minute. Chromatograph replicate injections of a filtered portion of a *Standard solution* of USP Norethindrone RS and USP Mestranol RS in *Dissolution Medium* having known concentrations similar to those expected in the solution under test, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 3.0%. The minimum number of theoretical plates for the mestranol peak is 4000, and the tailing factors for the norethindrone and mestranol peaks do not exceed 1.5.

Procedure—Separately inject equal volumes (about 200 μ L) of the *Standard solution* and a filtered portion of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.4 for norethindrone and 1.0 for mestranol. Calculate the quantities of norethindrone and mestranol dissolved by comparison of the corresponding peak responses obtained from the *Standard solution* and the test solutions.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{20}H_{26}O_2$ and 75% (Q) of the labeled amount of $C_{21}H_{26}O_2$ are dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements for *Content Uniformity* with respect to norethindrone and to mestranol.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Transfer about 80 mg of progesterone into a 100-mL volumetric flask, add 50 mL of acetonitrile, dilute with water to volume, and mix.

Mestranol standard stock solution—Dissolve an accurately weighed quantity of USP Mestranol RS in acetonitrile, and dilute quantitatively and stepwise with acetonitrile to obtain a solution having a known concentration of about 0.05 mg per mL.

Norethindrone standard stock solution—Using an accurately weighed quantity of USP Norethindrone RS, prepare a solution in acetonitrile having a known concentration of about 1 mg per mL.

Standard preparation—Transfer 2.0 mL of *Internal standard solution* into a 100-mL volumetric flask. Add accurately measured volumes of *Mestranol standard stock solution* and *Norethindrone standard stock solution* so that the final known concentrations, in mg per mL, of the Reference Standards correspond numerically to about one-fiftieth of the labeled amounts of the corresponding ingredients in the Tablets. Add 50 mL of water, dilute with acetonitrile to volume, and mix.

Assay preparation—Transfer 10 Tablets to a 250-mL volumetric flask, add 50 mL of water, and shake by mechanical means until the Tablets are completely disintegrated. Add 10.0 mL of *Internal standard solution* and 165 mL of acetonitrile, and mix. Sonicate for about 2 minutes. Dilute with acetonitrile to volume, and mix. Allow solid particles to settle, or centrifuge if necessary, to obtain a slightly turbid solution. Transfer 5.0 mL of this solution to a 10-mL volumetric flask, add 1.0 mL of acetonitrile, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the mestranol peak is not less than 6000 theoretical plates, the resolution, R , between the progesterone and mestranol peaks is not less than 5.0, and the relative standard deviation for six replicate injections is not more than 2.0% (both peaks).

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 2.5 for mestranol and 1.0 for norethindrone. Calculate the quantities, in mg, of norethindrone ($C_{20}H_{26}O_2$) and mestranol ($C_{21}H_{26}O_2$) in each Tablet taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*, and R_U and R_S are the peak response ratios, at corresponding retention times, obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Norethindrone Acetate

$C_{22}H_{28}O_3$ 340.46

19-Norpregn-4-en-20-yn-3-one, 17-(acetyloxy)-, (17 α).

17-Hydroxy-19-nor-17 α -pregn-4-en-20-yn-3-one acetate [51-98-9].

» Norethindrone Acetate contains not less than 97.0 percent and not more than 103.0 percent of $C_{22}H_{28}O_3$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Norethindrone Acetate RS

Completeness of solution—The solution prepared for the determination of *Specific rotation* is clear and free from undissolved solids.

Identification, Infrared Absorption (197K).

Specific rotation (781S): between -32° and -38° .

Test solution: 20 mg per mL, in dioxane.

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Limit of ethynyl group—Proceed as directed in the test for *Ethynyl group* under *Norethindrone*. Not less than 7.13% and not more than 7.57% of ethynyl group is found.

Chromatographic purity—

TEST 1—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Prepare a solution of Norethindrone Acetate in chloroform having a concentration of 10 mg per mL.

Standard stock solution—Prepare a solution of USP Norethindrone Acetate RS in chloroform having a known concentration of 10 mg per mL.

Standard solutions—Dilute accurately measured volumes of the *Standard stock solution* with chloroform to obtain *Standard solutions A, B, C, and D* having known concentrations of 150 μ g per mL, 50 μ g per mL, 30 μ g per mL, and 10 μ g per mL, respectively.

Application volume: 10 μ L, as two 5- μ L portions.

Developing solvent system: a mixture of toluene and ethyl acetate (1:1).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621), except to apply the solutions along a line 2.5 cm from the edge of the plate.

Spray the plate with a mixture of methanol and sulfuric acid (7:3), and heat at 100° for 5 minutes. The *Test solution* exhibits a principal spot at the same R_f value as the principal spot of *Standard solution A*. Any individual secondary spot is not more intense than the spot in the chromatogram obtained from *Standard solution B*: not more than 0.5% of any individual impurity is found, and the total of impurities found is not more than 1.5%.

TEST 2—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (6:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Dissolve accurately weighed quantities of desoxycorticosterone acetate and USP Norethindrone Acetate RS in *Mobile phase* to obtain a solution having concentrations of about 80 μ g of each per mL.

Test solution—Transfer about 62.5 mg of Norethindrone Acetate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.83 for desoxycorticosterone acetate and 1.0 for norethindrone acetate; and the resolution, R , between desoxycor-

ticosterone acetate and norethindrone acetate is not less than 3.5.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Diluted test solution* and the *Test solution* into the chromatograph, record the chromatograms for twice the retention time of norethindrone acetate, and measure all of the peak areas. Calculate the percentage of each impurity in the portion of Norethindrone Acetate taken by the formula:

$$r_i / r_s$$

in which r_i is the peak area for each impurity obtained from the *Test solution*; and r_s is the sum of all the peaks obtained from the *Diluted test solution*. [NOTE—Exclude any peak having a response that is less than 0.025%.] Not more than 0.5% of any individual impurity is found; and not more than 1.0% of total impurities is found.

Assay—Transfer about 100 mg of Norethindrone Acetate, accurately weighed, to a 200-mL volumetric flask, add alcohol to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with alcohol to volume, and mix. Dissolve an accurately weighed quantity of USP Norethindrone Acetate RS in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a Standard solution having a known concentration of about 10 μ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of $C_{22}H_{28}O_3$ in the portion of Norethindrone Acetate taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Norethindrone Acetate RS in the Standard solution, and A_U and A_S are the absorbances of the solution of Norethindrone Acetate and the Standard solution, respectively.

Norethindrone Acetate Tablets

» Norethindrone Acetate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norethindrone acetate ($C_{22}H_{28}O_3$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Norethindrone Acetate RS

Identification—It responds to the *Identification* test under *Norethindrone Tablets*, USP Norethindrone Acetate RS being used to prepare the Standard preparation.

Dissolution (711)—

Medium: dilute hydrochloric acid (1 in 100) containing 0.02% of sodium lauryl sulfate; 900 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{22}H_{28}O_3$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 248 nm, measured from a baseline drawn from 350 nm through 310 nm and extending beyond the peak maximum, of filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Norethindrone Acetate RS in the same medium. [NOTE—The Standard solution may be prepared by dissolving the Reference Standard in a volume of methanol, not exceeding

0.5% of the final volume of the solution, and diluting quantitatively with *Dissolution Medium*.]

Tolerances—Not less than 70% (Q) of the labeled amount of $C_{22}H_{28}O_3$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Transfer 1 finely powdered Tablet to a 100-mL volumetric flask with the aid of about 75 mL of alcohol. Heat the alcohol to boiling, and allow the mixture to remain at a temperature just below the boiling point for about 15 minutes, with occasional swirling. Cool to room temperature, dilute with alcohol to volume, mix, and centrifuge a portion of the contents at about 2000 rpm until the solution becomes clear. Dilute a portion of the supernatant quantitatively and stepwise with alcohol to obtain a solution containing approximately 10 μ g of norethindrone acetate per mL. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Norethindrone Acetate RS in alcohol having a known concentration of about 10 μ g per mL in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of $C_{22}H_{28}O_3$ in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which T is the labeled quantity, in mg, of norethindrone acetate in the Tablet, C is the concentration, in μ g per mL, of USP Norethindrone Acetate RS in the Standard solution, D is the concentration, in μ g per mL, of the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution, and A_U and A_S are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of norethindrone acetate, to a separator, add 10 mL of water, and extract with three 25-mL portions of chloroform, filtering each extract through chloroform-washed cotton. Evaporate the combined chloroform extracts on a steam bath to dryness, reducing the heat as dryness is approached. Dissolve the residue in alcohol, transfer the solution to a 100-mL volumetric flask, dilute with alcohol to volume, and mix. Transfer a 5.0-mL aliquot to a 100-mL volumetric flask, dilute with alcohol to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Norethindrone Acetate RS in alcohol having a known concentration of about 10 μ g per mL in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of $C_{22}H_{28}O_3$ in the portion of Tablets taken by the formula:

$$2C(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Norethindrone Acetate RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Tablets and the Standard solution, respectively.

Norethindrone Acetate and Ethinyl Estradiol Tablets

DEFINITION

Norethindrone Acetate and Ethinyl Estradiol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of norethindrone acetate ($C_{22}H_{28}O_3$), and NLT 88.0% and NMT 112.0% of the labeled amount of ethinyl estradiol ($C_{20}H_{24}O_2$).

IDENTIFICATION

A. The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY**PROCEDURE**

Mobile phase: Acetonitrile, methanol, and water (40:5:55)

Diluent: Acetonitrile and water (1:1)

Standard solution: 90 µg/mL of USP Norethindrone Acetate RS and 1.76 µg/mL of USP Ethinyl Estradiol RS in *Diluent*

Sample solution: Transfer an appropriate number of Tablets, NLT 20, to a volumetric flask, such that the final concentration is 100 µg/mL of norethindrone acetate based on the label claim. Fill the flask with *Diluent* to about 75% of volume, and disintegrate the Tablets by mechanical shaking and sonication. Allow the solution to equilibrate to room temperature, and dilute with *Diluent* to volume. Centrifuge a portion of the solution using glass centrifuge tubes, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethinyl estradiol and norethindrone acetate are about 0.28 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 10.0 between ethinyl estradiol and norethindrone acetate

Tailing factor: NMT 2.0 for ethinyl estradiol and norethindrone acetate

Relative standard deviation: NMT 2.0% for ethinyl estradiol and norethindrone acetate

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of norethindrone acetate (C₂₂H₂₈O₃) and ethinyl estradiol (C₂₀H₂₄O₂) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the corresponding analyte from the *Sample solution*

r_S = peak response of the corresponding analyte from the *Standard solution*

C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (µg/mL)

C_U = nominal concentration of the corresponding analyte in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of norethindrone acetate (C₂₂H₂₈O₃); 88.0%–112.0% of the labeled amount of ethinyl estradiol (C₂₀H₂₄O₂)

PERFORMANCE TESTS**DISSOLUTION (711)**

0.025 M acetate buffer solution: Transfer 5.22 g of anhydrous sodium acetate and 2.2 g of glacial acetic acid to a 4-L volumetric flask, add 3.5 L of water, and adjust with 1 N sodium hydroxide to a pH of 5.0 ± 0.2. Dilute with water to volume.

Medium: 0.025 M acetate buffer solution with 0.15% sodium lauryl sulfate, prepared by weighing 6 g of sodium lauryl sulfate into a 4-L volumetric flask, adding

1.5 L of 0.025 M acetate buffer solution, mixing, and diluting with 0.025 M acetate buffer solution to volume; 600 mL

Apparatus 2: 75 rpm

Time: 60 min

Mobile phase: 0.2% phosphoric acid, acetonitrile, and tetrahydrofuran (540:380:80)

Standard solution: USP Norethindrone Acetate RS and USP Ethinyl Estradiol RS dissolved in a minimum amount of acetonitrile, and diluted with *Medium* to obtain a solution having known concentrations equivalent to the expected concentrations of the solution under test

Sample solution: Withdraw a 2-mL aliquot, using a glass pipet or syringe, and centrifuge at about 2000 rpm for about 5 min. Use the supernatant as the *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 242 nm detector and a fluorescence detector with an excitation wavelength set at 210 nm and an emission wavelength set at 310 nm

Column: 6-mm × 40-mm; 3-µm packing L1

Guard column: 4-mm × 12.5-mm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 200 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 500 theoretical plates for ethinyl estradiol and NLT 1400 theoretical plates for norethindrone acetate

Tailing factor: NMT 2.0 for norethindrone acetate and ethinyl estradiol

Relative standard deviation: NMT 2.5% for norethindrone acetate and ethinyl estradiol

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 80% (Q) of the labeled amounts of norethindrone acetate (C₂₂H₂₈O₃) and ethinyl estradiol (C₂₀H₂₄O₂) is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
USP Ethinyl Estradiol RS
USP Norethindrone Acetate RS

Norfloxacin

C₁₆H₁₈FN₃O₃ 319.33
3-Quinolincarboxylic acid, 1-ethyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-;
1-Ethyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolincarboxylic acid [70458-96-7].

DEFINITION

Norfloxacin contains NLT 98.0% and NMT 102.0% of norfloxacin (C₁₆H₁₈FN₃O₃), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: Water adjusted with phosphoric acid to a pH of 2.0

Diluent: Acetonitrile and *Solution A* (5:95)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Acetonitrile (%)
0	95	5
5	95	5
7	93	7
10	87	13
15	47	53
20	10	90
20.1	95	5
25	95	5

Standard solution: 0.1 mg/mL of USP Norfloxacin RS in *Diluent*. Sonicate, if necessary, to dissolve.

Sample solution: 0.1 mg/mL of Norfloxacin in *Diluent*. Sonicate, if necessary, to dissolve.

Solution A, Diluent, Mobile phase, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability stock solution: 0.01 mg/mL each of USP Norfloxacin Related Compound K RS, USP Norflox-

acin Related Compound E RS, USP Norfloxacin Related Compound A RS, and USP Norfloxacin Related Compound H RS in *Diluent* prepared as follows. Dissolve 1 mg each of USP Norfloxacin Related Compound K RS, USP Norfloxacin Related Compound E RS, USP Norfloxacin Related Compound A RS, and USP Norfloxacin Related Compound H RS in 10 mL of acetonitrile in a 100-mL volumetric flask. Add about 70 mL of *Diluent*. Sonicate, if necessary, to dissolve. Dilute with *Diluent* to volume.

System suitability solution: To 1 mg of USP Norfloxacin RS in a 10-mL volumetric flask add 5 mL of *System suitability stock solution*. Sonicate, if necessary, to dissolve. Dilute with *Diluent* to volume.

Standard solution: 0.4 μg/mL of USP Norfloxacin RS in *Diluent*

Sample solution: 0.4 mg/mL of Norfloxacin in *Diluent*. Sonicate, if necessary, to dissolve.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between norfloxacin related compound E and norfloxacin; NLT 3.0 between norfloxacin related compound A and norfloxacin related compound H, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Norfloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Norfloxacin RS in the *Standard solution* (μg/mL)

C_U = concentration of Norfloxacin in the *Sample solution* (mg/mL)

F = conversion factor, 0.001 mg/μg

Acceptance criteria: See *Table 2*. Disregard any peak less than 0.05%.

Table 2

Name	Relative Retention Time (min)	Acceptance Criteria, NMT (%)
Norfloxacin related compound K	0.85	0.15
Norfloxacin related compound E	0.95	0.15
Norfloxacin	1.0	—
Norfloxacin related compound A	1.4	0.10
Norfloxacin related compound H	1.43	0.10
Unidentified impurity	1.0	0.10
Total impurities	1.0	0.5

SPECIFIC TESTS• **LOSS ON DRYING (731)**

Analysis: Dry at 100° to constant weight.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

- USP Norfloxacin RS
 USP Norfloxacin Related Compound A RS
 7-Chloro-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid.

 $C_{16}H_{18}ClN_3O_3$ 335.79
 USP Norfloxacin Related Compound H RS
 7-[4-(Ethoxycarbonyl)piperazin-1-yl]-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid.
 $C_{19}H_{22}FN_3O_5$ 391.39
 USP Norfloxacin Related Compound K RS
 6-Fluoro-1-methyl-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid.
 $C_{15}H_{16}FN_3O_3$ 305.30

Norfloxacin Ophthalmic Solution

» Norfloxacin Ophthalmic Solution is a sterile, aqueous solution of Norfloxacin. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Packaging and storage—Preserve in tight, light-resistant containers, stored at controlled room temperature.

USP Reference standards (11)—

USP Norfloxacin RS

Identification—

A: Ultraviolet Absorption (197U)—

Solution: about 0.06 mg of norfloxacin per mL.

Diluent: 0.1 N hydrochloric acid.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Sterility Tests (71): meets the requirements.

pH (791): between 5.0 and 5.4.

Assay—

Dilute phosphoric acid solution—Prepare a solution of phosphoric acid in water (1 in 1000).

Mobile phase—Prepare a filtered and degassed mixture of *Dilute phosphoric acid solution* and acetonitrile (850:150). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Prepare a solution of USP Norfloxacin RS in *Dilute phosphoric acid solution* having a known concentration of about 0.06 mg per mL.

Resolution solution—Prepare a solution of USP Norfloxacin RS and pipemidic acid in *Dilute phosphoric acid solution* having known concentrations of about 0.06 mg of each per mL.

Assay preparation—Dilute an accurately measured volume of Ophthalmic Solution quantitatively and stepwise with *Dilute phosphoric acid solution* to obtain a solution having a concentration of about 0.06 mg of norfloxacin per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The column temperature is maintained at 50°. The flow rate is about 0.5 mL per minute. Precondition the column for about 8 hours with 0.01 M monobasic sodium phosphate buffer adjusted with phosphoric acid to a pH of 4.0. Chromatograph the *Resolution solution*, and record the peak re-

sponses as directed for *Procedure*: the relative retention times are about 0.8 for pipemidic acid and 1.0 for norfloxacin; and the resolution, *R*, between the pipemidic acid peak and the norfloxacin peak is not less than 1.2. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the norfloxacin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of norfloxacin ($C_{16}H_{18}FN_3O_3$) in each mL of the Ophthalmic Solution taken by the formula:

$$(L/D)(C)(r_u/r_s)$$

in which *L* is the labeled quantity, in mg per mL, of norfloxacin in the Ophthalmic Solution; *D* is the concentration, in mg per mL, of norfloxacin in the *Assay preparation*, based on the labeled quantity of norfloxacin in each mL of the Ophthalmic Solution and the extent of dilution; *C* is the concentration, in mg per mL, of USP Norfloxacin RS in the *Standard preparation*; and *r_u* and *r_s* are the norfloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Norfloxacin Tablets

» Norfloxacin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Norfloxacin RS

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

B: Shake a quantity of finely powdered Tablets, equivalent to about 75 mg of norfloxacin, with 50 mL of a mixture of acidic methanol (prepared by mixing 1000 mL of methanol and 9 mL of hydrochloric acid) and methylene chloride (1:1). Centrifuge a portion of the suspension thus obtained, and use the clear supernatant as the test solution. Apply 50 µL each of the test solution and a standard solution of USP Norfloxacin RS in the same solvent containing 1.5 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in a suitable chromatographic chamber that contains and has been equilibrated with a developing system consisting of a mixture of chloroform, methanol, toluene, diethylamine, and water (40:40:20:14:8), and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the *R_f* value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

Dissolution (711)—

pH 4.0 buffer—To 900 mL of water in a 1000-mL volumetric flask add 2.86 mL of glacial acetic acid and 1.0 mL of a 50% (w/w) solution of sodium hydroxide, dilute with

water to volume, and mix. If necessary, adjust with glacial acetic acid or the sodium hydroxide solution to a pH of 4.0.

Medium: pH 4.0 buffer; 750 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{16}H_{18}FN_3O_3$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 278 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Norfloxacin RS in the same medium.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{16}H_{18}FN_3O_3$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of phosphoric acid solution (1 in 1000) and acetonitrile (850:150). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Norfloxacin RS quantitatively in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of norfloxacin, to a 200-mL volumetric flask. Add 80 mL of *Mobile phase*, sonicate for 10 minutes, dilute with phosphoric acid solution (1 in 1000) to volume, and mix. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter through a filter having a porosity of 1 μ m or less.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 275-nm detector and a 3.9-mm \times 30-cm column that contains packing L1, and is operated at $40 \pm 1.0^\circ$.

Precondition the column with degassed 0.01 M monobasic sodium phosphate adjusted with phosphoric acid to a pH of 4.0, flowing at a rate of 0.5 mL per minute for 8 hours. For the assay, use a *Mobile phase* flow rate of about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*; the capacity factor, k' , is not less than 2, the column efficiency is not less than 1500 theoretical plates, the tailing factor for the norfloxacin peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the quantity, in mg, of $C_{16}H_{18}FN_3O_3$ in the portion of Tablets taken by the formula:

$$500C(r_u/r_s)$$

in which C is the concentration, in mg per mL, of USP Norfloxacin RS in the *Standard preparation*, and r_u and r_s are the norfloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Norgestimate

$C_{23}H_{31}NO_3$ 369.50
18,19-Dinor-17-pregn-4-en-20-yn-3-one, 17-(acetyloxy)-13-ethyl-, oxime, (17 α)-(+)-;
(+)-13-Ethyl-17-hydroxy-18,19-dinor-17 α -pregn-4-en-20-yn-3-one oxime acetate (ester) [35189-28-7].

DEFINITION

Norgestimate is a mixture of (E)- and (Z)-isomers having a ratio of (E)- to (Z)-isomer between 1.27 and 1.78, and it contains NLT 98.0% and NMT 102.0% of norgestimate ($C_{23}H_{31}NO_3$), calculated on the dried basis.

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

Sample: Use a dispersion prepared by mixing with potassium bromide in a 1-to-100 ratio.

Acceptance criteria: Meets the requirements

- B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

DILUENT

Diluent: Methanol and water (4:1)

Mobile phase: Tetrahydrofuran, acetonitrile, and water (22:18:60)

Standard solution: 0.5 mg/mL of USP Norgestimate RS in *Diluent*

Sensitivity solution: 0.05 μ g/mL of USP Norgestimate RS in *Diluent*, from the *Standard solution*

Sample solution: 0.5 mg/mL of Norgestimate in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 244 nm

Column: 4.6-mm \times 10-cm; 3- μ m packing L1

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 25 μ L

System suitability

Samples: *Standard solution* and *Sensitivity solution*
[NOTE—The relative retention times for (Z)-norgestimate and (E)-norgestimate are about 0.86 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between (Z)-norgestimate and (E)-norgestimate, *Standard solution*

Tailing factor: NMT 1.5 for (E)-norgestimate and for (Z)-norgestimate, *Standard solution*

Relative standard deviation: NMT 2.0% for the peak area ratio of (E)-norgestimate to (Z)-norgestimate, *Standard solution*

Signal-to-noise ratio: NLT 3.0 for (Z)-norgestimate, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of norgestimate ($C_{23}H_{31}NO_3$) in the portion of Norgestimate taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = sum of the peak areas of (Z)-norgestimate and (E)-norgestimate from the *Sample solution*

- r_s = sum of the peak areas of (Z)-norgestimate and (E)-norgestimate from the *Standard solution*
 C_s = concentration of USP Norgestimate RS in the *Standard solution* (mg/mL)
 C_u = concentration of Norgestimate in the *Sample solution* (mg/mL)
 Calculate the percentages of the (Z)- and (E)-isomers, U_z and U_e , respectively, in the portion of Norgestimate taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times 100$$

- r_u = peak response of the appropriate norgestimate isomer from the *Sample solution*
 r_s = peak response of the appropriate norgestimate isomer from the *Standard solution*
 C_s = concentration of USP Norgestimate RS in the *Standard solution* (mg/mL)
 C_u = concentration of Norgestimate in the *Sample solution* (mg/mL)
 P = fraction of (E)- or (Z)-norgestimate in USP Norgestimate RS
 Calculate the ratio of U_e to U_z .
Acceptance criteria: 98.0%–102.0% of norgestimate ($C_{23}H_{31}NO_3$) on the dried basis; the ratio of (E)- to (Z)-isomer is 1.27–1.78.

[NOTE—The retention time of isobutyl alcohol in the *Internal standard solution* is 4–5 min.]

Suitability requirements

There are no interfering peaks due to dimethylformamide.

Relative standard deviation: NMT 3.0%, determined from the peak response ratio of each solvent to the internal standard, *Standard solution*

Signal-to-noise ratio: NLT 2.0 for alcohol, *System suitability solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each solvent in the portion of Norgestimate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/W) \times D \times V \times 100$$

R_U = peak response ratio of the relevant analyte to the internal standard from the *Sample solution*

R_S = peak response ratio of the relevant analyte to the internal standard from the *Standard solution*

C_S = concentration of each solvent in the *Standard solution* (mL/mL)

W = weight of Norgestimate used to prepare the *Sample solution* (mg)

D = density of each solvent (mg/mL)

V = volume of *Internal standard solution* used to prepare the *Sample solution* (mL)

Acceptance criteria

Option 1: NMT 0.5% each of acetone and alcohol is found, NMT 0.05% of diisopropyl ether is found, NMT 0.006% of chloroform is found, and NMT 0.3% of methanol is found.

Option 2: Meets the requirements in *Residual Solvents* (467)

SPECIFIC TESTS

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: 10 mg/mL in chloroform

Acceptance criteria: +40° to +46°

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Deacetylnorgestimate RS

Mixture of (*E*)- and (*Z*)-17-deacetylnorgestimate.

$C_{21}H_{29}NO_2$ 327.46

USP Norgestimate RS

USP Norgestimate Related Compound A RS

Levonorgestrel acetate.

$C_{23}H_{30}O_3$ 354.48

Norgestimate and Ethinyl Estradiol Tablets

DEFINITION

Norgestimate and Ethinyl Estradiol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of norgestimate ($C_{23}H_{31}NO_3$) and ethinyl estradiol ($C_{20}H_{24}O_2$).

IDENTIFICATION

• **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Mobile phase: Tetrahydrofuran, methanol, and water (5:2:13)

Internal standard solution: 0.05 mg/mL of dibutyl phthalate in methanol

Standard solution: Dissolve appropriate quantities of USP Ethinyl Estradiol RS and USP Norgestimate RS in a volume of *Internal standard solution* equivalent to 80% of the final volume. Add a volume of water equivalent to 20% of the final volume, and mix to obtain a solution having a known concentration of about 7 µg/mL of ethinyl estradiol and a known concentration of norgestimate similar to that expected in the *Sample solution*. Pass through a suitable filter of 0.45-µm pore size.

Sample solution: Add a number of Tablets, equivalent to 0.35 mg of ethinyl estradiol, to a suitable glass container. Add 10 mL of water, and mix with a vortex mixer until the Tablets are completely disintegrated. Add 40 mL of *Internal standard solution*, and mix with a vortex mixer for at least 23 min. Sonicate the sample for at least 5 min, pass an aliquot through a suitable filter of 0.45-µm pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 5-cm; 5-µm packing L1

Flow rate: 2.1 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethinyl estradiol, (Z)-norgestimate, (E)-norgestimate, and dibutyl phthalate are about 0.5, 1.0, 1.2, and 1.5, respectively.]

Suitability requirements

Resolution: NLT 1.5 between (Z)-norgestimate and (E)-norgestimate

Relative standard deviation: NMT 2.0% for the peak response ratio of ethinyl estradiol, (Z)-norgestimate, and (E)-norgestimate to dibutyl phthalate

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ethinyl estradiol (C₂₀H₂₄O₂) in the portion of Tablets taken:

$$\text{Result} = (R_{UE}/R_{SE}) \times (C_{SE}/C_{UE}) \times 100$$

R_{UE} = ratio of the peak responses of ethinyl estradiol to dibutyl phthalate from the *Sample solution*

R_{SE} = ratio of the peak responses of ethinyl estradiol to dibutyl phthalate from the *Standard solution*

C_{SE} = concentration of USP Ethinyl Estradiol RS in the *Standard solution* (mg/mL)

C_{UE} = nominal concentration of ethinyl estradiol in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of norgestimate (C₂₃H₃₁NO₃) in the portion of Tablets taken:

$$\text{Result} = (C_{SN}/C_{UN}) \times [P_A(R_{UA}/R_{SA}) + P_S(R_{US}/R_{SS})] \times 100$$

C_{SN} = concentration of USP Norgestimate RS in the *Standard solution* (mg/mL)

C_{UN} = nominal concentration of norgestimate in the *Sample solution* (mg/mL)

P_A = fraction of (E)-norgestimate in USP Norgestimate RS

R_{UA} = ratio of the peak responses of (E)-norgestimate to dibutyl phthalate from the *Sample solution*

R_{SA} = ratio of the peak responses of (E)-norgestimate to dibutyl phthalate from the *Standard solution*

P_S = fraction of (Z)-norgestimate in the USP Norgestimate RS

R_{US} = ratio of the peak responses of (Z)-norgestimate to dibutyl phthalate from the *Sample solution*

R_{SS} = ratio of the peak responses of (Z)-norgestimate to dibutyl phthalate from the *Standard solution*

Calculate the ratio of the content of (Z)-norgestimate to ethinyl estradiol in the portion of Tablets taken, for use in the test for *Organic Impurities*:

$$C_Z/C_E = [(C_{SN} \times P_S) \times (R_{US}/R_{SS})]/[C_{SE}(R_{UE}/R_{SE})]$$

The terms are as defined above.

Acceptance criteria: 90.0%–110.0% each of ethinyl estradiol and norgestimate

PERFORMANCE TESTS

• **DISINTEGRATION** (701): 15 min

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase, Standard solution, and Sample solution: Prepare as directed in the *Assay*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 254 nm

Column: 4.6-mm × 5-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethinyl estradiol, (Z)-norgestimate, and (E)-norgestimate are about 0.5, 1.0, and 1.2, respectively.]

Suitability requirements

Resolution: NLT 1.5 between (Z)-norgestimate and (E)-norgestimate

Relative standard deviation: NMT 2.0% for the (Z)-norgestimate and (E)-norgestimate peaks

Analysis

Sample: *Sample solution*

Calculate the percentage of any impurity having a relative retention time of about 0.2 or 0.4, relative to the (Z)-norgestimate peak, and detected at 254 nm in the portion of Tablets taken:

$$\text{Result} = (r_U/r_Z) \times (C_Z/C_E) \times F \times 100$$

r_U = peak response for each impurity

r_Z = peak response for (Z)-norgestimate

C_Z/C_E = ratio of (Z)-norgestimate to ethinyl estradiol, as defined in the *Assay*

F = relative response factor of these impurities, 1.54

Acceptance criteria: The sum of the impurities having relative retention times of about 0.2 and 0.4 is NMT 4.0%.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Ethinyl Estradiol RS
USP Norgestimate RS

Norgestrel

$C_{21}H_{28}O_2$ 312.45

18,19-Dinorpregn-4-en-20-yn-3-one, 13-ethyl-17-hydroxy-, (17 α)-(±)-.

(±)-13-Ethyl-17-hydroxy-18,19-dinor-17 α -pregn-4-en-20-yn-3-one [6533-00-2].

» Norgestrel contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Norgestrel RS

Identification, Infrared Absorption (17K)—If differences appear, dissolve portions of both the test specimen and the Reference Standard in ethyl acetate, evaporate the solutions on a steam bath to dryness, and repeat the test.

Melting range, Class I (741): between 205° and 212°, but the range between beginning and end of melting does not exceed 4°.

Optical rotation (781A): between −0.1° and +0.1°.

Test solution: 50 mg, previously dried, per mL, in chloroform.

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.3%.

Chromatographic purity—

Phosphomolybdic acid reagent—Add 10 g of phosphomolybdic acid to 100 mL of alcohol, and stir the mixture for not less than 30 minutes. Filter before use.

Test preparation—Prepare a solution of Norgestrel in chloroform to contain 10.0 mg per mL.

Standard solution and Standard dilutions—Prepare a solution of USP Norgestrel RS in chloroform to contain 10 mg per mL (*Standard solution*). Prepare a series of dilutions of *Standard solution* in chloroform to contain 0.20, 0.10, 0.05, 0.02, and 0.01 mg per mL (*Standard dilutions*).

Procedure—Apply 10- μ L volumes of *Standard solution*, the *Test preparation*, and each of the five *Standard dilutions* at equidistant points along a line 2.5 cm from one edge of a 20- \times 20-cm thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture and previously activated by heating at 100° for 15 minutes. Place the plate in a suitable developing chamber that contains and has been equilibrated with a mixture of 96 volumes of chloroform and 4 volumes of alcohol, seal the chamber, and allow the chromatogram to develop until the solvent front has moved 15 cm above the line of application. Remove the plate, allow the solvent to evaporate, then spray uniformly with *Phosphomolybdic acid reagent*, and heat it at 105° for 10 to 15 minutes. The lane of the *Test preparation* exhibits its principal spot at the same R_f as the principal spot of *Standard solution*. If spots other than the principal spot are observed in the lane of the *Test preparation*, estimate the concentra-

tion of each by comparison with the *Standard dilutions*. The spots from the 0.20-, 0.10-, 0.05-, 0.02-, and 0.01-mg per mL dilutions are equivalent to 2.0, 1.0, 0.5, 0.2, and 0.1% of impurities, respectively. The requirements of the test are met if the sum of the impurities in the *Test preparation* does not exceed 2.0%.

Limit of ethynyl group—Proceed as directed in the test for *Limit of ethynyl group* under *Norethindrone*. Not less than 7.81% and not more than 8.18% of ethynyl group is found.

Assay—Dissolve about 100 mg of Norgestrel, accurately weighed, in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a solution containing about 10 μ g per mL. Dissolve an accurately weighed quantity of USP Norgestrel RS in alcohol to obtain a *Standard solution* having a known concentration of about 10 μ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 241 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of $C_{21}H_{28}O_2$ in the portion of Norgestrel taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Norgestrel RS in the *Standard solution*, and A_U and A_S are the absorbances of the solution of Norgestrel and the *Standard solution*, respectively.

Norgestrel Tablets

» Norgestrel Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norgestrel ($C_{21}H_{28}O_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Norgestrel RS

Identification—Finely powder 20 Tablets, triturate the powder with 5 mL of chloroform, and allow the solids to settle. Apply 60 μ L of the extract and 60 μ L of a chloroform solution containing about 300 μ g of USP Norgestrel RS per mL at points about 3 cm from one edge of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in a developing chamber containing a mixture of chloroform and alcohol (96:4) to a depth of 2 cm, the chamber having been previously equilibrated with the solvent mixture. Remove the plate when the solvent has moved about 15 cm from the line of application, dry at room temperature, spray with a mixture of 80 volumes of sulfuric acid and 20 volumes of alcohol, and heat at 105° for several minutes: the spot from the solution under test exhibits an R_f value identical to that of the spot from the *Standard solution*, and, when viewed under long-wavelength UV light, exhibits a red fluorescence similar to that from the *Standard solution*.

Disintegration (701): 15 minutes, the use of disks being omitted.

Uniformity of dosage units (905): meet the requirements.

Assay—

Isoniazid reagent—Dissolve 0.25 g of isoniazid and 0.3 mL of hydrochloric acid in 500 mL of dehydrated alcohol.

Procedure—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 μ g of norgestrel, to a 30-mL separator containing 5 mL of water. Extract with three 5-mL portions of chloroform, shaking for about 1 minute each

time, and collecting the chloroform extracts through glass wool, previously moistened with chloroform, into a glass-stoppered test tube. Add 1 mL of dilute hydrochloric acid (1 in 12) to the remaining aqueous phase and extract with a fourth 5-mL portion of chloroform, collecting this chloroform extract as before and combining it with the previous three. To another glass-stoppered test tube transfer 20.0 mL of a solution of USP Norgestrel RS, in chloroform, having a known concentration of about 3.75 µg per mL. Evaporate the contents of both tubes in a water bath with the aid of a current of air to dryness. Add 5.0 mL of *Isoniazid reagent* to each tube, insert the stopper in each tube, and swirl occasionally for 1 hour. Concomitantly determine the absorbances of both solutions in 1-cm cells, at the wavelength of maximum absorbance at about 380 nm, using a suitable spectrophotometer, and using *Isoniazid reagent* as the blank. Calculate the quantity, in µg, of $C_{21}H_{28}O_2$ in the portion of Tablets taken by the formula:

$$20C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Norgestrel RS in the Standard solution, and A_U and A_S are the absorbances of the solutions from the Tablets and the Standard solution, respectively.

Norgestrel and Ethinyl Estradiol Tablets

» Norgestrel and Ethinyl Estradiol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of norgestrel ($C_{21}H_{28}O_2$) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ethinyl estradiol ($C_{20}H_{24}O_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Ethinyl Estradiol RS

USP Norgestrel RS

Identification—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: 0.0005% (w/v) polysorbate 80; 500 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Determine the amount of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ dissolved by employing the following method. [NOTE—Do not use plastics during the preparation of solutions.]

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution [NOTE—A volume of alcohol not exceeding 2% of the final volume of the solution may be used to aid in dissolving the USP Reference Standards.]—Dissolve an accurately weighed quantity of USP Norgestrel RS and USP Ethinyl Estradiol RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having known concentrations similar to those expected in the *Test solution*.

Test solution—Use a portion of the solution under test filtered through 0.7-µm borosilicate microfiber filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 247-nm detector

(for norgestrel analysis), and a spectrofluorometric detector (for ethinyl estradiol analysis) with an excitation wavelength of about 285 nm and an emission wavelength of 310 nm, and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for ethinyl estradiol and 1.0 for norgestrel; and the relative standard deviation for replicate injections is not more than 3.0% for the ethinyl estradiol and norgestrel peaks.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of norgestrel ($C_{21}H_{28}O_2$) and ethinyl estradiol ($C_{20}H_{24}O_2$) dissolved by the formula:

$$(500C)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution*; and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a degassed mixture of water, acetonitrile, and methanol (45:35:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Norgestrel RS and USP Ethinyl Estradiol RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 100 µg of norgestrel per mL and 10 µg of ethinyl estradiol per mL.

Assay preparation—Transfer an accurately counted number of Tablets, equivalent to about 10 mg of norgestrel, to a 200-mL volumetric flask. Add 100.0 mL of *Mobile phase*, accurately measured, sonicate for 10 minutes to disintegrate the Tablets, and shake by mechanical means for 20 minutes. Centrifuge the clear portion of the solution at about 2000 rpm for 10 minutes, and filter the clear supernatant.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for ethinyl estradiol and 1.5 for norgestrel; the resolution, R , between the two major peaks is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ethinyl estradiol ($C_{20}H_{24}O_2$) and norgestrel ($C_{21}H_{28}O_2$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard preparation*; and r_U and r_S are the peak responses for the relevant analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nortriptyline Hydrochloride

$C_{19}H_{21}N \cdot HCl$ 299.84
 1-Propanamine, 3-(10,11-dihydro-5H-dibenzo[a,d]cyclohepten-5-ylidene)-N-methyl-, hydrochloride;
 10,11-Dihydro-N-methyl-5H-dibenzo[a,d]cycloheptene- Δ^5 - γ -propylamine hydrochloride [894-71-3].

DEFINITION

Nortriptyline Hydrochloride contains NLT 97.0% and NMT 101.5% of nortriptyline hydrochloride ($C_{19}H_{21}N \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (17K)**
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements when tested as specified for alkaloidal hydrochlorides

ASSAY

PROCEDURE

Solution A: Phosphoric acid and water (1:10)

Buffer: Dissolve 1.4 g of dibasic sodium phosphate in 1 L of water, and adjust with *Solution A* to a pH of 7.7.

Mobile phase: Methanol and *Buffer* (70:30)

Standard solution: 0.2 mg/mL of USP Nortriptyline Hydrochloride RS in *Mobile phase*

Sample solution: 0.2 mg/mL of Nortriptyline Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

Run time: 1.3 times the retention time of nortriptyline

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nortriptyline hydrochloride

($C_{19}H_{21}N \cdot HCl$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Nortriptyline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Nortriptyline Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–101.5% on the dried basis

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** (11)

USP Amitriptyline Related Compound B RS

5-[3-(Dimethylamino)propyl]-10,11-dihydro-5H-dibenzo[a,d]-cyclohepten-5-ol.

C₂₀H₂₅NO 295.42

USP Cyclobenzaprine Related Compound B RS

3-(5H-Dibenzo[a,d]cyclohepten-5-ylidene)-N-methyl-1-propanamine hydrochloride.

C₁₉H₁₉N · HCl 297.81

USP Nortriptyline Hydrochloride RS

Nortriptyline Hydrochloride Capsules

» Nortriptyline Hydrochloride Capsules contain nortriptyline hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nortriptyline (C₁₉H₂₁N).

Packaging and storage—Preserve in tight containers.**USP Reference standards** (11)—

USP Nortriptyline Hydrochloride RS

Identification—

A: Transfer the contents of Capsules, equivalent to about 50 mg of nortriptyline hydrochloride, to a suitable flask. Add 15 mL of chloroform, insert the stopper in the flask, and shake for 15 minutes. Transfer the mixture to a suitable centrifuge tube, and centrifuge at about 2900 rpm for about 5 minutes. Pass through a suitable filter paper containing a small amount of anhydrous sodium sulfate. Evaporate the filtrate to dryness, and dissolve the residue in 0.5 mL of chloroform: the IR absorption spectrum of this solution exhibits maxima only at the same wavelengths as that of a Standard solution prepared by dissolving 50 mg of USP Nortriptyline Hydrochloride RS in 0.5 mL of chloroform.

B: A filtered solution in water of the contents of Capsules, equivalent to nortriptyline hydrochloride solution (1 in 20), responds to the tests for *Chloride* (191), when tested as specified for alkaloidal hydrochlorides.

Dissolution (711)—

Medium: water; 500 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of C₁₉H₂₁N dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

Tolerances—Not less than 80% (Q) of the labeled amount of C₁₉H₂₁N is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Phosphate buffer—Dissolve 1.63 g of monobasic potassium phosphate in 1 L of water, and adjust with 1 N potassium hydroxide to a pH of 6.7.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and *Phosphate buffer* (40:43:17). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Nortriptyline Hydrochloride RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.38 mg per mL.

Assay preparation—Weigh, empty, and combine the contents of not less than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 76 mg of nortriptyline hydrochloride, to a 200-mL volumetric flask, and dissolve in about 150 mL of methanol. Shake by mechanical means for 15 minutes, dilute with methanol to volume, mix, and filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency is not less than 500 theoretical plates, the tailing factor is not more than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of nortriptyline (C₁₉H₂₁N) in the portion of Capsules taken by the formula:

$$(263.38 / 299.84)(200C)(r_U / r_S)$$

in which 263.38 and 299.84 are the molecular weights of nortriptyline and nortriptyline hydrochloride, respectively; C is the concentration, in mg per mL, of USP Nortriptyline Hydrochloride RS in the *Standard preparation*; and *r_U* and *r_S* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Nortriptyline Hydrochloride Oral Solution

» Nortriptyline Hydrochloride Oral Solution contains nortriptyline hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of nortriptyline (C₁₉H₂₁N).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nortriptyline Hydrochloride RS

Identification—

A: Transfer a measured volume of Oral Solution, equivalent to about 50 mg of nortriptyline hydrochloride, to a suitable separator, and render the solution distinctly alkaline (to a pH of 11 or above as indicated by pH indicator paper) by the dropwise addition of 1 N sodium hydroxide. Extract with 15 mL of chloroform, and filter the chloroform extract through about 2 g of anhydrous sodium sulfate that has been previously washed with chloroform. Evaporate the chloroform extract with the aid of heat and a current of air to dryness, and dissolve the residue in 0.5 mL of chloroform: the IR absorption spectrum of this solution exhibits maxima only at the same wavelengths as that of a Standard solution obtained by dissolving 50 mg of USP Nortriptyline Hydrochloride RS in 25 mL of water and proceeding as directed for the test specimen.

B: It responds to the tests for *Chloride* (191), when tested as specified for alkaloidal hydrochlorides.

Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

pH (791): between 2.5 and 4.0.

Alcohol Determination, Method II (611): between 3.0% and 5.0% of C_2H_5OH .

Assay—Transfer an accurately measured volume of Oral Solution, equivalent to about 10 mg of nortriptyline, to a 125-mL separator. Add 20 mL of water, mix, and render the solution distinctly alkaline (to a pH of 11 or above as indicated by pH indicator paper) by the dropwise addition of sodium hydroxide solution (1 in 2). Extract the nortriptyline with four 25-mL portions of chloroform, filtering each extract into a 250-mL beaker through about 12 g of anhydrous sodium sulfate previously washed with 25 mL of chloroform. Rinse the sodium sulfate with four 5-mL portions of chloroform, and collect the rinsings in the beaker. Evaporate the combined chloroform solution with the aid of heat and a current of air to about 10 mL. Transfer the contents of the beaker with the aid of chloroform to a 200-mL volumetric flask. Evaporate the chloroform with the aid of air alone to dryness. [Caution—Do not use heat.] Dissolve the residue in 1.7 mL of hydrochloric acid, dilute with water to volume, and mix. Transfer 10.0 mL of the solution to a 50-mL volumetric flask, dilute with water to volume, and mix to obtain the *Assay preparation*. Concomitantly determine the absorbances of the *Assay preparation* and a Standard solution of USP Nortriptyline Hydrochloride RS in water having a known concentration of about 11.4 μ g per mL in 1-cm cells at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_{19}H_{21}N$ in the portion of Oral Solution taken by the formula:

$$(263.38/299.84)(C)(A_U / A_S)$$

in which 263.38 and 299.84 are the molecular weights of nortriptyline and nortriptyline hydrochloride, respectively; C is the concentration, in μ g per mL, of USP Nortriptyline Hydrochloride RS in the Standard solution; and A_U and A_S are the absorbances of the *Assay preparation* and the Standard solution, respectively.

Noscapine

$C_{22}H_{23}NO_7$ 413.42

1(3*H*)-Isobenzofuranone, 6,7-dimethoxy-3-(5,6,7,8-tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl), [*S*-(*R**,*S**)]-;

Narcotine [128-62-1].

DEFINITION

Noscapine contains NLT 99.0% and NMT 100.5% of noscapine ($C_{22}H_{23}NO_7$), calculated on the anhydrous basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (197K):** Do not dry specimens.
- B. ULTRAVIOLET ABSORPTION (197U)**

Solution: 60 μ g/mL

Medium: Methanol

Acceptance criteria: Meets the requirements

C.

Analysis: Place about 100 mg in a small porcelain dish, add a few drops of sulfuric acid, and stir.

Acceptance criteria: A greenish yellow solution is produced, and on warming it becomes red and then turns violet.

ASSAY**PROCEDURE**

Sample solution: Dissolve about 1.5 g of Noscapine in 25 mL of glacial acetic acid.

Analysis: Add 25 mL of dioxane and 5 drops of crystal violet TS to the *Sample solution*, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.34 mg of noscapine ($C_{22}H_{23}NO_7$).

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES

- RESIDUE ON IGNITION (281):** NMT 0.1%
- CHLORIDE AND SULFATE, Chloride (221):** A 700-mg portion shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.02%).

LIMIT OF MORPHINE

Sample solution: Dissolve 100 mg in 10 mL of 0.1 N hydrochloric acid.

Analysis: To 1.0 mL of the *Sample solution* add 5.0 mL of diluted ferricyanide reagent (prepared by dissolving 0.50 g of potassium ferricyanide in 50 mL of water, adding 0.50 mL of ferric chloride TS, and diluting 5.0 mL of the resulting solution to 25.0 mL).

Acceptance criteria: No blue or dark green color develops within 1 min.

ORDINARY IMPURITIES (466)

Standard solution: Chloroform

Test solution: Chloroform

Eluant: Ethyl acetate and ether (80:20)

Visualization: 17; then examine the plate immediately.

Acceptance criteria: The sum of the intensities of all secondary spots of the *Test solution* corresponds to NMT 1.0%.

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 174°–176°
- **OPTICAL ROTATION**, *Specific Rotation* (781S)
Sample solution: 20 mg/mL in 0.1 N hydrochloric acid
Acceptance criteria: +42° to +48°
- **WATER DETERMINATION**, *Method I* (921): NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Noscaphine RS

Novobiocin SodiumC₃₁H₃₅N₂NaO₁₁ 634.61

Benzamide, N-[7-[[3-O-(aminocarbonyl)-6-deoxy-5-C-methyl-4-O-methyl-β-L-lyxo-hexopyranosyl]oxy]-4-hydroxy-8-methyl-2-oxo-2H-1-benzopyran-3-yl]-4-hydroxy-3-(3-methyl-2-butenyl), monosodium salt.
Novobiocin, monosodium salt [1476-53-5].

» Novobiocin Sodium has a potency equivalent to not less than 850 μg of novobiocin (C₃₁H₃₆N₂O₁₁) per mg, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Novobiocin RS

Identification—

A: Prepare a test solution by dissolving a quantity of it in methanol to obtain a concentration of about 1 mg of novobiocin per mL. Similarly prepare a Standard solution, using USP Novobiocin RS. Separately apply 1-μL portions of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow the spots to dry. Place the plate in a chromatographic chamber equilibrated with a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (75:25:1), and develop the chromatogram. When the solvent front has moved about three-fourths of the length of the plate, remove the plate from the chamber, and allow to dry. Locate the spots on the plate by examination under short-wavelength UV light: the *R_f* value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

B: The residue obtained by igniting it responds to the tests for Sodium (191).

Specific rotation (781S): between –50° and –58°.

Test solution: 50 mg per mL, in a mixture of methanol and hydrochloric acid (100:1).

Crystallinity (695): meets the requirements.

pH (791): between 6.5 and 8.5, in a solution containing 25 mg per mL.

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.

Residue on ignition (281): between 10.5% and 12.0%, the charred residue being moistened with 2 mL of sulfuric acid and an ignition temperature of 550 ± 50° being used.

Change to read:

Assay—Dissolve a suitable quantity of Novobiocin Sodium, accurately weighed, in an accurately measured volume of

• **Buffer B.3** (CN 1-May-2017) sufficient to obtain a stock solution of convenient concentration. Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively and stepwise with • **Buffer B.6** (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Novobiocin Sodium Intramammary Infusion

» Novobiocin Sodium Intramammary Infusion is a suspension of Novobiocin Sodium in a suitable vegetable oil vehicle. It contains suitable preservative and suspending agents. It contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of novobiocin (C₃₁H₃₆N₂O₁₁).

Packaging and storage—Preserve in disposable syringes that are well-closed containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Novobiocin RS

Water Determination, *Method I* (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Change to read:

Assay—Proceed as directed for novobiocin under *Antibiotics—Microbial Assays* (81), expelling the contents of a syringe of Intramammary Infusion into a high-speed blender jar containing 1.0 mL of polysorbate 80 and 499.0 mL of • **Buffer B.3** (CN 1-May-2017), and blend for 3 to 5 minutes. Allow to stand for 10 minutes, and dilute quantitatively and stepwise with • **Buffer B.6** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of novobiocin assumed to be equal to the median dose level of the Standard.

NystatinC₄₇H₇₅NO₁₇

Nystatin A;

14,39-Dioxabicyclo[33.3.1]nonatriaconta-19,21,25,27,29,31-hexaene-36-carboxylic acid, 33-[(3-amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,4,7,9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-, (1S,3R,4R,7R,9R,11R,15S,16R,17R,18S,19E,21E,25E,27E,29E,31E,33R,35S,36R,37S)-; (1S,3R,4R,7R,9R,11R,15S,16R,17R,18S,19E,21E,25E,27E,29E,31E,33R,35S,36R,37S)-33-[(3-Amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,4,7,9,11,17,37-octahydroxy-15,16,

18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nona-triaconta-19,21,25,27,29,31-hexaene-36-carboxylic acid [1400-61-9].

DEFINITION

Nystatin is a substance or a mixture of two or more substances produced by the growth of *Streptomyces noursei* Brown et al. (Fam. Streptomycetaceae). It has a potency of NLT 4400 USP Nystatin Units/mg or, where intended for use in the extemporaneous preparation of oral suspensions, NLT 5000 USP Nystatin Units/mg.

IDENTIFICATION

• A. ULTRAVIOLET ABSORPTION (197U)

Sample stock solution: Transfer a suitable quantity of Nystatin to a suitable glass-stoppered volumetric flask, add methanol and glacial acetic acid, using 25% and 5% of the final volumes respectively, mix to dissolve, dilute with methanol to volume, and mix.

Sample solution: 10 µg/mL of Nystatin from the *Sample stock solution* in methanol

Acceptance criteria: $A_{230}/A_{279(sh)}$, 0.90–1.25

ASSAY

• PROCEDURE

(See *Antibiotics—Microbial Assays* (81).)

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NLT 4400 USP Nystatin Units/mg; where intended for use in the extemporaneous preparation of oral suspensions, NLT 5000 USP Nystatin Units/mg

SPECIFIC TESTS

• SUSPENDABILITY (where packaged for use in the extemporaneous preparation of oral suspensions)

Analysis

1. Transfer about 200 mg, accurately weighed, to a 250-mL beaker containing 200.0 mL of water, and disperse by stirring gently with a stirring rod. Allow to stand for 2 min, and observe the suspension.
2. If there is any sediment, assay the undisturbed suspension as directed for Nystatin in *Antibiotics—Microbial Assays* (81), using a suitable aliquot blended in a high-speed blender for 3–5 min with a sufficient volume of dimethylformamide to obtain a solution having a concentration of 400 USP Nystatin Units/mL. Dilute this stock solution quantitatively with *Buffer B*, 6 to obtain a *Test Dilution* having a nystatin concentration assumed to be equal to the median level of the standard.

Acceptance criteria

1. The material is in suspension, and little or no sediment is present on the bottom of the beaker.
2. If there is any sediment, the undisturbed suspension contains NLT 90.0% of the expected number of USP Nystatin Units, based on the potency obtained in the Assay.

• CRYSTALLINITY (695) (where packaged for use in the extemporaneous preparation of oral suspensions):

Meets the requirements

• pH (791)

Sample suspension: 3% aqueous

Acceptance criteria: 6.0–8.0

• LOSS ON DRYING (731)

Sample: 100 mg

Analysis: Dry the *Sample* in a capillary-stoppered bottle under vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h.

Acceptance criteria: NMT 5.0%

• COMPOSITION

Solution A: Acetonitrile and 0.05 M ammonium acetate (29:71)

Solution B: Acetonitrile and 0.05 M ammonium acetate (60:40)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
25	100	0
35	0	100
40	0	100
45	100	0
50	100	0

System suitability solution: Dissolve 20 mg of Nystatin in 25 mL of methanol, and dilute with water to 50 mL. To 10.0 mL of the resulting solution add 2.0 mL of dilute hydrochloric acid, and allow to stand at room temperature for 1 h.

Standard solution: 0.4 mg/mL of USP Nystatin RS in dimethyl sulfoxide. Protect this solution from light, store refrigerated, and use within 24 h.

Sample solution: 0.4 mg/mL of Nystatin in dimethyl sulfoxide. Protect this solution from light, store refrigerated, and use within 24 h.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 304 nm

Column: 4.6-mm × 15-cm; base-deactivated, end-capped 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The nystatin A1 peak elutes at 14 min. Identify this peak using the *Standard solution*.]

Suitability requirements

Resolution: NLT 3.5 between the two major peaks, *System suitability solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each peak:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = area of each individual peak

r_T = total area of all peaks except those eluting in less than 2 min

Acceptance criteria: NLT 85.0% of nystatin A1; NMT 4.0% of any other individual component. Disregard any peaks eluting in less than 2 min.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight, light-resistant containers.

• LABELING:

Where packaged for use in the extemporaneous preparation of oral suspensions, the label so states.

• USP REFERENCE STANDARDS (11)

USP Nystatin RS

Nystatin Cream

DEFINITION

Nystatin Cream contains NLT 90.0% and NMT 130.0% of the labeled amount of USP Nystatin Units.

ASSAY**• PROCEDURE**

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: 400 USP Nystatin Units/mL prepared as follows. Blend a suitable portion of Cream in a high-speed blender for 3–5 min with a suitable volume of dimethylformamide.

Analysis: Proceed as directed in the chapter. Dilute an aliquot of the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a nystatin concentration assumed to be equal to the median level of the standard.

Acceptance criteria: 90.0%–130.0% of the labeled amount of USP Nystatin Units

PERFORMANCE TESTS

- MINIMUM FILL (755):** Meets the requirements

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in collapsible tubes, or in other tight containers, and avoid exposure to excessive heat.
- USP REFERENCE STANDARDS (11)**
USP Nystatin RS

Nystatin Lotion

» Nystatin Lotion contains not less than 90.0 percent and not more than 140.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in tight containers, at controlled room temperature.

USP Reference standards (11)—

USP Nystatin RS

pH (791): between 5.5 and 7.5.

Assay—Proceed with Lotion as directed in the Assay under *Nystatin Cream*.

Nystatin Lozenges

» Nystatin Lozenges contain not less than 90.0 percent and not more than 125.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nystatin RS

Disintegration (701): 90 minutes, determined as set forth under *Uncoated Tablets*.

pH (791): between 5.0 and 7.5, in a solution prepared by dissolving 1 Lozenge in 100 mL of water at 37° and allowing the solution to cool to room temperature.

Change to read:

Assay—Proceed as directed for Nystatin under *Antibiotics—Microbial Assays* (81), blending not less than 5 Lozenges for 18 to 20 minutes in a high-speed blender jar containing 100.0 mL of water. Add 400.0 mL of dimethylformamide, and blend for an additional 10 minutes. Dilute an accurately measured volume of this solution quantitatively with a mixture of dimethylformamide and water (4:1) to obtain a stock solution containing about 400 USP Nystatin Units per

mL. Dilute an accurately measured volume of this stock solution quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a nystatin concentration assumed to be equal to the median dose level of the Standard. [NOTE—The *Test Dilution* of the specimen and the test dilutions of the Standard contain the same amount of dimethylformamide (about 4%).]

Nystatin Ointment

» Nystatin Ointment contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in well-closed containers, preferably at controlled room temperature.

USP Reference standards (11)—

USP Nystatin RS

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay—Proceed with Ointment as directed in the Assay under *Nystatin Cream*.

Nystatin Topical Powder

» Nystatin Topical Powder is a dry powder composed of Nystatin and Talc. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Nystatin RS

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

Assay—Proceed with Topical Powder as directed in the Assay under *Nystatin Cream*.

Nystatin Vaginal Suppositories

» Nystatin Vaginal Suppositories contain not less than 90.0 percent and not more than 130.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in tight, light-resistant containers, at controlled room temperature.

USP Reference standards (11)—

USP Nystatin RS

Water Determination, Method I (921): not more than 1.5%.

Assay—Proceed with Vaginal Suppositories as directed in the Assay under *Nystatin Tablets*.

Nystatin Oral Suspension

» Nystatin Oral Suspension contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of USP Nystatin Units. It contains suitable dispersants, flavors, preservatives, and suspending agents.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nystatin RS

Uniformity of dosage units (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Procedure for content uniformity—[NOTE—Use low-actinic glassware.] Transfer the well-shaken contents of 1 container of Oral Suspension to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Dilute an accurately measured volume of this solution quantitatively, and stepwise if necessary, with methanol to obtain a test solution containing about 25 USP Nystatin Units per mL. Similarly, prepare a Standard solution of USP Nystatin RS in methanol having a known concentration of about 25 USP Nystatin Units per mL. Concomitantly determine the absorbances of the test solution and the Standard solution at the wavelength of maximum absorbance at about 304 nm with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in USP Nystatin Units, in the container taken by the formula:

$$(CL/D)(A_U / A_S)$$

in which C is the concentration, in USP Nystatin Units per mL, of the Standard solution; L is the labeled quantity, in USP Nystatin Units, in the container; D is the concentration, in USP Nystatin Units, in the test solution, on the basis of the labeled quantity in the container and the extent of dilution; and A_U and A_S are the absorbances of the test solution and the Standard solution, respectively.

Deliverable volume (698): meets the requirements.

pH (791): between 4.5 and 6.0; or if it contains glycerin, between 5.3 and 7.5.

Change to read:

Assay—Proceed as directed for Nystatin under *Antibiotics—Microbial Assays* (81), blending a suitable accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, for 3 to 5 minutes in a high-speed blender with a sufficient accurately measured volume of dimethylformamide to obtain a solution of convenient concentration. Dilute an accurately measured portion of this solution quantitatively with dimethylformamide to obtain a stock solution containing about 400 USP Nystatin Units per mL. Dilute this stock solution quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Nystatin for Oral Suspension

DEFINITION

Nystatin for Oral Suspension is a dry mixture of Nystatin with one or more suitable colors, diluents, suspending agents, flavors, and preservatives. It contains the equivalent of NLT 90.0% and NMT 140.0% of the labeled amount of USP Nystatin Units.

ASSAY

• PROCEDURE

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: 400 USP Nystatin Units/mL prepared as follows. Constitute Nystatin for Oral Suspension as directed in the labeling. Blend a suitable aliquot of the suspension, freshly mixed and free from air bubbles, for 3–5 min in a high-speed blender with a sufficient volume of dimethylformamide to obtain a solution of suitable concentration. Dilute a portion of the resulting solution with dimethylformamide.

Analysis: Proceed as directed in the chapter. Dilute an aliquot of the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a nystatin concentration assumed to be equal to the median level of the standard.

Acceptance criteria: 90.0%–140.0% of the labeled amount of USP Nystatin Units

PERFORMANCE TESTS

• UNIFORMITY OF DOSAGE UNITS (905)

For powder packaged in single-unit containers

Acceptance criteria: Meets the requirements

• DELIVERABLE VOLUME (698)

For powder packaged in multiple-unit containers

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

• pH (791)

Sample suspension: Constitute as directed in the labeling.

Acceptance criteria: 4.9–5.5

• WATER DETERMINATION, Method I (921): NMT 7.0%

ADDITIONAL REQUIREMENTS

• **USP REFERENCE STANDARDS (11)**

USP Nystatin RS

Nystatin Tablets

DEFINITION

Nystatin Tablets contain NLT 90.0% and NMT 130.0% of the labeled amount of USP Nystatin Units.

ASSAY

• PROCEDURE

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: 400 USP Nystatin Units/mL prepared as follows. Blend NLT 5 Tablets for 3–5 min in a high-speed blender with a sufficient volume of dimethylformamide to obtain a solution of suitable concentration. Dilute a portion of this solution with dimethylformamide.

Analysis: Proceed as directed in the chapter. Dilute an aliquot of the *Sample solution* with *Buffer B.6* to obtain a *Test Dilution* having a nystatin concentration assumed to be equal to the median level of the standard.

Acceptance criteria: 90.0%–130.0% of the labeled amount of USP Nystatin Units

PERFORMANCE TESTS

• DISINTEGRATION (701)

Time: If plain-coated, 120 min

Acceptance criteria: Meet the requirements

SPECIFIC TESTS

• LOSS ON DRYING (731)

Sample: 100 mg of powdered Tablets

Analysis: Dry the *Sample* in a capillary-stoppered bottle under vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h.

Acceptance criteria: If plain-coated, NMT 5.0%; if film-coated, NMT 8.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label the Tablets to indicate that they are intended for oral use only (as distinguished from Vaginal Tablets).
- **USP REFERENCE STANDARDS (11)**
USP Nystatin RS

Nystatin Vaginal Inserts**DEFINITION**

Nystatin Vaginal Inserts are composed of Nystatin with suitable binders, diluents, and lubricants. Vaginal Inserts contain NLT 90.0% and NMT 140.0% of the labeled amount of USP Nystatin Units.

ASSAY**Change to read:**• **NYSTATIN**

(See *Antibiotics—Microbial Assays* (81).)

Sample stock solution: 400 USP Nystatin Units/mL in dimethylformamide prepared as follows. Blend NLT 5 Vaginal Inserts for 3–5 min in a high-speed blender with a sufficient volume of dimethylformamide to obtain a solution of suitable concentration. Dilute a portion of this solution with dimethylformamide.

Test dilution: Dilute a volume of the *Sample stock solution* with *Buffer B.6* (CN 1-May-2017) to obtain a nystatin concentration assumed to be equal to the median dose level of the standard.

Acceptance criteria: 90.0%–140.0% of the labeled amount of USP Nystatin Units

PERFORMANCE TESTS• **DISINTEGRATION (701)**

Time: 60 min

Analysis: Use the *Procedure for Uncoated Tablets* in the chapter.

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- **LOSS ON DRYING (731):** Dry 100 mg of powdered Vaginal Inserts in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers and, where so specified in the labeling, in a refrigerator.
- **USP REFERENCE STANDARDS (11)**
USP Nystatin RS

Nystatin, Neomycin Sulfate, Gramicidin, and Triamcinolone Acetonide Cream

» Nystatin, Neomycin Sulfate, Gramicidin, and Triamcinolone Acetonide Cream contains not less than 90.0 percent and not more than 140.0 percent of the labeled amounts of nystatin, neomycin, and gramicidin, and not less than 90.0 percent and not more than 110.0 percent of the

labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Gramicidin RS

USP Neomycin Sulfate RS

USP Nystatin RS

USP Triamcinolone Acetonide RS

Identification—Place 2 g of Cream in a conical flask, add 5.0 mL of chloroform, and shake for 10 minutes. Add 15 mL of alcohol, and shake for an additional 10 minutes. Filter the solution into a centrifuge tube, and evaporate the filtrate to dryness. Dissolve the residue in alcohol to obtain a solution containing about 250 µg of triamcinolone acetonide per mL. Proceed as directed in the *Identification* test under *Triamcinolone Acetonide Cream*, beginning with "Apply 10 µL of this solution": the specified result is observed.

Minimum fill (755): meets the requirements.

Change to read:

Assay for nystatin—Proceed as directed for nystatin under *Antibiotics—Microbial Assays* (81), blending a suitable, accurately weighed portion of Cream in a high-speed blender for 3 to 5 minutes with a sufficient, accurately measured volume of dimethylformamide to give a convenient concentration. Dilute an accurately measured volume of the solution so obtained quantitatively with dimethylformamide to obtain a stock solution containing about 400 USP Nystatin Units per mL. Dilute an accurately measured volume of this stock solution quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of nystatin assumed to be equal to the median dose level of the Standard.

Assay for neomycin—Proceed with Cream as directed in the *Assay* under *Neomycin Sulfate Cream*.

Assay for gramicidin—Proceed as directed for gramicidin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Cream dissolved in 50 mL of hexanes in a separator, and extracted with four 20-mL portions of 80% alcohol. Combine the extracts in a suitable volumetric flask, dilute with alcohol to volume, and mix. Dilute an accurately measured volume of the solution so obtained quantitatively and stepwise with alcohol to obtain a *Test Dilution* having a concentration of gramicidin assumed to be equal to the median dose level of the Standard.

Assay for triamcinolone acetonide—Proceed with Cream as directed in the *Assay* under *Triamcinolone Acetonide Cream*.

Nystatin, Neomycin Sulfate, Gramicidin, and Triamcinolone Acetonide Ointment

» Nystatin, Neomycin Sulfate, Gramicidin, and Triamcinolone Acetonide Ointment contains not less than 90.0 percent and not more than 140.0 percent of the labeled amounts of nystatin, neomycin, and gramicidin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Gramicidin RS

USP Neomycin Sulfate RS

USP Nystatin RS
USP Triamcinolone Acetonide RS

Identification—Place 2 g of Ointment in a conical flask, add 5.0 mL of chloroform, and shake for 10 minutes. Add 15 mL of alcohol, and shake for an additional 10 minutes. Filter the solution into a centrifuge tube, and evaporate the filtrate to dryness. Dissolve the residue in alcohol to obtain a solution containing about 250 µg of triamcinolone acetonide per mL. Proceed as directed in the *Identification* test under *Triamcinolone Acetonide Cream*, beginning with "Apply 10 µL of this solution": the specified result is observed.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Change to read:

Assay for nystatin—Proceed as directed for nystatin under *Antibiotics—Microbial Assays* (81), blending a suitable, accurately weighed portion of Ointment in a high-speed blender for 3 to 5 minutes with a sufficient, accurately measured volume of dimethylformamide to give a convenient concentration. Dilute an accurately measured volume of the solution so obtained quantitatively with dimethylformamide to obtain a stock solution containing about 400 USP Nystatin Units per mL. Dilute an accurately measured volume of this stock solution quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of nystatin assumed to be equal to the median dose level of the Standard.

Assay for neomycin—Proceed with Ointment as directed in the *Assay under Neomycin Sulfate Ointment*.

Assay for gramicidin—Proceed as directed for gramicidin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment dissolved in 50 mL of hexanes in a separator, and extracted with four 20-mL portions of 80% alcohol. Combine the extracts in a suitable volumetric flask, dilute with alcohol to volume, and mix. Dilute an accurately measured volume of the solution so obtained quantitatively and stepwise with alcohol to obtain a *Test Dilution* having a concentration of gramicidin assumed to be equal to the median dose level of the Standard.

Assay for triamcinolone acetonide—Proceed with Ointment as directed in the *Assay under Triamcinolone Acetonide Cream*, except to read "Ointment" in place of "Cream" throughout.

Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Cream

» Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Cream contains not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of nystatin, neomycin, and thiostrepton, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

Assay for neomycin—Proceed as directed for the turbidimetric assay for neomycin under *Antibiotics—Microbial Assays* (81), placing an accurately weighed portion of Cream, equivalent to about 2.5 mg of neomycin, in a 250-mL conical flask, and treating it as follows. Add 50 mL of 0.01 N hydrochloric acid, and shake to disperse the Cream. Transfer the mixture to a 100-mL centrifuge tube. Wash the flask with 40 mL of hexanes, with shaking, and transfer the washing to the centrifuge tube. Stopper the centrifuge tube, shake, and centrifuge for 5 minutes. Draw off the lower aqueous layer, and transfer it to a 250-mL volumetric flask. Repeat the extraction of the hexanes layer remaining in the centrifuge tube with two 50-mL portions of 0.01 N hydrochloric acid, combining the aqueous extracts in the 250-mL volumetric flask. Dilute the contents of the volumetric flask with 0.01 N hydrochloric acid to volume, and mix. Dilute this solution quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose of the Standard.

Assay for thiostrepton—Proceed as directed for thiostrepton under *Antibiotics—Microbial Assays* (81), blending a suitable, accurately weighed portion of Cream in a high-speed blender with a sufficient, accurately measured volume of dimethyl sulfoxide to give a convenient concentration, and filter. Dilute an accurately measured volume of the filtrate so obtained quantitatively with dimethyl sulfoxide to obtain a *Test Dilution* having a concentration of thiostrepton assumed to be equal to the median dose level of the Standard.

Assay for triamcinolone acetonide—Proceed with Cream as directed in the *Assay under Triamcinolone Acetonide Cream*.

Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Ointment

» Nystatin, Neomycin Sulfate, Thiostrepton, and Triamcinolone Acetonide Ointment contains not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of nystatin, neomycin, and thiostrepton, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Nystatin RS

USP Neomycin Sulfate RS

USP Thiostrepton RS

USP Triamcinolone Acetonide RS

Identification—Place 2 g of Ointment in a conical flask, add 5.0 mL of chloroform, and shake for 10 minutes. Add 15 mL of alcohol, and shake for an additional 10 minutes. Filter the solution into a centrifuge tube, and evaporate the filtrate to dryness. Dissolve the residue in alcohol to obtain a solution containing about 250 µg of triamcinolone acetonide per mL. Proceed as directed in the *Identification* test under *Triamcinolone Acetonide Cream*, beginning with "Apply 10 µL of this solution": the specified result is observed.

Minimum fill (755): meets the requirements.

Assay for nystatin—[NOTE—Protect solutions that contain nystatin from ambient light.]

Ammonium acetate buffer—Dissolve 10.8 ± 1.0 g of ammonium acetate in 2500 mL of water. Adjust with acetic acid to a pH of 6.50 ± 0.05 .

Mobile phase—Mix 2500 mL of *Ammonium acetate buffer*, 1000 mL of acetonitrile, and 500 mL of methanol. Pass through a 0.45-µm nylon filter.

BHT solution—Weigh about 1.0 g of butylated hydroxytoluene, and transfer to a 1000-mL volumetric flask. Dilute with methanol to volume, and mix.

Standard preparation—In duplicate, dissolve an accurately weighed quantity of USP Nystatin RS in *BHT solution* to obtain a solution having a known concentration of about 5400 USP Nystatin Units per mL. Store in low-actinic glassware.

System suitability solution—Weigh about 50 mg of USP Nystatin RS, and transfer to a 50-mL low-actinic volumetric flask. Add 0.5 mL of 0.01 N sodium hydroxide, and allow to sit for 1 minute. Add 5 mL of *Ammonium acetate buffer*. Add about 25 mL of methanol, and sonicate to dissolve. Dilute with methanol to volume, and store in low-actinic glassware.

Assay preparation—Thoroughly mix the Ointment prior to sampling. In duplicate, accurately weigh about 1.0 g of Ointment having a known density into a low-actinic sample bottle. Add 20.0 mL of *BHT solution*, and insert a polytetrafluoro-coated magnetic stir bar having dimensions of about 12.7×7.9 mm. Clamp the bottles onto a suitable mixer mill,¹ and mix for a minimum of 5 minutes at about 30 Hz. Centrifuge at about $1350 \times g$ for 5 minutes, or until the supernatant is clear. Transfer the supernatant to low-actinic glassware.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 304-nm detector

and a 3.9-mm \times 15-cm column that contains 4-µm packing L1. The column temperature is maintained at 40°, and the flow rate is about 2.0 mL per minute. [NOTE—Solutions containing nystatin should be stored at 8° until they can be injected into the chromatograph.] Chromatograph the *Standard preparation* and the *System suitability solution*, and record the peak areas as directed for *Procedure*: using the *System suitability solution*, the relative retention times for the nystatin A1 and nystatin A2 peaks are about 1.0 and 1.4, respectively; the column efficiency, using the nystatin A1 peak, is not less than 1200 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%. [NOTE—After the conclusion of the run, rinse the column with a mixture of acetonitrile and water (85:15) until the baseline is stable, and store in this solution. At the beginning of the next run, rinse with *Mobile phase* until the baseline is stable.]

Procedure—Separately inject equal volumes (about 15 µL) of the duplicate *Standard preparation* and *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for nystatin A1 and nystatin A2. Calculate the quantity, in USP Nystatin Units, of nystatin in the portion of Ointment taken by the formula:

$$20(C_s / W_u)(r_u / r_s)$$

in which C_s is the concentration of USP Nystatin RS, in USP Nystatin Units per mL, of the *Standard preparation*; W_u is the weight, in g, of Ointment taken to prepare the *Assay preparation*; and r_u and r_s are the average peak areas of the sum of nystatin A1 and nystatin A2 obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Octinoxate

$C_{18}H_{26}O_3$ 290.40
2-Ethylhexyl 3-(4-methoxyphenyl)-2-propenoate.
2-Propenoic acid, 3-(4-methoxyphenyl)-, 2-ethylhexyl ester.
[5466-77-3].

» Octinoxate contains not less than 95.0 percent and not more than 105.0 percent of $C_{18}H_{26}O_3$, calculated on the as-is basis.

Packaging and storage—Preserve in tight containers, in a cool place.

USP Reference standards (11)—

USP Octinoxate RS
Octyl methoxycinnamate.

Identification—

A: Infrared Absorption (197F).

B: Ultraviolet Absorption (197U)—

Solution: 5 μ g per mL.

Medium: alcohol.

Specific gravity (841): between 1.005 and 1.013.

Refractive index (831): between 1.542 and 1.548 at 20°.

Acidity—Transfer 5 mL of Octinoxate to a suitable container, add 50 mL of alcohol, and mix. Add 4 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide: not more than 0.8 mL is consumed.

Chromatographic purity—

Test solution—Transfer about 5 mL of Octinoxate to a 100-mL volumetric flask, dilute with acetone to volume, and mix.

Chromatographic system (see Chromatography (621))—Proceed as directed in the Assay.

Procedure—Inject a volume (about 1 μ L) of the Test solution into the chromatograph, record the chromatogram, and measure the areas for all the peaks. Calculate the percentage of each impurity in the portion of Octinoxate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area for each impurity; and r_s is the sum of the areas for all the peaks: not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities is found.

Assay—

Internal standard solution—Transfer about 25 mL of benzyl benzoate to a 500-mL volumetric flask, dilute with acetone to volume, and mix.

Standard preparation—Dilute an accurately measured quantity of USP Octinoxate RS quantitatively, and stepwise if necessary, with Internal standard solution to obtain a solution having a known concentration of about 50 mg per mL.

Assay preparation—Transfer about 5 mL of Octinoxate, accurately measured, to a 100-mL volumetric flask, dilute with Internal standard solution to volume, and mix.

Chromatographic system (see Chromatography (621))—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm \times 25-m column with 0.25- μ m thickness of phase G1 coating, and a split injection system with a split ratio of about 85:1. The carrier gas is helium, flowing at a rate of about 2 mL per minute. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 80°, then the temperature is increased to

300° over a period of 10 minutes, and maintained at 300° for 10 minutes. The injection port temperature is maintained at 250°, and the detector temperature is maintained at 300°. Chromatograph the Standard preparation, and record the peak areas as directed for Procedure: the relative retention times are about 0.68 for benzyl benzoate and 1.0 for octinoxate; the resolution, R , between benzyl benzoate and octinoxate is not less than 20; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 μ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{18}H_{26}O_3$ in the portion of Octinoxate taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Octinoxate RS in the Standard preparation; and R_U and R_S are the peak area ratios of octinoxate to benzyl benzoate obtained from the Assay preparation and the Standard preparation, respectively.

Octisalate

$C_{15}H_{22}O_3$ 250.33
2-Ethylhexyl salicylate.
Benzoic acid, 2-hydroxy-, 2-ethylhexyl ester [118-60-5].

» Octisalate contains not less than 95.0 percent and not more than 105.0 percent of $C_{15}H_{22}O_3$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Octisalate RS
Octyl salicylate.

Identification—

A: Infrared Absorption (197F).

B: Ultraviolet Absorption (197U)—

Solution: 5.0 μ g per mL.

Medium: alcohol.

Absorptivity at 305 nm, calculated on the as-is basis, does not differ by more than 3.0%.

Specific gravity (841): between 1.011 and 1.016.

Refractive index (831): between 1.500 and 1.503 at 20°.

Acidity—Transfer 50 mL of alcohol to a suitable container, add 1 mL of phenol red TS, and add sufficient 0.1 N sodium hydroxide to obtain a persistent pink color. Transfer 50 mL of this solution to a suitable container, add about 5.0 mL of accurately measured Octisalate, mix, and titrate with 0.1 N sodium hydroxide: not more than 0.2 mL of 0.1 N sodium hydroxide per mL of Octisalate is required for neutralization.

Chromatographic purity—

Test solution—Use the Assay preparation.

Chromatographic system—Proceed as directed in the Assay. To evaluate the system suitability requirements, use the Standard preparation, as prepared in the Assay.

Procedure—Inject a volume (about 1 μ L) of the Test solution into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Octisalate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all the peaks: not more than

0.5% of any individual impurity is found; and not more than 2.0% of total impurities is found.

Assay—

Standard preparation—Dissolve an accurately weighed quantity of USP Octisalate RS in *tert*-butyl methyl ether, and dilute quantitatively, and stepwise if necessary, with *tert*-butyl methyl ether to obtain a solution having a known concentration of about 20.0 mg per mL.

Assay preparation—Transfer about 2 g of Octisalate, accurately weighed, to a 100-mL volumetric flask, dilute with *tert*-butyl methyl ether to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 25-m column coated with a 0.1-μm film of phase G1. The carrier gas is helium, flowing at a rate of about 6 mL per minute. The split ratio is 50:1. [NOTE—Split ratio can be modified in order to optimize the performance.] The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 60°, then the temperature is increased at a rate of 8° per minute to 240°, and is maintained at 240° for 10 minutes. The injection port temperature is maintained at 240°, and the detector temperature is maintained at 260°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between octisalate and any other peak is not less than 1.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{15}H_{22}O_3$ in the portion of Octisalate taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Octisalate RS in the *Standard preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Octocrylene

$C_{24}H_{27}NO_2$ 361.48

2-Propenoic acid, 2-cyano-3,3-diphenyl, 2-ethylhexyl ester.
2-Ethylhexyl 2-cyano-3,3-diphenylacrylate [6197-30-4].

» Octocrylene contains not less than 95.0 percent and not more than 105.0 percent of $C_{24}H_{27}NO_2$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Octocrylene RS

Identification, Ultraviolet Absorption (197U)—

Solution: 25 μg per mL.

Medium: methanol.

Absorptivity at 303 nm, calculated on the as-is basis, do not differ by more than 3.0%.

Specific gravity (841): between 1.045 and 1.055.

Refractive index (831): between 1.561 and 1.571 at 20°.

Acidity—Transfer 60 mL of alcohol to a suitable container, add 1 mL of phenolphthalein TS, and add sufficient 0.1 N

sodium hydroxide to obtain a persistent pink color. Transfer 60 mL of this solution to a suitable container, add about 6 g of Octocrylene, accurately weighed, mix, and titrate with 0.1 N sodium hydroxide: not more than 0.18 mL of titrant per g of Octocrylene is necessary to obtain a persistent pink endpoint.

Chromatographic purity—

Test solution—Use the *Assay preparation*.

Chromatographic system—Proceed as directed in the *Assay*. To evaluate the system suitability requirements, use the *Standard preparation* prepared as directed in the *Assay*.

Procedure—Inject a volume (about 1 μL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Octocrylene taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all the peaks: not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities is found.

Assay—

Standard preparation—Dissolve an accurately weighed quantity of USP Octocrylene RS in acetone, and dilute quantitatively, and stepwise if necessary, with acetone to obtain a solution having a known concentration of about 21.0 mg per mL.

Assay preparation—Transfer about 2.1 g of Octocrylene, accurately weighed, to a 100-mL volumetric flask, dilute with acetone to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 60-m column coated with a 0.25-μm film of G1. Helium is used as the carrier gas at a flow rate of about 6 mL per minute. The split ratio is 30:1. The chromatograph is programmed as follows. Initially the temperature of the column is equilibrated at 80°; upon injection, the temperature is increased at a rate of 4° per minute to 280°, and is held at 280° for 10 minutes. The injection port temperature is maintained at 300°, and the detector temperature is maintained at 300°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between the octocrylene and any other peak is not less than 1.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{27}NO_2$ in the portion of Octocrylene taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Octocrylene RS in the *Standard preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Octreotide Acetate

$C_{49}H_{66}N_{10}O_{10}S_2 \cdot xC_2H_4O_2$ 1019 (as free base)
 L-Cysteinamide, D-phenylalanyl-L-cysteinyl-L-phenylalanyl-D-tryptophyl-L-lysyl-L-threonyl-N-[2-hydroxy-1-(hydroxymethyl)propyl]-, cyclic (2→7)-disulfide, [R-(R*, R*)]-, acetate (salt);
 D-Phenylalanyl-L-cysteinyl-L-phenylalanyl-D-tryptophyl-L-lysyl-L-threonyl-N-[(1R,2R)-2-hydroxy-1-(hydroxymethyl)propyl]-L-cysteinamide cyclic (2→7)-disulfide acetate (salt);
 D-Phenylalanyl-L-hemicystyl-L-phenylalanyl-D-tryptophyl-L-lysyl-L-threonyl-L-hemicystyl-L-threoninol cyclic (2→7)-disulfide acetate (salt) [79517-01-4].

DEFINITION

Octreotide Acetate is a long-acting synthetic octapeptide with pharmacologic properties mimicking those of the natural hormone somatostatin. It contains NLT 95.0% and NMT 105.0% of octreotide ($C_{49}H_{66}N_{10}O_{10}S_2$), calculated on the anhydrous, acetic acid-free basis.

IDENTIFICATION

• A. HPLC

Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Identification sample solution: Mix an equal volume of the *Standard solution* and the *Sample solution*.

Analysis

Samples: *Identification sample solution, Standard solution, and Sample solution*

Examine the chromatograms of the *Identification sample solution, Standard solution, and Sample solution*.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, and the major peak of the *Identification sample solution* elutes as a single peak.

• B. AMINO ACID ANALYSIS

[NOTE—The following method is given for informational purposes; any validated amino acid analysis method can be used.]

Diluent: 0.1 M hydrochloric acid

Standard amino acid mixture: 2500 nmol/mL of Lys, His, NH₃, Arg, Asp, Thr, Ser, Glu, Pro, Gly, Ala, Val, Met, Ile, Leu, Tyr, Phe, and 1250 nmol/mL of Cys-Cys in Diluent

Standard tryptophan solution: 0.2042 mg/mL of tryptophan in Diluent. This solution contains 1000 nmol/mL of Trp.

Standard threoninol solution: 0.1052 mg/mL of Thr-ol in Diluent. This solution contains 1000 nmol/mL Thr-ol. [NOTE—1000 nmol/mL = 1 mM]

Standard solution: Diluent, *Standard amino acid mixture, Standard tryptophan solution, and Standard threoninol solution* (76:4:10:10). The concentration is 100.0 nmol/mL for each amino acid.

Sample solution A: Weigh 1.00–1.50 mg of Octreotide Acetate into a 5-mL ampule. Add 1000 µL of Diluent and 1.2 mL of 30% (w/w) hydrochloric acid, cool the ampule in dry ice, evacuate, and seal by melting. Heat the ampule for 16 h at 115°. Allow to cool and transfer

the contents of the ampule quantitatively into a 25-mL round-bottomed flask, rinse with Diluent, and evaporate to dryness on a rotary evaporator. Dissolve the residue in 10.00 mL of Diluent.

Sample solution B: Weigh 1.00–1.50 mg of Octreotide Acetate into a 5-mL ampule. Add 1000 µL of Diluent and 1.2 mL of 30% (w/w) hydrochloric acid with 1% (v/v) thioglycolic acid, cool the ampule in dry ice, evacuate, and seal by melting. Heat the ampule for 16 h in a heating block at 115°. Allow to cool and transfer the contents of the ampule quantitatively into a 25-mL round-bottomed flask, rinse with Diluent, and evaporate to dryness on a rotary evaporator. Dissolve the residue in 10.00 mL of Diluent.

Analysis

Samples: *Standard solution, Sample solution A, and Sample solution B*

Standardize the instrument with the *Standard solution*.

Inject a suitable volume of *Standard solution, Sample solution A, and Sample solution B*. Evaluate the peak areas of each amino acid found in relation to the peak areas of the respective amino acids in the *Standard solution*, express the content of each amino acid in nmoles.

Calculate A, the average number of nmoles of the amino acids found to be stable under hydrolysis conditions (three stable amino acids—2 Phe and 1 Lys) taken:

$$A = N_T/3$$

N_T = total nmoles of the stable amino acids

Calculate the ratio of the amino acids taken:

$$\text{Result} = N_E/A$$

N_E = nmoles of each amino acid

[NOTE—For Trp use only data obtained with *Sample solution B*. For Cys use only data obtained with *Sample solution A*.]

Acceptance criteria: See Table 1.

Table 1

Name	Acceptance Criteria
Thr	0.7–1.1
Lys	0.9–1.3
Phe	1.8–2.2
Trp	0.4–1.1
Cys	1.0–2.2
Thr-ol	0.6–1.3

ASSAY

• PROCEDURE

Solution A: 0.02% (v/v) of trifluoroacetic acid in water

Solution B: Acetonitrile

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	90	10
25	65	35
30	10	90
35	10	90
40	90	10
45	90	10

System suitability solution: 0.5 mg/mL of USP Octreotide Acetate RS and 0.2 mg/mL of USP Octreotide Non-Cyclic System Suitability Marker RS in *Solution A*

Standard solution: 0.5 mg/mL of USP Octreotide Acetate RS in *Solution A*

Sample solution: 0.5 mg/mL of Octreotide Acetate in *Solution A*. [NOTE—Place Octreotide Acetate in a desiccator containing saturated sodium chloride solution for at least 30 min before weighing. Determine the water content by suitable analysis.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 4-μm packing L87

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The retention times for octreotide and non-cyclic octreotide in the *System suitability solution* are about 16.5 and 18.5 min, respectively.]

Suitability requirements

Resolution: NLT 2.0 between octreotide and non-cyclic octreotide, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of octreotide (C₄₉H₆₆N₁₀O₁₀S₂) in the portion of Octreotide Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [100/(100 - W - Ac)] \times 100$$

r_U = peak response of octreotide from the *Sample solution*

r_S = peak response of octreotide from the *Standard solution*

C_S = concentration of USP Octreotide Acetate RS in the *Standard solution* (mg/mL)

C_U = concentration of Octreotide Acetate in the *Sample solution* (mg/mL)

W = water content in the Octreotide Acetate sample (%)

Ac = acetic acid content in the Octreotide Acetate sample (%)

Acceptance criteria: 95.0%–105.0% on the anhydrous, acetic acid-free basis

OTHER COMPONENTS

PRODUCT-RELATED SUBSTANCES AND IMPURITIES

• OCTREOTIDE ACETATE RELATED COMPOUNDS

[NOTE—Manufacturers should determine the suitability of their related substances method for their process-related and degradation impurities. For any impurity peak above the limit for unspecified impurity peaks, identification and appropriate qualification is required.]

Solution A, Solution B, Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity taken, disregarding any peak with a retention time of less than 5 min and any peak with an area less than 0.1% of the main peak:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of the peak responses from the *Sample solution*, excluding those of the solvent peaks

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Acetyl-Lys ⁵ -octreotide ^a	1.4	0.5
Acetyl-Phe ¹ -octreotide ^b	1.5	0.5
Unspecified impurity	—	0.5
Total impurities	—	2.0

^a D-Phenylalanyl-L-hemicystyl-L-phenylalanyl-D-tryptophyl-(N-acetyl)-L-lysyl-L-threonyl-L-hemicystyl-L-threonyl cyclic (2→7)-disulfide.

^b (N-Acetyl)-D-Phenylalanyl-L-hemicystyl-L-phenylalanyl-D-tryptophyl-L-lysyl-L-threonyl-L-hemicystyl-L-threonyl cyclic (2→7)-disulfide.

PROCESS-RELATED IMPURITIES

- **TRIFLUOROACETIC ACID (TFA) IN PEPTIDES** (503.1): NMT 0.25%.

[NOTE—Perform this test if trifluoroacetic acid is used in the manufacturing process.]

SPECIFIC TESTS

- **WATER DETERMINATION** (921), *Method I*: NMT 10.0%
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 466 USP Endotoxin Units/mg of octreotide acetate
- **MICROBIAL ENUMERATION TESTS** (61) AND **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT 100 cfu/g. The total yeast and mold count is NMT 100 cfu/g.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in air-tight containers. Store at a temperature of 2°–8°, protected from light.
- **USP REFERENCE STANDARDS** (11)
 - USP Endotoxin RS
 - USP Octreotide Acetate RS
 - USP Octreotide Non-Cyclic System Suitability Marker RS

Ofloxacin

C₁₈H₂₀FN₃O₄ 361.37
 7H-Pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid, 9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-, (±);
 (±)-9-Fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid [82419-36-1].

DEFINITION

Ofloxacin contains NLT 98.5% and NMT 101.5% of ofloxacin (C₁₈H₂₀FN₃O₄), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. ULTRAVIOLET ABSORPTION (197U)**
Medium: 0.1 N perchloric acid
Sample solution: 6.7 µg/mL in Medium
Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample: 100 mg of Ofloxacin
Analysis: Dissolve the *Sample* in 275 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass-silver chloride electrode system (see *Titrimetry* (541)). Use the first of the two inflection points. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 36.138 mg of $C_{18}H_{20}FN_3O_4$.
Acceptance criteria: 98.5%–101.5% on the dried basis

Diluent: Acetonitrile and water (1:6)
Buffer: 3.1 g/L of ammonium acetate and 5.4 g/L of sodium perchlorate in water. Adjust with phosphoric acid to a pH of 2.2.
Mobile phase: Acetonitrile and *Buffer* (240:1300)
System suitability solution: 0.4 µg/mL each of USP Ofloxacin RS and USP Ofloxacin Related Compound A RS in *Diluent*
Standard solution: 0.4 µg/mL of USP Ofloxacin RS in *Diluent*

Sample solution: 0.2 mg/mL of Ofloxacin in *Diluent*
Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 294 nm

Column: 4.6-mm × 15-cm; packing L1

Column temperature: 45°

Flow rate: 0.5 mL/min

Injection volume: 10 µL

Run time: 2.5 times the retention time of the ofloxacin peak

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 2.0 between ofloxacin and ofloxacin related compound A

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Ofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response of ofloxacin from the *Standard solution*

C_S = concentration of USP Ofloxacin RS in the *Standard solution* (µg/mL)

C_U = concentration of the *Sample solution* (µg/mL)

Acceptance criteria

Individual impurities: NMT 0.3%. Disregard any peak less than 0.02%.

Total impurities: NMT 0.5%

• **LIMIT OF METHANOL AND ETHANOL**

Internal standard solution: 5.6 mL/mL of *n*-propyl alcohol in sodium hydroxide solution (1 in 100)

Standard solution: 10.0 µg/mL each of methanol and dehydrated alcohol in *Internal standard solution*. Transfer 2 mL of this solution to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 90° for 2 min, and shake for 6 min.

Sample solution: Transfer 40 mg of Ofloxacin to a vial fitted with a septum and crimp cap, add 2 mL of *Internal standard solution*, and seal the vial. Heat the sealed vial at 90° for 2 min, and shake for 6 min.

Blank: Transfer 2 mL of *Internal standard solution* to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 90° for 2 min, and shake for 6 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m fused silica column, coated with a 3.0-µm film of stationary phase G43, and a fused silica precolumn

Temperatures

Injector: 170°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
35	—	35	3
35	20	90	—
90	40	200	2

Condition the column with the helium flowing at 200° for 2 h or until a stable baseline is obtained.

Carrier gas: Helium

Flow rate: 7 mL/min

Injection volume: 1-mL headspace. Use a heated, gas-tight syringe to make injections of the headspace into the chromatograph.

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methanol, ethanol, and *n*-propyl alcohol are 0.5, 0.6, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methanol and ethanol

Relative standard deviation: NMT 5%

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Calculate the percentage of methanol and ethanol in the portion of Ofloxacin taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of methanol or ethanol to the internal standard, corrected for the blank, from the *Sample solution*

R_S = peak response ratio of methanol or ethanol to the internal standard, corrected for the blank, from the *Standard solution*

C_S = concentration of methanol or ethanol in the *Standard solution* (µg/mL)

C_U = concentration of Ofloxacin in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.005% of methanol and NMT 0.05% of ethanol

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation (781S)**
Sample solution: 10 mg/mL in chloroform
Acceptance criteria: $+1^\circ$ to -1°
- **LOSS ON DRYING (731)**
Analysis: Dry at 105° for 4 h.
Acceptance criteria: NMT 0.2%

AnalysisSamples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

 r_U = peak response of the impurity from the *Sample solution* r_S = peak response of ofloxacin from the *Standard solution* C_S = concentration of USP Ofloxacin RS in the *Standard solution* (mg/mL) C_U = nominal concentration of ofloxacin in the *Sample solution* (mg/mL) F = relative response factor for each impurity (see *Impurity Table 1*)Acceptance criteria: See *Impurity Table 1*.**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity A ^a	0.5	1	0.3
Impurity B ^b	3.6	0.22	0.3
Any other impurity	—	1	0.2
All impurities	—	—	1.0

^a (2,3-Dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid).^b (9,10-Difluoro-3-methyl-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid).**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS (11)**
USP Olanzapine RS

Hydrophilic Ointment

DEFINITION

Prepare Hydrophilic Ointment as follows.

Methylparaben	0.25 g
Propylparaben	0.15 g
Sodium Lauryl Sulfate	10 g
Propylene Glycol	120 g
Stearyl Alcohol	250 g
White Petrolatum	250 g
Purified Water	370 g
To make about	1000 g

Melt the *Stearyl Alcohol* and the *White Petrolatum* on a steam bath, and warm to about 75°. Add the other ingredients, previously dissolved in *Purified Water* and warmed to 75°, and stir the mixture until it congeals.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers.

White Ointment

DEFINITION

Prepare White Ointment as follows.

White Wax	50 g
White Petrolatum	950 g
To make	1000 g

Melt the *White Wax* in a suitable dish on a water bath, add the *White Petrolatum*, warm until liquefied, then discontinue the heating, and stir the mixture until it begins to congeal.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in well-closed containers.

Yellow Ointment

DEFINITION

Prepare Yellow Ointment as follows.

Yellow Wax	50 g
Petrolatum	950 g
To make	1000 g

Melt the *Yellow Wax* in a suitable dish on a steam bath, add the *Petrolatum*, warm until liquefied, then discontinue the heating, and stir the mixture until it begins to congeal.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in well-closed containers.

Olanzapine

$C_{17}H_{20}N_4S$ 312.43
10*H*-Thieno[2,3-*b*][1,5]benzodiazepine, 2-methyl-4-(4-methyl-1-piperazinyl)-;
2-Methyl-4-(4-methyl-1-piperazinyl)-10*H*-thieno[2,3-*b*][1,5]benzodiazepine [132539-06-1].

DEFINITION

Olanzapine contains NLT 98.0% and NMT 102.0% of olanzapine ($C_{17}H_{20}N_4S$), calculated on the anhydrous, solvent-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: Dissolve 6.9 g of monobasic sodium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.5, and dissolve 12 g of sodium dodecyl sulfate in the resulting solution.

Mobile phase: Acetonitrile and *Buffer* (47:53)

System suitability solution: 0.1 mg/mL of USP

Olanzapine RS and 0.01 mg/mL of USP Olanzapine Related Compound A RS in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Olanzapine RS in *Mobile phase*

Sample solution: 0.1 mg/mL of Olanzapine in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for olanzapine related compound A and olanzapine are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between olanzapine related compound A and olanzapine

Tailing factor: 0.8–1.5 for the olanzapine peak

Relative standard deviation: NMT 1.0% for the olanzapine peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of olanzapine ($C_{17}H_{20}N_4S$) in the portion of Olanzapine taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

C_u = concentration of Olanzapine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous, solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 ppm (Official 1-

Jan-2018)

- **ORGANIC IMPURITIES**

Buffer: Dissolve 13 g of sodium dodecyl sulfate in 1500 mL of water. Add 5 mL of phosphoric acid, and adjust with a sodium hydroxide solution to a pH of 2.5.

Solution A: Acetonitrile and Buffer (48:52)

Solution B: Acetonitrile and Buffer (70:30)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
20	0	100
25	0	100
27	100	0
35	100	0

Eдетate disodium solution: 37 mg/L of edetate disodium in Buffer

Diluent: Acetonitrile and Eдетate disodium solution (40:60)

System suitability solution: 20 µg/mL of USP Olanzapine RS and 2 µg/mL each of USP Olanzapine Related Compound A RS and USP Olanzapine Related Compound B RS in Diluent

Standard solution: 2 µg/mL of USP Olanzapine RS in Diluent

Sample solution: 0.4 mg/mL of Olanzapine in Diluent

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Temperatures

Column: 35°

Sample: 5°

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: System suitability solution

[NOTE—Identify the peaks using the Relative Retention Time values given in Table 2.]

Suitability requirements

Resolution: NLT 3.0 between olanzapine related compound A and olanzapine

Tailing factor: NMT 1.5 for the olanzapine peak

Relative standard deviation: NMT 2.0% from four replicate injections for the olanzapine peak

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Olanzapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the Sample solution

r_S = peak response of olanzapine from the Standard solution

C_S = concentration of USP Olanzapine RS in the Standard solution (mg/mL)

C_U = concentration of Olanzapine in the Sample solution (mg/mL)

F = relative response factor for each impurity from Table 2

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Olanzapine related compound B ^a	0.3	2.3	0.10
Olanzapine related compound A ^b	0.8	2.3	0.10
Olanzapine	1.0	—	—
Chloromethyl olanzapinium chloride ^c (if present)	1.1	1.0	0.15
Any individual, unspecified impurity	—	—	0.10
Total impurities	—	—	0.4

^a 2-Methyl-10H-thieno-[2,3-b][1,5]benzodiazepin-4[5H]-one.

^b 5-Methyl-2-((2-nitrophenyl)amino)-3-thiophenecarbonitrile.

^c 1-Chloromethyl-1-methyl-4-(2-methyl-10H-benzo[b]thieno[2,3-e][1,4]diazepin-4-yl)piperazin-1-ium chloride.

SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921)

[NOTE—A suitable solvent system for water determination in ketones and aldehydes (e.g., Hydranal composite 5K-working medium K or Aquastar composite 5K-solvent KC or equivalent) is recommended.]

Acceptance criteria: NMT 1.0%

Olanzapine Tablets

DEFINITION

Olanzapine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$).

IDENTIFICATION

- **INFRARED ABSORPTION** (197K)

Standard: Dissolve 10 mg of USP Olanzapine RS in 10 mL of chloroform. Evaporate to dryness on a water bath maintained at 55°. Use about 2 mg of the residue to prepare a potassium bromide pellet.

Sample: Crush NLT 5 Tablets, and transfer the powder equivalent to 30 mg of olanzapine to a suitable container. Add 30 mL of chloroform, and sonicate for 15 min to dissolve. Pass through a suitable filter, and evaporate the filtrate to dryness on a water bath maintained at 55°. Use about 2 mg of the residue to prepare a potassium bromide pellet.

Acceptance criteria: Meet the requirements

ASSAY

PROCEDURE

[NOTE—A few drops of acetonitrile, not to exceed 5% of the final volume, may be added to the *Standard solution* and *Sample solution* before final dilution to reduce foaming.]

Buffer 1: 6.9 g/L of monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 2.5.

Buffer 2: 12 g/L of sodium dodecyl sulfate in *Buffer 1*

Mobile phase: Acetonitrile and *Buffer 2* (1:1)

System suitability solution: 0.1 mg/mL of USP Olanzapine RS and 0.01 mg/mL of USP Olanzapine Related Compound A RS in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Olanzapine RS in *Mobile phase*

Sample solution: Transfer a known quantity of Tablets (NLT 5), equivalent to NLT 25 mg of olanzapine, to a suitable volumetric flask. Dilute with *Mobile phase* to volume, mix, and sonicate for 10 min. Centrifuge a portion of this solution, and dilute the clear supernatant with *Mobile phase* to obtain a solution containing about 0.1 mg/mL of olanzapine. [NOTE—Agitation of the flask may be necessary before sonication to prevent Tablets from adhering to the flask, making disintegration and dissolution difficult.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for olanzapine related compound A and olanzapine are 0.89 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between olanzapine and olanzapine related compound A, *System suitability solution*

Tailing factor: NMT 1.8, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of olanzapine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Mobile phase: 10 g/L of ammonium acetate in a mixture of methanol and water (2:3). Adjust with hydrochloric acid to a pH of 4.0.

Standard solution: ($L/1000$) mg/mL of USP Olanzapine RS in *Medium*, where L is the label claim in mg/Tablet. Transfer 5.0 mL of this solution to a tube, and add 2.0 mL of *Mobile phase*.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size. Transfer 5.0 mL of the filtrate to a tube, and add 2.0 mL of *Mobile phase*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 5-μm packing L10

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 20 min

Mobile phase: 10 g/L of ammonium acetate in a mixture of methanol and water (2:3). Adjust with hydrochloric acid to a pH of 4.0. Pass through a suitable filter of 0.45-μm pore size.

Standard stock solution: 0.28 mg/mL of USP

Olanzapine RS prepared as follows. Transfer a suitable amount of USP Olanzapine RS to a suitable volumetric flask. Add about 8% of the final flask volume of acetonitrile. Sonicate to dissolve the Reference Standard. Dilute with *Medium* to volume.

Standard solution: ($L/900$) mg/mL of USP Olanzapine RS in *Medium* from *Standard stock solution*, where L is the label claim in mg/Tablet. Transfer 5.0 mL of this solution to a tube, and add 2.0 mL of *Mobile phase*.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size. Transfer 5.0 mL of the filtrate to a tube, and add 2.0 mL of *Mobile phase*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 5-μm packing L11

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Olanzapine RS in the Standard solution (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

[NOTE—A few drops of acetonitrile, not to exceed 5% of the final volume, may be added to the Standard solution and Sample solution before final dilution to reduce foaming.]

Buffer 1: 3.3 mL/L of phosphoric acid. Adjust with 50% sodium hydroxide to a pH of 2.5.

Buffer 2: 8.7 g/L of sodium dodecyl sulfate in Buffer 1

Buffer 3: 18.6 mg/L of edetate disodium (EDTA) in Buffer 2

Solution A: Acetonitrile and Buffer 2 (12:13)

Solution B: Acetonitrile and Buffer 2 (7:3)

Diluent: Acetonitrile and Buffer 3 (2:3)

System suitability solution: 20 µg/mL of USP

Olanzapine RS and 2 µg/mL each of USP Olanzapine Related Compound B RS and USP Olanzapine Related Compound C RS in Diluent

Standard solution: 0.002 mg/mL of USP Olanzapine RS in Diluent

Sensitivity solution: 0.4 µg/mL of USP Olanzapine RS in Diluent from the Standard solution

Sample solution: Nominally 0.375–0.500 mg/mL of olanzapine from a suitable number of Tablets prepared as follows. Transfer a known quantity of Tablets to a suitable volumetric flask, and dilute with Diluent to volume. Centrifuge a portion of this solution, and use the supernatant. [NOTE—Immediate agitation of the flask may be necessary to prevent Tablets from adhering to the flask, making dissolution and disintegration difficult. **[CAUTION—Do not sonicate.]** The Sample solution is stable for 12 h at room temperature and 48 h if refrigerated.]

Mobile phase: See Table 1.

Olanzapine and Fluoxetine Capsules

DEFINITION

Olanzapine and Fluoxetine Capsules contain an amount of Olanzapine and Fluoxetine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% each of the labeled

amount of olanzapine ($C_{17}H_{20}N_4S$) and fluoxetine ($C_{17}H_{18}F_3NO$).

IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: 37 mg/L of disodium ethylenediaminetetraacetate in water. Add 3.3 mL of phosphoric acid, and adjust with 50% sodium hydroxide to a pH of 2.5. Dissolve 8.7 g of sodium dodecyl sulfate in the resulting solution.

Mobile phase: Acetonitrile and *Buffer* (1:1)

Standard solution: 0.12 mg/mL of USP Olanzapine RS and 0.45 mg/mL of USP Fluoxetine Hydrochloride RS in *Mobile phase*

Sample solution: Nominally 0.06–0.18 mg/mL of olanzapine and 0.25–0.5 mg/mL of fluoxetine in *Mobile phase* from a counted number of Capsules prepared as follows. Place the Capsules (including shells) into a suitable volumetric flask and fill to about half volume with *Mobile phase*. Mix for NLT 30 min. If disintegration is incomplete, sonicate for NMT 5 min. Dilute with *Mobile phase* to volume, mix, and filter or centrifuge.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm \times 7.5-cm; 3.5- μ m packing L7

Column temperature: 40°

Flow rate: 2 mL/min

Injection volume: 10 μ L

Run time: 2.5 times the retention time of olanzapine

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for olanzapine and fluoxetine are 1.0 and 1.5, respectively.]

Suitability requirements

Resolution: NLT 2.0 between olanzapine and fluoxetine

Relative standard deviation: NMT 2.0% for the olanzapine and fluoxetine peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of olanzapine from the *Sample solution*

r_S = peak response of olanzapine from the *Standard solution*

C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of olanzapine in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of fluoxetine ($C_{17}H_{18}F_3NO$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of fluoxetine from the *Sample solution*

r_S = peak response of fluoxetine from the *Standard solution*

C_S = concentration of USP Fluoxetine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of fluoxetine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of fluoxetine, 309.33

M_{r2} = molecular weight of fluoxetine hydrochloride, 345.79

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated. [NOTE—Helium sparging recommended.]

Apparatus 2: 50 rpm, with 3-prong sinkers

Time: 30 min for both olanzapine and fluoxetine

Standard solution: USP Olanzapine RS and USP Fluoxetine Hydrochloride RS in *Medium* to obtain a final concentration of (L/1000) mg/mL each, where L is the Capsule label claim, in mg

Sample solution: Pass a portion of the solution through a suitable filter of 0.45- μ m pore size.

Buffer, Mobile phase, Chromatographic system, System suitability, and Analysis: Proceed as directed in the *Assay*.

Calculate the percentage of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of olanzapine from the *Sample solution*

r_S = peak response of olanzapine from the *Standard solution*

C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

L = label claim for olanzapine (mg/Capsule)

V = volume of *Medium*, 900 mL

Calculate the percentage of the labeled amount of fluoxetine ($C_{17}H_{18}F_3NO$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

r_U = peak response of fluoxetine from the *Sample solution*

r_S = peak response of fluoxetine from the *Standard solution*

C_S = concentration of USP Fluoxetine Hydrochloride RS in the *Standard solution* (mg/mL)

L = label claim for fluoxetine (mg/Capsule)

M_{r1} = molecular weight of fluoxetine, 309.33

M_{r2} = molecular weight of fluoxetine hydrochloride, 345.79

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amounts of olanzapine ($C_{17}H_{20}N_4S$) and fluoxetine ($C_{17}H_{18}F_3NO$) are dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

ORGANIC IMPURITIES

Buffer and Mobile phase: Proceed as directed in the *Assay*.

System suitability solution: 0.1 mg/mL of USP Olanzapine RS, 0.11 mg/mL of USP Fluoxetine Hydrochloride RS, and 0.002 mg/mL each of α [(2-methylamino)ethyl] benzyl alcohol, trifluoro-*p*-cresol, USP Fluoxetine Related Compound B RS, and USP Olanzapine Related Compound B RS in *Mobile phase*

Standard solution: 2 μ g/mL of USP Olanzapine RS and 8 μ g/mL of USP Fluoxetine Hydrochloride RS in *Mobile phase*

Sample solution: Empty the Capsules, and combine the contents in a suitable container. The contents of the Capsules may be powdered in a mortar, if necessary. Transfer an amount of the sample to a suitable volumetric flask to obtain nominally 0.2 mg/mL of olanzapine and 0.27–1.7 mg/mL of fluoxetine and fill to about 70% volume with *Mobile phase*. Mix for about 5 min. Dilute with *Mobile phase* to volume, mix, and filter or centrifuge.

INFRARED ABSORPTION (197K)****Standard:** Add 25 mg of USP Olanzapine RS to a suitable container containing 10 mL of water. Centrifuge for 5 min, and discard the supernatant. Dry the olanzapine under vacuum for 1 h at 60°.**Sample:** Place 1 Tablet in 10 mL of water in a centrifuge tube. Centrifuge for 5 min. Wash the precipitate with 5 mL of water, and centrifuge for 5 min. Discard the water, and repeat the process a third time. Dry the olanzapine under vacuum for 1 h at 60°.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: Acetonitrile and water (20:80). Add 2 mL of perchloric acid to each L of the mixture.

Solution B: Acetonitrile and water (60:40). Add 2 mL of perchloric acid to each L of the mixture.

Diluent: Acetonitrile and water (35:65)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	87	13
10	87	13
20	0	100
26	0	100
26.1	87	13
36	87	13

System suitability solution: 0.1 mg/mL of USP Olanzapine RS and 10 µg/mL of USP Olanzapine Related Compound C RS in *Diluent*

Standard solution: 0.1 mg/mL of USP Olanzapine RS in *Diluent*

Sample stock solution: 0.5–0.6 mg/mL of olanzapine from NLT 10 Tablets, prepared as follows. Transfer the Tablets to a suitable volumetric flask. Add *Diluent* to fill about 80% of the flask volume. Shake mechanically for 10 min, and dilute with *Diluent* to volume.

Sample solution: Nominally, 0.1–0.12 mg/mL of olanzapine from the *Sample stock solution* in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between the olanzapine and olanzapine related compound C peaks, *System suitability solution*

Tailing factor: NMT 2.0 for the olanzapine peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of olanzapine (C₁₇H₂₀N₄S) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of olanzapine from the *Sample solution*

r_S = peak response of olanzapine from the *Standard solution*

C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of olanzapine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISINTEGRATION (701)

Test 1: NMT 10 s for each of 6 units

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Disintegration Test 2*

Acceptance criteria: NMT 30 s

DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 10 min

Standard solution: (L/900) mg/mL of USP Olanzapine RS in *Medium*

Sample solution: A portion of the solution under test may be either centrifuged or filtered through a suitable membrane filter of 0.45-µm pore size, discarding the first few mL. The filtrate or centrifugate may be suitably diluted.

Determine the amount of olanzapine (C₁₇H₂₀N₄S) dissolved by using either the *Spectrometric procedure* or *Chromatographic procedure* described below:

Spectrometric procedure

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV-Vis

Analytical wavelength: 344 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of olanzapine (C₁₇H₂₀N₄S) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Chromatographic procedure

Buffer: 6.8 g/L of sodium acetate trihydrate in water.

Adjust with glacial acetic acid to a pH of 5.0.

Mobile phase: Acetonitrile and *Buffer* (25:75)

Chromatographic system

Oleovitamin A and D**DEFINITION**

Oleovitamin A and D is a solution of vitamin A and vitamin D in fish liver oil or in an edible vegetable oil. The vitamin D is present as ergocalciferol or cholecalciferol obtained by the activation of ergosterol or 7-dehydrocholesterol, or from natural sources. Oleovitamin A and D contains NLT 90.0% of the labeled amounts of vitamins A and D.

ASSAY**• A. VITAMIN A ASSAY (571)**

Analysis: The acceptance criteria may be met by following any one of the specified procedures described in the *Chemical Methods* or *Chromatographic Methods* in the chapter. The method and procedure used should be stated in the labeling.

Acceptance criteria: NLT 90.0% of the labeled amount

• B. VITAMIN D ASSAY (581)

Analysis: The acceptance criteria may be met by following any one of the specified procedures described in the *Chromatographic Methods* in the chapter. The procedure used should be stated in the labeling.

Acceptance criteria: NLT 90.0% of the labeled amount

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers, protected from light and air, preferably under an atmosphere of an inert gas. Store in a dry place.

• LABELING: Label it to indicate the content of vitamin A in terms of retinol/g. The vitamin A content may also be expressed in USP Vitamin A Units/g. Label it to show

whether it contains ergocalciferol, cholecalciferol, or vitamin D from a natural source. Label it to indicate the vitamin D content, in μg , of ergocalciferol or cholecalciferol/g. Its vitamin D content may be expressed also in USP Vitamin D Units/g.

Oleovitamin A and D Capsules

DEFINITION

Oleovitamin A and D Capsules contain NLT 90.0% of the labeled amounts of vitamins A and D. The oil in Oleovitamin A and D Capsules is a solution of vitamin A and vitamin D in fish liver oil or in an edible vegetable oil. The vitamin D is present as ergocalciferol or cholecalciferol obtained by the activation of ergosterol or 7-dehydrocholesterol or from natural sources.

ASSAY

- **VITAMIN A ASSAY** (571)

Analysis: Use the appropriate *Chemical Method* or *Chromatographic Method* as described in the chapter.

Acceptance criteria: NLT 90.0% of the labeled amount
- **VITAMIN D ASSAY** (581)

Analysis: Use the appropriate *Chromatographic Method* as described in the chapter.

Acceptance criteria: NLT 90.0% of the labeled amount

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store in a dry place.
- **LABELING:** Label the Capsules to indicate the content, in mg, of vitamin A in each Capsule. The vitamin A content in each Capsule may be expressed also in USP Vitamin A Units. Label the Capsules to show whether they contain ergocalciferol, cholecalciferol, or vitamin D from a natural source. Label the Capsules to indicate also the vitamin D content, in μg , in each Capsule. The vitamin D content may be expressed also in USP Vitamin D Units in each Capsule.
- **USP REFERENCE STANDARDS** (11)

Olmesartan Medoxomil

$\text{C}_{29}\text{H}_{30}\text{N}_6\text{O}_6$ 558.59
 1*H*-Imidazole-5-carboxylic acid, 4-[(1-hydroxy-1-methylethyl)-2-propyl-1-[[2'-(1*H*-tetrazol-5-yl) [1,1'-biphenyl]-4-yl]methyl]-, (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl ester; (5-Methyl-2-oxo-1,3-dioxol-4-yl)methyl 1-[[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-4-(2-hydroxypropan-2-yl)-2-propyl-1*H*-imidazole-5-carboxylate [144689-63-4].

DEFINITION

Olmesartan Medoxomil contains NLT 98.5% and NMT 101.5% of $\text{C}_{29}\text{H}_{30}\text{N}_6\text{O}_6$, calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The ratio of the retention time of the major peak to that of the internal standard of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

- **PROCEDURE**

[NOTE—The *Standard solution* and *Sample solution* are stable for 24 h at 5°.]

Diluted phosphoric acid: 0.2% phosphoric acid

Buffer: 0.015 M monobasic potassium phosphate. Adjust the solution with *Diluted phosphoric acid* (w/v) to a pH of 3.4.

Mobile phase: Acetonitrile and *Buffer* (17:33)

Diluent 1: Acetonitrile and water (4:1)

Diluent 2: Acetonitrile and water (2:3)

Internal standard solution: 0.5 mg/mL of 4-hydroxybenzoic acid isobutyl ester in *Diluent 2*. [NOTE—This solution is stable for 1 month at room temperature.]

Standard stock solution: 1 mg/mL of USP Olmesartan Medoxomil RS in *Diluent 1*

Standard solution: 0.05 mg/mL of USP Olmesartan Medoxomil RS from the *Standard stock solution* and 0.025 mg/mL of *p*-hydroxybenzoic acid isobutyl ester from the *Internal standard solution* in *Diluent 2*

Sample stock solution: 1 mg/mL of Olmesartan Medoxomil in *Diluent 1*

Sample solution: 0.05 mg/mL of Olmesartan Medoxomil from the *Sample stock solution* and 0.025 mg/mL of *p*-hydroxybenzoic acid isobutyl ester from the *Internal standard solution* in *Diluent 2*

Chromatographic system
 (See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Omega-3-Acid Ethyl Esters**DEFINITION**

Omega-3-Acid Ethyl Esters is a mixture of ethyl esters, principally the ethyl esters of eicosapentaenoic acid (EPAee) (C20:5 n-3, EE) and docosahexaenoic acid (DHAee) (C22:6 n-3, EE). It may also contain ethyl esters of alpha-linolenic acid (C18:3 n-3, EE), moroctic acid (C18:4 n-3, EE), eicosatetraenoic acid (C20:4 n-3, EE), heneicosapentaenoic acid (C21:5 n-3, EE), and docosapentaenoic acid (C22:5 n-3, EE). Tocopherol may be added as an antioxidant.

IDENTIFICATION

- **A.** The retention times of the principal peaks in *Test solution 4* correspond to those of eicosapentaenoic acid ethyl ester and docosahexaenoic acid ethyl ester in *Standard solution 1b* and *Standard solution 1a*, as obtained in the Assay.
- **B.** It meets the acceptance criteria in *Table 1* of the Assay.

ASSAY

- **CONTENT OF EPAee, DHAee, AND TOTAL OMEGA-3-ACID ETHYL ESTERS**

(See *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.)

Standard solution 1a, Standard solution 1b, Test solution 3, Test solution 4, System suitability solution 1, Chromatographic system, and System suitability: Proceed as directed in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.

Analysis

Samples: *Standard solution 1a, Standard solution 1b, Test solution 3, and Test solution 4*

Calculate the content of EPAee and DHAee in the portion of Omega-3-Acid Ethyl Esters taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

R_U = peak area ratio of the EPAee or DHAee peak to the internal standard peak from *Test solution 3*

R_S = peak area ratio of the EPAee peak to the internal standard peak from *Standard solution 1b* or DHAee peak to the internal standard peak from *Standard solution 1a*

C_S = concentration of USP Eicosapentaenoic Acid Ethyl Ester RS in *Standard solution 1b* or USP Docosahexaenoic Acid Ethyl Ester RS in *Standard solution 1a* (mg/mL)

C_U = concentration of Omega-3-Acid Ethyl Esters in *Test solution 3* (g/mL)

Calculate the content of total omega-3-acid ethyl esters in the portion of Omega-3-Acid Ethyl Esters taken:

$$\text{Result} = r_{\text{FAn-3ee}} [(EPAee + DHAee)/(r_{EPAee} + r_{DHAee})] + EPAee + DHAee$$

$r_{\text{FAn-3ee}}$ = sum of the peak areas of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), and docosapentaenoic acid ethyl ester (C22:5 n-3, EE) in *Test solution 4*

EPAee = content of EPAee (mg/g)

DHAee = content of DHAee (mg/g)

r_{EPAee} = peak area of EPAee in *Test solution 4*

r_{DHAee} = peak area of DHAee in *Test solution 4*

Acceptance criteria: It conforms to the acceptance criteria in *Table 1*. Articles labeled as Omega-3-Acid Ethyl Esters type A meet *Acceptance Criteria II*.

Table 1

Name	Relative Retention Time	Acceptance Criteria I		Acceptance Criteria II (For articles labeled as Omega-3-Acid Ethyl Esters type A)

^d Eicosapentaenoic acid ethyl ester.

^e Heneicosapentaenoic acid ethyl ester.

^f Docosapentaenoic acid ethyl ester (clupanodonic acid ethyl ester).

^g Docosahexaenoic acid ethyl ester.

IMPURITIES

- **FATS AND FIXED OILS (401):** NMT 0.1 ppm each of lead (Pb), cadmium (Cd), arsenic (As), and mercury (Hg)

• **CHOLESTEROL**

Internal standard stock solution: 3 mg/mL of 5 α -cholestane in *n*-heptane. [NOTE—Prepare fresh before use.]

Internal standard solution: 0.3 mg/mL of 5 α -cholestane in *n*-heptane. [NOTE—Prepare fresh before use.]

Standard stock solution: 3.0 mg/mL of cholesterol in *n*-heptane. [NOTE—This solution is stable for 6 months stored in a freezer.] Transfer 1.0 mL of this solution to a 10.0-mL volumetric flask. Dilute with *n*-heptane to volume. [NOTE—Prepare this solution fresh daily.]

Standard solution: Transfer 1.0 mL each of the *Standard stock solution* and the *Internal standard solution* to a 15-mL centrifuge tube. Prepare as directed in the *Sample solution* beginning with "Evaporate to dryness".

Alpha tocopherol stock solution: 1.5–2.0 mg/mL of USP Alpha Tocopherol RS in *n*-heptane. [NOTE—This solution is stable for 12 months stored in a freezer.]

System suitability solution: Mix 1.0 mL of the *Standard stock solution*, 1.0 mL of the *Internal standard stock solution*, and 2.0 mL of the *Alpha tocopherol stock solution* in a 50-mL volumetric flask. Evaporate to dryness with the aid of heat, and dilute with ethyl acetate to volume. Dilute 1.0 mL of this solution with ethyl acetate to 10.0 mL. [NOTE—This solution is stable for 6 months stored in a freezer.]

Sample solution: Transfer 100 mg of Omega-3-Acid Ethyl Esters to a 15-mL centrifuge tube. Add 1.0 mL of the *Internal standard solution*. Evaporate to dryness at about 50° with a gentle stream of nitrogen. Add 0.5 mL of 50% potassium hydroxide and 3 mL of alcohol, fill the tube with nitrogen, and cap. Heat the sample at 100° for 60 min, using a heating block. Cool for about 10 min. Add 6 mL of water to the tube, and shake for 1 min. Extract the solution four times with 2.5-mL portions of ethyl ether, using a vortex mixer or suitable shaker for 1 min for each extraction. Transfer and combine the extracts into a large centrifuge tube, and wash with 5 mL of water, mixing completely with gentle inversion. Remove the water phase, and add 5 mL of 0.5 M potassium hydroxide to the ether phase, mixing carefully to avoid an emulsion. Remove the potassium hydroxide, and add another 5 mL of water, mixing carefully. Transfer the ether phase to a small centrifuge tube. [NOTE—If an emulsion has occurred, a small amount of sodium chloride may be added to obtain a separation of the phases.] Evaporate the ether phase to dryness under a stream of nitrogen with careful heating. Dissolve the sample in 600 µL of ethyl acetate, and mix well. Transfer 200 µL of this solution to a sample vial, and dilute with ethyl acetate to about 2 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m capillary; coated with a G27 phase of 0.25-µm thickness

Temperatures

Injection port: 320°

Detector: 300°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
170	0	170	1
170	4	320	1.5

Carrier gas: Helium

Flow rate: 1.3 mL/min

Injection volume: 1 µL

Injection type: Splitless injection system

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.2 between alpha tocopherol and cholesterol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the content of total cholesterol in the portion of Omega-3-Acid Ethyl Esters taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U)$$

R_U = peak area ratio of the cholesterol peak to the internal standard from the *Sample solution*

R_S = peak area ratio of the cholesterol peak to the internal standard from the *Standard solution*

W_S = weight of cholesterol in the *Standard solution* (mg)

W_U = weight of Omega-3-Acid Ethyl Esters in the *Sample solution* (g)

Acceptance criteria: NMT 3.0 mg/g

• OLIGOMERS

Mobile phase: Tetrahydrofuran

System suitability solution: Monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin in *Mobile phase*, with concentrations of about 0.5, 0.3, and 0.2 mg/mL, respectively. [NOTE—Suitable grades of monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin may be obtained from Nu-Chek Prep.]

Sample solution 1: 5.0 mg/mL of Omega-3-Acid Ethyl Esters in tetrahydrofuran

Sample solution 2: [NOTE—Use *Sample solution 2* where the results of this test using *Sample solution 1* exceed the *Acceptance criteria* due to the presence of monoglycerides.] Weigh 50 mg of Omega-3-Acid Ethyl Esters into a quartz tube, add 1.5 mL of a 20-g/L solution of sodium hydroxide in methanol, cover with nitrogen, cap tightly with a polytef-lined cap, mix, and heat on a water bath for 7 min. Allow to cool. Add 2.0 mL of boron trichloride-methanol solution, cover with nitrogen, cap tightly, mix, and heat on a water bath for 30 min. Cool to 40°–50°, add 1 mL of isooctane, cap, and shake vigorously for NLT 30 s. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and shake thoroughly for NLT 15 s. Transfer the upper layer to a separate tube. Shake the methanol layer with 1 mL of isooctane. Wash the combined isooctane extracts with two quantities, each of 1 mL of water. Carefully evaporate the solvent under a stream of nitrogen, then add 10.0 mL of tetrahydrofuran to the residue. Add a small amount of anhydrous sodium sulfate, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Differential refractometer

Columns: Three concatenated, 7.8-mm × 30-cm; 7-µm packing L21, with pore sizes in the range of 5–50 nm, arranged with decreasing pore size from the injector to the detector to fulfill the system suitability requirements

Flow rate: 0.8 mL/min

Injection volume: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Elution order: Tridocosahexaenoin, didocosahexaenoin, and monodocosahexaenoin

Resolution: NLT 2.0 between monodocosahexaenoin and didocosahexaenoin; NLT 1.0 between didocosahexaenoin and tridocosahexaenoin

Analysis

Samples: *Sample solution 1* and *Sample solution 2*

Measure the areas of the major peaks.

Calculate the percentage of oligomers in the portion of Omega-3-Acid Ethyl Esters taken to prepare *Sample solution 1*:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = sum of the areas of the peaks with a retention time less than that of the ethyl esters peaks

r_T = sum of the areas of all peaks

Calculate the percentage of oligomers in the portion of Omega-3-Acid Ethyl Esters taken to prepare *Sample solution 2*:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = sum of the areas of all peaks with a retention time less than that of the methyl esters peaks
 r_T = sum of the areas of all peaks

Acceptance criteria: NMT 1.0% of oligomers

- **LIMIT OF DIOXINS, FURANS, AND POLYCHLORINATED BIPHENYLS (PCBs):** Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 1 pg/g of WHO toxic equivalents. The sum of PCBs (polychlorinated biphenyls, IUPAC congeners PCB-28, PCB-52, PCB-101, PCB-118, PCB-138, PCB-153, and PCB-180) is NMT 0.5 ppm.

LIMIT OF TOTAL UNIDENTIFIED FATTY ACID ETHYL ESTERS

[NOTE—This test is not required for the articles labeled as Omega-3-Acid Ethyl Esters type A.]

From the chromatogram obtained with *Test solution 4* in the *Assay for Content of EPAee, DHAee, and Total Omega-3-Acid Ethyl Esters*, determine the peak area of the largest single unidentified peak with a relative retention time different from those in *Table 3*.

Table 3

Identified Ethyl Ester	Relative Retention Time
Phytanic acid	0.416
C16:3 n-4	0.431
C16:4 n-1	0.468
C18:3 n-6	0.557
C18:3 n-4	0.574
C18:3 n-3	0.585
C18:4 n-3	0.608
C18:4 n-1	0.618
Furan acid 5	0.691
C19:5	0.710
C20:3 n-6	0.720
C20:4 n-6	0.736
Furan acid 7	0.744
C20:4 n-3	0.777
Furan acid 8	0.783
EPA	0.796
Furan acid 9	0.867
C21:5 n-3	0.889
C22:4	0.917
Furan acid 10	0.922
C22:5 n-6	0.939
Furan acid 11	0.963
C22:5 n-3	0.977
DHA	1.000

Calculate the content of unidentified fatty acid ethyl esters in area percentage:

$$\text{Result} = 100 - (100 \times \Sigma A_{iee}/r_T)$$

A_{iee} = peak area of each identified ethyl ester in *Table 3*

r_T = sum of the areas of all peaks except solvents and BHT

Acceptance criteria: The area of the largest single unidentified peak is NMT 0.5% of the total area. The total area of unidentified peaks as calculated above is NMT 2%.

• **LIMIT OF NON-OMEGA-3-ACID ETHYL ESTERS**

[NOTE—This test is only required for the articles labeled as Omega-3-Acid Ethyl Esters type A.]

From the chromatogram obtained with *Test solution 4* in the *Assay for Content of EPAee, DHAee, and Total Omega-3-Acid Ethyl Esters*, calculate the amounts of C18:1 n-9 ethyl ester and C20:4 n-6 ethyl ester in the portion of Omega-3-Acid Ethyl Esters taken:

$$\text{Result} = (A_{iee}/r_T) \times 100$$

A_{iee} = peak area of C18:1 n-9 ethyl ester or C20:4 n-6 ethyl ester

r_T = sum of the areas of all peaks except solvents and BHT

Acceptance criteria

C18:1 n-9 ethyl ester: NMT 6.0%

C20:4 n-6 ethyl ester: NMT 4.0%

SPECIFIC TESTS

- **FATS AND FIXED OILS (401), Acid Value:** NMT 2.0
- **FATS AND FIXED OILS (401), Anisidine Value:** NMT 15
- **FATS AND FIXED OILS (401), Peroxide Value:** NMT 10.0
- **ABSORBANCE**

Sample solution: Transfer 300 mg, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute immediately with isooctane to volume. Pipet 2.0 mL into a 50-mL volumetric flask, and dilute with isooctane to volume.

Acceptance criteria: NMT 0.55, determined at 233 nm, with isooctane being used as the blank

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers under a nitrogen atmosphere. Store at controlled room temperature.
- **LABELING:** The label states the content of DHA ethyl ester and EPA ethyl ester in mg/g, the sum of the EPA and DHA ethyl esters contents in mg/g, and the content of the total omega-3-acid ethyl esters in weight percentage (w/w). It also states the name of any added antioxidant. Articles intended to meet *Acceptance Criteria II* of the *Assay* and the *Limit of Non-Omega-3-Acid Ethyl Esters* are labeled as Omega-3-Acid Ethyl Esters type A.
- **USP REFERENCE STANDARDS (11)**
 - USP Docosahexaenoic Acid Ethyl Ester RS
All *cis*-4,7,10,13,16,19-docosahexaenoic ethyl ester.
 $C_{24}H_{36}O_2$ 356.55
 - USP Eicosapentaenoic Acid Ethyl Ester RS
All *cis*-5,8,11,14,17-eicosapentaenoic ethyl ester.
 $C_{22}H_{34}O_2$ 330.51
 - USP Methyl Tricosanoate RS
Tricosanoic acid methyl ester.
 $C_{24}H_{48}O_2$ 368.64
 - USP Alpha Tocopherol RS

Omega-3-Acid Ethyl Esters Capsules

DEFINITION

Omega-3-Acid Ethyl Esters Capsules contain Omega-3-Acid Ethyl Esters, with NLT 95.0% and NMT 105.0% of the labeled sum of eicosapentaenoic acid ethyl ester (EPAee) and docosahexaenoic acid ethyl ester (DHAee) and NLT 95% of the labeled amount of total omega-3-acid ethyl esters, as the sum of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), eicosapentaenoic acid ethyl ester (EPAee) (C20:5 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), docosapentaenoic acid ethyl ester (C22:5 n-3, EE), and docosahexaenoic acid ethyl ester (DHAee) (C22:6 n-3, EE). Tocopherol may be added as an antioxidant.

IDENTIFICATION

- **A.** The retention times of the peaks for eicosapentaenoic acid ethyl ester and docosahexaenoic acid ethyl ester of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay for Content of EPAee, DHAee, and Total Omega-3-Acid Ethyl Esters.
- **B.** It complies with the Acceptance criteria in the test for Concentration of Omega-3-Acid Ethyl Esters in *Specific Tests*.

ASSAY

• **CONTENT OF EPAee, DHAee, AND TOTAL OMEGA-3-ACID ETHYL ESTERS**

[NOTE—Carry out the procedure as rapidly as possible, avoiding exposure to actinic light, oxidizing agents, oxidation catalysts (i.e., copper and iron), and air.]

Antioxidant solution: 50 mg/L of butylated hydroxytoluene in isooctane

Retention time identification solution: Prepare a mixture containing suitable concentrations of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), and docosapentaenoic acid ethyl ester (C22:5 n-3, EE) in *Antioxidant solution*.¹

Internal standard solution: 7.0 mg/mL of USP Methyl Tricosanoate RS in *Antioxidant solution*

System suitability solution: 5.5 mg/mL of docosahexaenoic acid methyl ester and 0.5 mg/mL of tetracos-15-enoic acid methyl ester in *Antioxidant solution*

Standard solution: Dissolve 60.0 mg of USP Docosahexaenoic Acid Ethyl Ester RS and 90.0 mg of USP Eicosapentaenoic Acid Ethyl Ester RS in 10.0 mL of *Internal standard solution*.

Sample solution: Weigh NLT 10 Capsules in a tared weighing bottle. With a sharp blade, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of diethyl ether. Discard the washings, and allow the empty Capsules to air-dry over a period of NMT 30 min, taking precautions to avoid uptake or loss of moisture. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average fill weight per Capsule (W_{AF}). Transfer an amount of the combined Capsule contents equivalent to 225 mg of the labeled amount of total omega-3-acid ethyl esters to a suitable flask, and dissolve with 10.0 mL of *Internal standard solution*.

Chromatographic system

(See *Chromatography* {621}, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 25–50-m fused silica capillary; coated with a 0.25-μm film of G16

Temperatures

Injection port: 250°

Detector: 270°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
170	0	170	2
170	3.5	255	9

Carrier gas: Hydrogen or helium

Linear velocity: Adjust to obtain a retention time for docosahexaenoic acid ethyl ester of 26 ± 3 min.

¹ The relevant fatty acid ethyl esters are available from Nu-Chek Prep, Inc. (www.nu-chekprep.com); Cayman Chemical (www.caymanchem.com); and Carbosynth (www.carbosynth.com).

Injection volume: 1 μL

Injection type: Split; split ratio, 1:220

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.2 between docosahexaenoic acid methyl ester and tetracos-15-enoic acid methyl ester peaks, *System suitability solution*

Relative standard deviation: NMT 2.0% for the ratios of the peak responses of DHAee and EPAee relative to the internal standard, *Standard solution*

Analysis

Samples: *Retention time identification solution*, *Standard solution*, and *Sample solution*

Identify the retention times of the relevant fatty acid ethyl esters by comparing the peaks from the *Sample solution* with those from the *Retention time identification solution*.

Calculate the content, in mg/g, of EPAee and DHAee in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

R_U = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Sample solution*

R_S = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Standard solution*

C_S = concentration of USP Eicosapentaenoic Acid Ethyl Ester RS or USP Docosahexaenoic Acid Ethyl Ester RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the total omega-3-acid ethyl esters in the *Sample solution* (g/mL)

Calculate the percentage of the labeled sum of EPAee and DHAee in the portion of Capsules taken:

$$\text{Result} = (EPAee + DHAee) \times W_{AF} \times (100/L)$$

$EPAee$ = content of EPAee in the portion of Capsules taken (mg/g)

$DHAee$ = content of DHAee in the portion of Capsules taken (mg/g)

W_{AF} = average fill weight of the Capsules taken (g)

L = sum of the labeled content of EPAee and DHAee (mg/Capsule)

Calculate the percentage of the labeled amount of total omega-3-acid ethyl esters in the portion of Capsules taken:

$$\text{Result} = \{r_{FAn-3ee} \times [(EPAee + DHAee)/(r_{EPAee} + r_{DHAee})] + EPAee + DHAee\} \times W_{AF} \times (100/L)$$

$r_{FAn-3ee}$ = sum of the peak areas of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), and docosapentaenoic acid ethyl ester (C22:5 n-3, EE) from the *Sample solution*

$EPAee$ = content of EPAee (mg/g)

$DHAee$ = content of DHAee (mg/g)

r_{EPAee} = peak area of EPAee from the *Sample solution*

r_{DHAee} = peak area of DHAee from the *Sample solution*

W_{AF} = average fill weight of the Capsules taken (g)

L = label claim of total omega-3-acids ethyl esters (g/Capsule)

Acceptance criteria: 95.0%–105.0% of the labeled sum of EPAee and DHAee and NLT 95.0% of the labeled amount of total omega-3-acid ethyl esters per Capsule

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905), Weight Variation:** Meet the requirements
- **DISINTEGRATION (701)**
 - Medium, tier 1: Water
 - Medium, tier 2: Simulated gastric fluid TS
 - Time: 30 min
 - Analysis: Perform the test with water as *Medium, tier 1*. Repeat the test with simulated gastric fluid TS as *Medium, tier 2*, if the disintegration time is more than 30 min in *Medium, tier 1*.
 - Acceptance criteria: Meet the requirements

IMPURITIES• **OLIGOMERS**

Mobile phase: Tetrahydrofuran

System suitability solution: Monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin in *Mobile phase*, with concentrations of about 0.5, 0.3, and 0.2 mg/mL, respectively. [NOTE—Suitable grades of monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin may be obtained from Nu-Chek Prep.]

Sample solution 1: 5.0 mg/mL of the Capsule contents in tetrahydrofuran

Sample solution 2: [NOTE—Use *Sample solution 1* where the results of this test using *Sample solution 1* exceed the *Acceptance criteria* due to the presence of monoglycerides.] Weigh 50 mg of the Capsule contents into a quartz tube, add 1.5 mL of a 20-g/L solution of sodium hydroxide in methanol, cover with nitrogen, cap tightly with a polytef-lined cap, mix, and heat on a water bath for 7 min. Allow to cool. Add 2.0 mL of boron trichloride-methanol solution, cover with nitrogen, cap tightly, mix, and heat on a water bath for 30 min. Cool to 40°–50°, add 1 mL of isooctane, cap, and shake vigorously for NLT 30 s. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and shake thoroughly for NLT 15 s. Transfer the upper layer to a separate tube. Shake the methanol layer with 1 mL of isooctane. Wash the combined isooctane extracts with 2 quantities, each of 1 mL of water. Carefully evaporate the solvent under a stream of nitrogen, then add 10.0 mL of tetrahydrofuran to the residue. Add a small amount of anhydrous sodium sulfate, and filter.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: Differential refractometer

Columns: Three concatenated, 7.8-mm × 30-cm; 7-μm packing L21, with pore sizes in the range of 5–50 nm, arranged with decreasing pore size from the injector to the detector to fulfill the system suitability requirements

Flow rate: 0.8 mL/min

Injection volume: 40 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Elution order: Tridocosahexaenoin, didocosahexaenoin, and monodocosahexaenoin

Resolution: NLT 2.0 between monodocosahexaenoin and didocosahexaenoin; NLT 1.0 between didocosahexaenoin and tridocosahexaenoin

Analysis

Samples: *Sample solution 1* and *Sample solution 2*
Measure the areas of the major peaks.

Calculate the percentage of oligomers in the portion of omega-3-acid ethyl esters taken to prepare *Sample solution 1*:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = sum of the peak areas with retention times less than that of the ethyl esters peak

r_T = sum of the areas of all peaks

Calculate the percentage of oligomers in the portion of the Capsules contents taken to prepare *Sample solution 2*:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = sum of the peak areas with retention times less than that of the methyl esters peak

r_T = sum of the areas of all peaks

Acceptance criteria: NMT 2% of oligomers

SPECIFIC TESTS• **CONCENTRATION OF OMEGA-3-ACID ETHYL ESTERS**

Antioxidant solution, Retention time identification solution, Internal standard solution, System suitability solution, Standard solution, Sample solution, Chromatographic system, System suitability, and Analysis: Proceed as directed in the *Assay for Content of EPAee, DHAee, and Total Omega-3-Acid Ethyl Esters*. Calculate the concentration, in mg/g, of EPAee and DHAee in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

R_U = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Sample solution*

R_S = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Standard solution*

C_S = concentration of USP Eicosapentaenoic Acid Ethyl Ester RS or USP Docosahexaenoic Acid Ethyl Ester RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the total omega-3-acid ethyl esters in the *Sample solution* (g/mL)

Calculate the concentration, in mg/g, of total omega-3-acids ethyl esters in the portion of Capsules taken:

$$\text{Result} = r_{\text{FA}\omega-3\text{ee}} \times [(EPA\text{ee} + DHA\text{ee})/(r_{EPA\text{ee}} + r_{DHA\text{ee}})] + EPA\text{ee} + DHA\text{ee}$$

$r_{\text{FA}\omega-3\text{ee}}$ = sum of the peak areas of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), morotic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), and docosapentaenoic acid ethyl ester (C22:5 n-3, EE) from the *Sample solution*

EPAee = content of EPAee (mg/g)

DHAee = content of DHAee (mg/g)

$r_{EPA\text{ee}}$ = peak area of EPAee from the *Sample solution*

$r_{DHA\text{ee}}$ = peak area of DHAee from the *Sample solution*

Acceptance criteria: It meets the requirements in *Table 2*. Capsules labeled as containing Omega-3-Acid Ethyl Esters type A meet *Acceptance Criteria II*.

Table 2

Name	Acceptance Criteria I		Acceptance Criteria II (For capsules labeled as containing omega- 3-acid ethyl esters type A)	
	NLT	NMT	NLT	NMT
EPAee	430 mg/g	495 mg/g	365 mg/g	435 mg/g
DHAee	347 mg/g	403 mg/g	290 mg/g	360 mg/g
EPAee + DHAee	800 mg/g	880 mg/g	700 mg/g	749 mg/g
Total omega-3- acid ethyl esters ^a	90% (w/ w)	—	78% (w/ w)	—

^a Sum of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), morotic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), eicosapentaenoic acid ethyl ester (EPAee) (C20:5 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), docosapentaenoic acid ethyl ester (C22:5 n-3, EE), and docosahexaenoic acid ethyl ester (DHAee) (C22:6 n-3, EE).

• **FATS AND FIXED OILS** (401), *Acid Value*

Sample solution: Dissolve about 5.0 g of the oil, accurately weighed, in 100 mL of a mixture of equal volumes of alcohol and ether (which has been neutralized to phenolphthalein with 0.1 M potassium hydroxide) contained in a flask.

Acceptance criteria: NMT 2.0

• **FATS AND FIXED OILS** (401), *Anisidine Value:* NMT 25

• **FATS AND FIXED OILS** (401), *Peroxide Value:* NMT 10 mEq/kg

• **ABSORBANCE**

Sample solution: Transfer 300 mg, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute immediately with isooctane to volume. Pipet 2.0 mL into a 50-mL volumetric flask, and dilute with isooctane to volume.

Acceptance criteria: NMT 0.60, determined at 233 nm in a 1-cm cell, with isooctane being used as the blank

• **MICROBIAL ENUMERATION TESTS** (61): NMT 10^3 cfu/g for the total aerobic microbial count, and NMT 10^2 cfu/g for the total combined yeasts and molds count.

• **TESTS FOR SPECIFIED MICROORGANISMS** (62): Meet the requirements for absence of *Escherichia coli* in 1 g and for absence of *Salmonella* species in 10 g

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature. Do not freeze. Protect from light.

• **LABELING:** The label states the amount of docosahexaenoic acid (DHA) ethyl ester and eicosapentaenoic acid (EPA) ethyl ester, and the minimum amount of total content of omega-3-acid ethyl esters in mg/Capsule. Capsules intended to meet *Acceptance Criteria II* of the test for *Concentration of Omega-3-Acid Ethyl Esters* are labeled as containing Omega-3-Acid Ethyl Esters type A. It also states the name and content of any added antioxidant.

• **USP REFERENCE STANDARDS** (11)

5-Methoxy-2-[[[4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl]benzimidazole [73590-58-6].

DEFINITION

Omeprazole contains NLT 98.0% and NMT 102.0% of omeprazole ($C_{17}H_{19}N_3O_3S$), calculated on the dried basis.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. INFRARED ABSORPTION** (197K)

ASSAY

• PROCEDURE

Buffer: Dissolve 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 1000 mL of water. Dilute 250 mL of this solution with water to 1000 mL. If necessary, adjust with phosphoric acid to a pH of 7.6.

Mobile phase: Acetonitrile and *Buffer* (1:3)

Diluent: Acetonitrile and 0.01 M sodium borate (1:3)

Standard solution: 0.2 mg/mL of USP Omeprazole RS in *Diluent*

System suitability solution: 0.1 mg/mL of USP Omeprazole RS in *Diluent* from the *Standard solution*

Sample solution: 0.2 mg/mL of Omeprazole in *Diluent*

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Flow rate: 0.8 mL/min

Injection volume: 20 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of omeprazole ($C_{17}H_{19}N_3O_3S$) in the portion of Omeprazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Omeprazole RS in the *Standard solution* (mg/mL)

C_U = concentration of Omeprazole in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 20 ppm • (Official 1-Jan-2018)

• ORGANIC IMPURITIES

Solution A: Dissolve 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 1000 mL of water. Dilute 250 mL of this solution with water to 1000 mL. Adjust with phosphoric acid to a pH of 7.0.

Solution B: Acetonitrile

Mobile phase: See Table 1. Return to the original conditions, and re-equilibrate the system for about 10 min.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
12	75	25
22	50	50
45	50	50
45.1	75	25

Diluent: Solution A and Solution B (3:1)

System suitability solution: 0.6 mg/mL of USP Omeprazole RS, 0.6 µg/mL each of USP Omeprazole Related Compound A RS, USP Omeprazole Related Compound E RS, USP Omeprazole Related Compound I RS, and 5-methoxy-1*H*-benzimidazol-2-thiol in Diluent. [NOTE—This solution is stable for 14 h when stored at 4°.]

Standard solution: 6.0 µg/mL of USP Omeprazole RS in Diluent.

[NOTE—This solution is stable for 14 h when stored at 4°.]

Sample solution: 0.6 mg/mL of Omeprazole in Diluent. [NOTE—Inject within 1 h of preparation.]

Sensitivity solution: 0.3 µg/mL of USP Omeprazole RS from the Standard solution

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 264 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 0.8 mL/min

Injection volume: 40 µL

Autosampler temperature: 4°

System suitability

Samples: System suitability solution, Standard solution, and Sensitivity solution

Suitability requirements

Resolution: NLT 2.0 between omeprazole and omeprazole related compound A, System suitability solution

Relative standard deviation: NMT 5%, Standard solution

Signal-to-noise ratio: NLT 10, Sensitivity solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of any individual impurity in the portion of Omeprazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the Sample solution

r_S = peak response of omeprazole from the Standard solution

C_S = concentration of USP Omeprazole RS in the Standard solution (mg/mL)

C_U = concentration of Omeprazole in the Sample solution (mg/mL)

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2. Disregard any peak below 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
5-Methoxy-1 <i>H</i> -benzimidazol-2-thiol	0.41	1.0	0.15

^c 5-Methoxy-2-[(4-methoxy-3,5-dimethylpyridin-2-yl)methylthio]-1*H*-benzimidazole.

^d Omeprazole related compounds F and G (1,3-dimethyl-8-methoxy-12-thioxopyrido[1',2':3,4]imidazo[1,2-*a*]benzimidazol-2(1*2H*)-one and 1,3-dimethyl-9-methoxy-12-thioxopyrido[1',2':3,4]imidazo[1,2-*a*]benzimidazol-2(1*2H*)-one). These impurities are controlled in the test for Limit of Omeprazole Related Compounds F and G.

SPECIFIC TESTS• **COMPLETENESS OF SOLUTION (641)**

Sample solution: 20 mg/mL of Omeprazole in methylene chloride

Acceptance criteria: Meets the requirements

• **LIMIT OF OMEPRAZOLE RELATED COMPOUNDS F AND G**

Sample solution: 20 mg/mL of Omeprazole in methylene chloride

Instrumental conditions

Mode: Vis

Analytical wavelength: 440 nm

Cell: 1 cm

Blank: Methylene chloride

Acceptance criteria: The absorbance is NMT 0.10, corresponding to NMT 350 ppm of the sum of omeprazole related compounds F and G.

• **LOSS ON DRYING (731)**

Analysis: Dry a sample under vacuum at 60° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cold place, protected from moisture.

• **USP REFERENCE STANDARDS (11)**

 $C_{17}H_{19}N_3O_5S$ 377.41

Omeprazole Delayed-Release Capsules

DEFINITION

Omeprazole Delayed-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_5S$).

IDENTIFICATION

- A.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Solution A: Dissolve 6.0 g of glycine in 1500 mL of water, adjust with 50% sodium hydroxide solution to a pH of 9.0, and dilute with water to 2000 mL.

Solution B: Acetonitrile and methanol (85:15)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	88	12
20	40	60
21	88	12
25	88	12

Diluent: Dissolve 7.6 g of sodium borate decahydrate in about 800 mL of water. Add 1.0 g of edetate disodium, and adjust with 50% sodium hydroxide solution to a pH of 11.0 ± 0.1 . Transfer the solution to a 2000-mL volumetric flask, add 400 mL of dehydrated alcohol, and dilute with water to volume.

Standard solution: 0.2 mg/mL of USP Omeprazole RS in *Diluent*, using sonication as necessary

Sample solution: Weigh and mix the contents of NLT 20 Capsules. Transfer an accurately weighed portion of the Capsule content, equivalent to 20 mg of omeprazole, to a 100-mL volumetric flask, add about 50 mL of *Diluent*, and sonicate for 15 min. Cool, dilute with *Diluent* to volume, mix, and pass through a membrane filter of 0.45- μ m or finer pore size. [NOTE—Bubbles may form just before bringing the solution to volume. Add a few drops of dehydrated alcohol to dissipate the bubbles if they persist for more than a few minutes.]

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 305 nm

Column: 4.6-mm \times 15-cm; 5- μ m base-deactivated packing L7

Flow rate: 1.2 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 20,000 theoretical plates

Tailing factor: 0.8–2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_5S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Omeprazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of omeprazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

Acid resistance stage

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 100 rpm

Time: 2 h

Buffer C, Mobile phase, Chromatographic system, and System suitability: Proceed as directed for *Buffer stage*.

Standard solution: Transfer 50 mg of USP Omeprazole RS to a 250-mL volumetric flask, dissolve in 50 mL of alcohol, and dilute with 0.01 M sodium borate solution to volume. Transfer 10.0 mL of this solution into a 100-mL volumetric flask, add 20 mL of alcohol, dilute with 0.01 M sodium borate solution to volume, and mix.

Sample solution: After 2 h, filter the *Medium* containing the pellets through a sieve with an aperture of NMT 0.2 mm. Collect the pellets on the sieve, and rinse them with water. Using approximately 60 mL of 0.01 M sodium borate solution, carefully transfer the pellets quantitatively to a 100-mL volumetric flask. Sonicate for about 20 min until the pellets are broken up. Add 20 mL of alcohol to the flask, dilute with 0.01 M sodium borate solution to volume, and mix. Dilute an appropriate amount of this solution with 0.01 M sodium borate solution to obtain a solution containing 0.02 mg/mL. At level L_1 , test 6 units. Test 6 additional units at level L_2 , and at level L_3 , test an additional 12 units. Continue testing through the three levels unless the results conform at either L_1 or L_2 .

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_5S$) dissolved in *Medium*, in mg:

$$\text{Result} = T - C_S \times D \times (r_U/r_S)$$

T = labeled quantity of omeprazole in the capsule (mg)

C_S = concentration of USP Omeprazole RS in the *Standard solution* (mg/mL)

D = dilution factor used in preparing the *Sample solution*

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

Tolerances

Level L₁: No individual value exceeds 15% of the omeprazole dissolved.

Level L₂: The average of 12 units is NMT 20% of omeprazole dissolved, and no individual unit is greater than 35% of omeprazole dissolved.

Level L₃: The average of 24 units is NMT 20% of omeprazole dissolved, NMT 2 units are greater than 35% of omeprazole dissolved, and no individual unit is greater than 45% of omeprazole dissolved.

Buffer stage

Medium: pH 6.8 phosphate buffer, 900 mL

Proceed as directed in *Acid resistance stage* with a new set of Capsules from the same batch. After 2 h, add 400 mL of 0.235 M dibasic sodium phosphate to the 500 mL of 0.1 N hydrochloric acid medium in the vessel. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05 .

Apparatus 2: 100 rpm

At the end of 30 min, determine the amount of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved in the pH 6.8 phosphate buffer by using the following method.

Buffer A (0.235 M dibasic phosphate buffer, pH 10.4): 33.36 g/L of anhydrous dibasic sodium phosphate, adjusted with 2 N sodium hydroxide to a pH of 10.4 ± 0.1

Buffer B (phosphate buffer, pH 6.8): 0.1 N hydrochloric acid and *Buffer A* (5:4), adjusted with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of 6.8 ± 0.05 .

Buffer C (phosphate buffer, pH 7.6): 0.718 g/L of monobasic sodium phosphate and 4.49 g/L of dibasic sodium phosphate, adjusted with 2 N hydrochloric acid or 2 N sodium hydroxide, if necessary, to a pH of 7.6 ± 0.1 . Dilute 250 mL of this solution with water to 1000 mL.

Mobile phase: Transfer 340 mL of acetonitrile to a 1000-mL volumetric flask, dilute with *Buffer C* to volume, and pass through a membrane filter of 0.5- μ m or finer pore size.

Standard solution A (for Capsules labeled to contain 10 mg): Prepare a solution containing 2 mg/mL of USP Omeprazole RS in alcohol. Dilute with *Buffer B* to obtain a solution containing 0.01 mg/mL. Immediately add 2 mL of 0.25 M sodium hydroxide to 10 mL of this solution, and mix. [NOTE—Do not allow the solution to stand before adding the sodium hydroxide solution.]

Standard solution B (for Capsules labeled to contain 20 or 40 mg): Proceed as directed for *Standard solution A*, except to obtain a solution containing 0.02 mg/mL before mixing with 2 mL of 0.25 M sodium hydroxide.

Sample solution A (for Capsules containing 10 or 20 mg): Immediately transfer 5.0 mL of the solution under test to a test tube containing 1.0 mL of 0.25 M sodium hydroxide. Mix well, and pass through a membrane filter of 1.2- μ m or finer pore size. Protect from light.

Sample solution B (for Capsules labeled 40 mg): Immediately transfer 5.0 mL of the solution under test to a test tube containing 2.0 mL of 0.25 M sodium hydroxide and 5 mL of *Buffer B*. Mix well, and pass through a membrane filter of 1.2- μ m or finer pore size. Protect from light.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.0-mm \times 12.5-cm; 5- μ m packing L7

Flow rate: 1.0 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution A* or *B*, as appropriate

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved:

$$\text{Result} = (r_u/r_s) \times (C_s/L) \times V \times D \times 100$$

r_u = peak response from the appropriate *Sample solution*

r_s = peak response from the appropriate *Standard solution*

C_s = concentration of the appropriate *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium*, 900 mL

D = dilution factor used in preparing the appropriate *Sample solution*

Tolerances

For Capsules labeled to contain 10 and 20 mg: NLT 75% (Q) is dissolved.

For Capsules labeled to contain 40 mg: NLT 70% (Q) is dissolved.

The percentages of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved at the time specified conform to *Acceptance Table 1* in *Dissolution* (711).

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Acid resistance stage

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 2 h

Sample solution: After 2 h, remove each sample from the basket, and quantitatively transfer into separate volumetric flasks to obtain a solution having a final concentration of about 0.2 mg/mL. Proceed as directed for the *Sample solution* in the *Assay*, starting with "Add about 50 mL of *Diluent*".

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity of the labeled amount of omeprazole ($C_{17}H_{19}N_3O_3S$) dissolved in *Medium*, in mg:

$$\text{Result} = T - C_s \times D \times (r_u/r_s)$$

T = labeled quantity of omeprazole in the capsule (mg)

C_s = concentration of USP Omeprazole RS in the *Standard solution* (mg/mL)

D = dilution factor used in preparing the *Sample solution*

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

Tolerances: See *Table 2*.

Table 2

Level	Criteria
L ₁	The average of the 6 units is NMT 10% of omeprazole dissolved.
L ₂	The average of the 12 units is NMT 10% of omeprazole dissolved.
L ₃	The average of the 24 units is NMT 10% of omeprazole dissolved.

Buffer stage

Medium: 0.05 M pH 6.8 phosphate buffer; 900 mL (see *Reagents, Indicators, and Solutions*)

Apparatus 1: 100 rpm

Time: 45 min

Analysis: Proceed as directed for *Acid resistance stage* with a new set of Capsules from the same batch. After 2 h, replace the acid *Medium* with the buffer *Medium*, and continue the test for 45 more min. Determine the amount of omeprazole (C₁₇H₁₉N₃O₃S) dissolved from UV absorbances at the wavelength of maximum absorbance at about 305 nm on portions of the solutions under test passed through a nylon filter of 0.2-μm pore size, in comparison with a *Standard solution* having a known concentration of USP Omeprazole RS in the same *Medium*.

Tolerances: NLT 75% (Q) is dissolved.

The percentage of the labeled amount of omeprazole (C₁₇H₁₉N₃O₃S) dissolved at the time specified conforms to *Acceptance Table 1* in *Dissolution* (711).

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, Diluent, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 1.0 μg/mL of USP Omeprazole RS in *Diluent*

Peak identification solution: 0.2 mg/mL of USP Omeprazole RS, 1.0 μg/mL of USP Omeprazole Related Compounds F and G Mixture RS, and 1.0 μg/mL of 5-methoxy-1*H*-benzimidazole-2-thiol in *Diluent*. Sonicate the solution for 15 min, and then heat at 55° for 30 min. [NOTE—The heating step facilitates conversion of omeprazole related compounds F and G into a product with the relative retention time of 0.33. The remaining unconverted omeprazole related compounds F and G may elute as a very broad peak at the relative retention time of about 0.5.]

Analysis

Samples: *Standard solution*, *Peak identification solution*, and *Sample solution*

Chromatograph the *Peak identification solution*, and identify the components on the basis of their relative retention times, given in the *Table 3*.

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response for each impurity from the *Sample solution*

r_s = peak response for omeprazole from the *Standard solution*

C_s = concentration of USP Omeprazole RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of omeprazole in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 3*)

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Omeprazole related compounds F and G ^a	0.33	1.6	0.5
5-Methoxy-1 <i>H</i> -benzimidazole-2-thiol	0.64	3.1	0.5
Any other individual impurity	—	1.0	0.5
Total impurities	—	—	2.0

^aThese impurities undergo transformation in the solution to form a conversion product, which elutes at the relative retention time of 0.33.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store between 15° and 30°.

- **LABELING:** When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS** (11)

USP Omeprazole RS

USP Omeprazole Related Compounds F and G Mixture RS

1,3-Dimethyl-8-methoxy-12-thioxopyrido[1',2':3,4]imidazo[1,2-*a*]benzimidazol-2(1*H*)-one and 1,3-dimethyl-9-methoxy-12-thioxopyrido[1',2':3,4]imidazo[1,2-*a*]benzimidazol-2(1*H*)-one.

Omeprazole Oral Suspension**DEFINITION**

Omeprazole Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of omeprazole (C₁₇H₁₉N₃O₃S).

Prepare Omeprazole Oral Suspension 2 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Omeprazole and sodium bicarbonate for oral suspension ^a equivalent to	200 mg and 16.8 g
Purified Water, USP, a sufficient quantity to make	100 mL

^aZegerid 20-mg/1680-mg powder for oral suspension, Santarus, San Diego, CA.

Calculate the required quantity of each ingredient for the total amount to be prepared. Empty the required number of packets in a suitable mortar. Add *Purified Water* in small portions, and triturate to make a smooth paste. Add increasing volumes of *Purified Water* to make an omeprazole liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Purified Water* to bring to final volume, and mix well.

ASSAY• **PROCEDURE**

Solution A: 50 mM monobasic sodium phosphate buffer, adjusted to pH 8.5 with dilute sodium hydroxide
Mobile phase: Acetonitrile and *Solution A* (25:75). Filter and degas.

Standard stock solution: 1.0 mg/mL of USP Omeprazole RS in *Mobile phase*

Standard solution: 50 μg/mL prepared from *Standard stock solution* in *Mobile phase*

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.25 mL of Oral Suspension

sion into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 50 µg/mL of omeprazole. Centrifuge.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 302 nm

Column: 3.9-mm × 15-cm; 4-µm packing L1

Column temperature: 35°

Flow rate: 1.0 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for omeprazole is about 7.8 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of omeprazole (C₁₇H₁₉N₃O₃S) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of omeprazole in the *Standard solution* (µg/mL)

C_U = nominal concentration of omeprazole in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **PH (791):** 7.5–8.5

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled cold temperature.
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 45 days after the date on which it was compounded, when stored at controlled cold temperature
- **USP REFERENCE STANDARDS (11)**
USP Omeprazole RS

Omeprazole Magnesium

C₃₄H₃₆MgN₆O₆S₂ 713.12

(*RS*)-5-Methoxy-2-[[[(4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulfonyl]-1*H*-benzimidazole, magnesium salt (2:1).

5-Methoxy-2-[[[(4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulfonyl]benzimidazole, (*RS*), magnesium salt (2:1) [95382-33-5].

» Omeprazole Magnesium contains not less than 97.5 percent and not more than 102.0 percent of

C₃₄H₃₆MgN₆O₆S₂, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, protected from light. Store at room temperature.

USP Reference standards (11)—

USP Omeprazole RS

USP Omeprazole Magnesium RS

USP Omeprazole Related Compound A RS

Omeprazole sulfone, 5-methoxy-2-[[[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfonyl]-1*H*-benzimidazole.

C₁₇H₁₉N₃O₄S 361.42 [CAS-88546-55-8].

Identification—

A: Infrared Absorption (197K).

B: The *Test solution*, prepared and tested as directed in the test for *Content of magnesium*, exhibits a significant absorption at the magnesium emission line at 285.2 nm.

Color of solution—Prepare a solution of Omeprazole Magnesium in methanol having a concentration of 20 mg per mL, and filter. Determine the absorbance of this solution at 440 nm, in 1-cm cells, using methanol as the blank: the absorbance is no greater than 0.1.

Water Determination, Method I (921): between 7% and 10%.

Specific rotation (781S): between +0.5° and −0.5°, measured at 20°.

Test solution: 10 mg per mL, in methanol.

Chromatographic purity—

Phosphate buffer pH 7.6—Prepare as directed in the *Assay*.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer pH 7.6* and acetonitrile (72.5:27.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—To improve the resolution, the composition may be changed to 75:25, if necessary.]

Test solution—Dissolve about 4 mg of Omeprazole Magnesium in 25 mL of the *Mobile phase*. [NOTE—Prepare this solution fresh.]

System suitability solution—Dissolve about 1 mg of USP Omeprazole RS and 1 mg of USP Omeprazole Related Compound A RS in about 25 mL of *Mobile phase*. [NOTE—Omeprazole related compound A is omeprazole sulfone.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 12.5-cm or 4.6-mm × 15-cm column that contains 5-µm packing L7. (Alternatively, a 3.9-mm × 15-cm column that contains 4-µm packing L1 may be used.) The flow rate is about 0.8 to 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times for omeprazole related compound A and omeprazole are about 0.8 and 1.0, respectively; and the resolution, *R*, between omeprazole related compound A and omeprazole is not less than 3.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram for at least 4.5 times the retention time of omeprazole, and measure the peak responses. Identify the impurities based on the relative retention times listed in *Table 1*.

Table 1

Name	Relative Retention Time	Limit (%)
Omeprazole <i>N</i> -oxide ¹	0.45	0.1
Omeprazole sulfone ² (Omeprazole related compound A)	0.8	0.1
Omeprazole	1.0	—

¹ 4-Methoxy-2-[[[(*RS*)-(5-methoxy-1*H*-benzimidazol-2-yl)sulfinyl]methyl]-3,5-dimethylpyridine 1-oxide

² 5-Methoxy-2-[[[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfonyl]-1*H*-benzimidazole

Calculate the percentage of any individual impurity in the portion of Omeprazole Magnesium taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of any individual impurity; and r_s is the sum of the responses of all the peaks: in addition to not exceeding the limits in Table 1, not more than 0.1% of any other individual impurity is found; and not more than 0.5% of total impurities is found.

Content of magnesium—

Lanthanum solution—Transfer 58.7 g of lanthanum oxide to a 1000-mL volumetric flask, wet the substance with some water, and dissolve by cautious addition of 250 mL of hydrochloric acid in 20- to 30-mL portions, cooling between additions. Add water while stirring, cool to room temperature, and dilute with water to volume. [NOTE—Store the solution in a plastic bottle.]

Magnesium standard stock solution—Quantitatively dilute a suitable amount of a commercially prepared atomic absorption standard solution for magnesium with water to obtain a solution containing 1000 µg of magnesium per mL. [NOTE—Store the solution in a plastic bottle.]

Magnesium intermediate standard solution—Transfer 10.0 mL of Magnesium standard stock solution to a 500-mL volumetric flask, add 50 mL of 1 N hydrochloric acid, and dilute with water to volume. Transfer 20.0 mL of this solution to a 200-mL volumetric flask, and dilute with water to volume. This solution contains 2 µg of magnesium per mL.

Standard solutions—Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of Magnesium intermediate standard solution to separate 100-mL volumetric flasks. To each flask, add 4.0 mL of Lanthanum solution, and dilute with water to volume. These Standard solutions contain 0.1, 0.2, 0.3, 0.4, and 0.5 µg of magnesium per mL, respectively. [NOTE—Concentrations of the Standard solutions and the Test solution may be modified to fit the linear or working range of the instrument. When using instruments with a linear calibration graph, the number of the Standard solutions can be reduced.]

Blank solution—Transfer 4.0 mL of Lanthanum solution to a 100-mL volumetric flask, and dilute with water to volume.

Test solution—Transfer about 250 mg of Omeprazole Magnesium, accurately weighed, to a 100-mL volumetric flask, add 20 mL of 1 N hydrochloric acid, swirl until dissolved, and dilute with water to volume. Allow to stand for 30 minutes. Transfer 10.0 mL of this solution to a 200-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of the solution so obtained to another 100-mL volumetric flask, add 4.0 mL of Lanthanum solution, and dilute with water to volume.

Procedure—Concomitantly determine the absorbances of the Standard solutions, the Blank solution, and the Test solution at the magnesium emission line at 285.2 nm with a suitable atomic absorption spectrophotometer (see Atomic Absorption Spectroscopy (852)) using an air-acetylene flame. Determine the concentration, C , in µg per mL, of magnesium in the Test solution using the calibration graph. Calculate

the content of magnesium, in percentage, in the portion of Omeprazole Magnesium taken by the formula:

$$100(0.001CD / W)[100 / (100 - L)]$$

in which the multiplier 0.001 is for conversion of µg per mL to mg per mL; C is as defined above; D is the dilution factor for the Test solution; W is the quantity of Omeprazole Magnesium, in mg, taken to prepare the Test solution; and L is the content of water, in percentage, as determined in the test for Water. The magnesium content, calculated on the anhydrous basis, is between 3.30% and 3.55%.

Assay—

Phosphate buffer pH 7.6—Dissolve 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 300 mL of water, dilute with water to 1000 mL, and mix. Dilute 250 mL of this solution with water to 1000 mL. If necessary, adjust with phosphoric acid to a pH of 7.6.

Mobile phase—Prepare a mixture of Phosphate buffer pH 7.6 and acetonitrile (650:350).

Phosphate buffer pH 11—Mix 11 mL of 0.25 M tribasic sodium phosphate with 22 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 100 mL.

Standard preparation—Transfer about 10 mg of USP Omeprazole RS, accurately weighed, to a 200-mL volumetric flask, and dissolve in about 10 mL of methanol. Add 10 mL of Phosphate buffer pH 11, and dilute with water to volume. This solution contains about 0.05 mg of omeprazole per mL.

Assay preparation—Transfer about 10 mg of Omeprazole Magnesium, accurately weighed, to a 200-mL volumetric flask, dissolve in about 10 mL of methanol, add 10 mL of Phosphate buffer pH 11, and dilute with water to volume. This solution contains about 0.05 mg of omeprazole magnesium per mL.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 12.5-cm or 4.6-mm × 15-cm column that contains 5-µm packing L7. (Alternatively, a 3.9-mm × 15-cm column that contains 4-µm packing L1 may be used.) The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{34}H_{36}MgN_6O_6S_2$ in the portion of Omeprazole Magnesium taken by the formula:

$$100[(713.12 / (2 \times 345.42))(C_s / C_u)(r_u / r_s)]$$

in which 713.12 and 345.42 are the molecular weights of omeprazole magnesium and omeprazole, respectively; C_s is the concentration, in mg per mL, of omeprazole in the Standard preparation; C_u is the concentration, in mg per mL, of omeprazole magnesium in the Assay preparation; and r_u and r_s are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Ondansetron

$C_{18}H_{19}N_3O$ 293.36

4*H*-Carbazol-4-one, 1,2,3,9-tetrahydro-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]- (±)-
(±)-2,3-Dihydro-9-methyl-3-[(2-methylimidazol-1-yl)methyl]carbazol-4(1*H*)-one [99614-02-5].

» Ondansetron contains not less than 98.0 percent and not more than 102.0 percent of $C_{18}H_{19}N_3O$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers at room temperature.

USP Reference standards (11)—

USP Ondansetron RS

USP Ondansetron Related Compound C RS

1,2,3,9-Tetrahydro-9-methyl-4*H*-carbazol-4-one.

USP Ondansetron Related Compound D RS

1,2,3,9-Tetrahydro-9-methyl-3-methylene-4*H*-carbazol-4-one.

Identification—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Water Determination, Method 1a (921): not more than 3.0%.

Residue on ignition (281): not more than 0.1%.

Chloride (221)—To 1 g of the substance under test, add 30 to 40 mL of water, and warm gently, if necessary, until no more dissolves. Mix well, and pass through a filter paper that gives a negative test for chloride. Add 1 mL of nitric acid and 1 mL of silver nitrate TS. Dilute with water to 50 mL. Mix well, and allow to stand for 5 minutes protected from direct sunlight: any turbidity formed is not greater than that produced in a similarly treated control solution containing 0.3 mL of 0.020 N hydrochloric acid (0.02%).

Limit of ondansetron related compound D—

Phosphate buffer—Dissolve about 2.72 g of monobasic potassium phosphate in 900 mL of water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide to a pH of 5.4, dilute to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Dissolve an amount of USP Ondansetron Related Compound D RS in *Mobile phase*, and dilute stepwise with *Mobile phase*, to obtain a solution having a known concentration of about 0.4 µg per mL.

Resolution solution—Prepare a solution of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in *Mobile phase* having a known concentration of about 0.6 µg per mL and 1.0 µg per mL, respectively.

Test solution—Transfer about 50 mg of Ondansetron, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 328-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The column temperature is maintained at 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for ondansetron related compound C and 1.0 for ondansetron related compound D; and the resolution, *R*, between ondansetron related compound C and ondansetron related compound D is not less than 1.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 8000 theoretical plates;

and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the ondansetron taken by the formula:

$$10(C/W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Ondansetron Related Compound D RS in the *Standard solution*; *W* is the weight, in mg, of ondansetron taken to prepare the *Test solution*; and *r_U* and *r_S* are the peak responses of ondansetron related compound D obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.10% is found.

Related compounds—

Phosphate buffer, **Mobile phase**, **Resolution solution**, **Standard preparation**, and **Chromatographic system**—Prepare as directed in the *Assay*.

Test solution—Use the *Assay preparation* prepared as directed in the *Assay*.

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Ondansetron taken by the formula:

$$100(r_i / r_s)$$

in which *r_i* is the peak area for each impurity; and *r_s* is the sum of the areas of all the peaks: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found, including ondansetron related compound D. [NOTE—Disregard the peak corresponding to ondansetron related compound D at a relative retention time of about 0.4.]

Assay—

Phosphate buffer—Dissolve about 2.72 g of monobasic potassium phosphate in 900 mL of water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide to a pH of 5.4, dilute to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (52:48). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Prepare a solution of USP Ondansetron RS and USP Ondansetron Related Compound A RS in *Mobile phase* having a known concentration of about 0.09 mg per mL and 0.05 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.090 mg per mL.

Assay preparation—Transfer about 45 mg of Ondansetron, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.1 for ondansetron related compound A and 1.0 for ondansetron; and the resolution, *R*, between ondansetron related compound A and ondansetron is not less than 1.5. Chromatograph the

Standard preparation, and record the peak responses as directed for **Procedure**: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the **Standard preparation** and the **Assay preparation** into the chromatograph, record the chromatograms, and measure the responses for the ondansetron peaks. Calculate the quantity, in mg, of $C_{18}H_{19}N_3O$ in the portion of Ondansetron taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ondansetron RS in the **Standard preparation**; and r_U and r_S are the peak responses obtained from the **Assay preparation** and the **Standard preparation**, respectively.

Ondansetron Hydrochloride

$C_{18}H_{19}N_3O \cdot HCl \cdot 2H_2O$ 365.85

4*H*-Carbazol-4-one, 1,2,3,9-tetrahydro-9-methyl-3-(2-methyl-1*H*-imidazol-1-yl)methyl-, monohydrochloride, (\pm)-, dihydrate.

(\pm)-2,3-Dihydro-9-methyl-3-(2-methylimidazol-1-yl)methylcarbazol-4(1*H*)-one monohydrochloride dihydrate [103639-04-9].

» Ondansetron Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{18}H_{19}N_3O \cdot HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Ondansetron Hydrochloride RS

USP Ondansetron Related Compound A RS

3[(Dimethylamino)methyl]-1,2,3,9-tetrahydro-9-methyl-4*H*-carbazol-4-one.

USP Ondansetron Resolution Mixture RS

Ondansetron hydrochloride having approximately 0.4% w/w of both ondansetron related compound A and 6,6'-methylene bis-[(1,2,3,9-tetrahydro-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)-methyl]-4*H*-carbazol-4-one)].

USP Ondansetron Related Compound C RS

1,2,3,9-Tetrahydro-9-methyl-4*H*-carbazol-4-one.

USP Ondansetron Related Compound D RS

Identification—

A: **Infrared Absorption** (197M).

B: Dissolve 20 mg in 2 mL of water, add 1 mL of 2 M nitric acid, and filter: the filtrate responds to the test for Chloride (191).

Water Determination, *Method Ia* (921): between 9.0% and 10.5%.

Residue on ignition (281): not more than 0.1%.

Limit of ondansetron related compound D—

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M monobasic potassium phosphate (previously ad-

justed with 1 M sodium hydroxide to a pH of 5.4) and acetonitrile (80:20). Make adjustments if necessary (see **System Suitability** under **Chromatography** (621)).

Standard solution—Dissolve an accurately weighed quantity of USP Ondansetron Related Compound D RS in **Mobile phase**, and dilute quantitatively, and stepwise if necessary, with **Mobile phase** to obtain a solution having a known concentration of about 0.4 μ g per mL.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in **Mobile phase**, and dilute quantitatively, and stepwise if necessary, with **Mobile phase** to obtain a solution having a concentration of about 0.6 μ g per mL and 1 μ g per mL, respectively.

Test solution—Transfer about 50 mg of Ondansetron Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with **Mobile phase** to volume, and mix.

Chromatographic system (see **Chromatography** (621))—The liquid chromatograph is equipped with a 328-nm detector and a 4.6-mm \times 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the **System suitability solution**, and record the peak responses as directed for **Procedure**: the relative retention times are about 0.8 for ondansetron related compound C and 1.0 for ondansetron related compound D; and the resolution, R , between ondansetron related compound C and ondansetron related compound D is not less than 1.5. Chromatograph the **Standard solution**, and record the peak responses as directed for **Procedure**: the column efficiency determined from the analyte peak is not less than 400 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the **Standard solution** and the **Test solution** into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the portion of Ondansetron Hydrochloride taken by the formula:

$$10,000(C/W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ondansetron Related Compound D RS in the **Standard solution**; W is the weight, in mg, of Ondansetron Hydrochloride taken to prepare the **Test solution**; and r_U and r_S are the peak areas obtained from the **Test solution** and the **Standard solution**, respectively: not more than 0.10% is found.

Chromatographic purity—

METHOD I—

Resolution solution—Dissolve a quantity of USP Ondansetron Resolution Mixture RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of 12.5 mg per mL.

Standard solutions—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in methanol, and mix to obtain a solution having a known concentration of about 0.25 mg per mL. Quantitatively dilute this solution with methanol to obtain **Standard solutions**, designated below by letter, having the following compositions:

Standard solution	Dilution	Concentration (μ g RS per mL)	Percentage (% for comparison with test specimen)
A	(1 in 5)	50	0.4
B	(1 in 10)	25	0.2
C	(1 in 20)	12.5	0.1

Test solution—Dissolve an accurately weighed quantity of Ondansetron Hydrochloride in methanol to obtain a solution containing 12.5 mg per mL.

Procedure—Separately apply 20 μ L of the *Test solution*, 20 μ L of each *Standard solution*, and 20 μ L of the *Resolution solution* to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of chloroform, ethyl acetate, methanol, and ammonium hydroxide (90:50:40:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light: complete resolution of the three components of the *Resolution solution* spot is found. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*: any secondary spot from the chromatogram of the *Test solution* having an R_f value corresponding to that of the uppermost secondary spot of the *Resolution solution* is not larger or more intense than the principal spot obtained from *Standard solution A* (0.4%); and no other secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution B* (0.2%).

METHOD II—

Mobile phase and Chromatographic system—Proceed as directed in the *Assay*.

Standard solution—Proceed as directed for *Standard preparation* in the *Assay*.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Ondansetron Hydrochloride taken by the formula:

$$50,000(C/W)(1/F)(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP Ondansetron Hydrochloride RS in the *Standard solution*; W is the weight, in mg, of Ondansetron Hydrochloride taken to prepare the *Test solution*; F is the relative response factor of the impurities as described in the accompanying table; r_i is the peak area for each impurity in the *Test solution*; and r_s is the peak area of ondansetron obtained from the *Standard solution*: it meets the requirements given in the accompanying table.

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
Ondansetron related compound C	about 0.32	1.2	0.2
Ondansetron related compound D*	about 0.34	—	0.1
Imidazole	about 0.49	0.3	0.2
2-methylimidazole	about 0.54	0.4	0.2
Ondansetron	1.0	—	—
Ondansetron related compound A	about 1.10	0.8	0.2
Unknown	—	1.0	0.1
Total	—	—	0.5

*Quantified in the test for Limit of ondansetron related compound D.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M monobasic sodium phosphate (previously adjusted

with 1 M sodium hydroxide to a pH of 5.4) and acetonitrile (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 90 μ g per mL.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Hydrochloride RS and USP Ondansetron Related Compound A RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 90 μ g per mL and 20 μ g per mL, respectively.

Assay preparation—Transfer about 45 mg of Ondansetron Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm \times 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for ondansetron and 1.1 for ondansetron related compound A; and the resolution, R , between ondansetron related compound A and ondansetron is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{18}H_{19}N_3O \cdot HCl$ in the portion of Ondansetron Hydrochloride taken by the formula:

$$500C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Ondansetron Hydrochloride RS in the *Standard preparation*; and r_u and r_s are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ondansetron Compounded Oral Suspension

DEFINITION

Ondansetron Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of ondansetron ($C_{18}H_{19}N_3O$), calculated on the anhydrous basis.

Prepare Ondansetron Compounded Oral Suspension containing 1.0 mg/mL of ondansetron hydrochloride (dihydrate) equivalent to 0.8 mg/mL of ondansetron as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Ondansetron (as ondansetron hydrochloride dihydrate)	80 mg (100 mg)
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Place the required number of tablets in a suitable glass mortar, and comminute to a fine powder, or add Ondansetron hydrochloride powder. Add 50 mL of the *Vehicle* in 5-mL

portions, and mix well with each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to bring the preparation to final volume, and mix well.

ASSAY

• PROCEDURE

Mobile phase: 43 mM of monobasic potassium phosphate buffer adjusted with a mixture of 1 N sodium hydroxide and acetonitrile (85:15) to a pH of 5.4

Standard solution: Dissolve USP Ondansetron Hydrochloride RS in *Mobile phase* to obtain a solution with a nominal concentration of 4 µg/mL of ondansetron.

Sample solution: Bring each bottle of Oral Suspension to room temperature. Pipet 500 µL of Oral Suspension from each bottle into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass through a filter of 0.45-µm pore size, and keep frozen at -70° until assayed.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 216 nm

Columns

Guard: 3.9-mm × 20-cm; 4-µm packing L10

Analytical: 4.6-mm × 25-cm; 5-µm packing L10

Flow rate: 1 mL/min

Injection volume: 80 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for ondansetron is about 30 min.]

Suitability requirements

Relative standard deviation: NMT 1.6% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ondansetron (C₁₈H₁₉N₃O) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of ondansetron in the *Standard solution* (µg/mL)

C_U = nominal concentration of ondansetron in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0% on the anhydrous basis

SPECIFIC TESTS

- **pH** <791>: 3.6–4.6

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a refrigerator.
- **BEYOND-USE DATE:** NMT 42 days after the date on which it was compounded when stored at controlled room temperature or in a refrigerator
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*. Label to indicate that it contains 0.8 mg/mL of ondansetron equivalent to 1 mg/mL of ondansetron hydrochloride (dihydrate).

• USP REFERENCE STANDARDS <11>

USP Ondansetron Hydrochloride RS

Ondansetron Injection

» Ondansetron Injection is a sterile solution of Ondansetron Hydrochloride in Water for Injection or of Ondansetron in Water for Injection prepared with the aid of Hydrochloric Acid. It may contain suitable buffers and/or tonicity adjusting agents. It contains an amount of Ondansetron Hydrochloride equivalent to not less than 95.0 percent and not more than 105.0 percent of the labeled amount of ondansetron (C₁₈H₁₉N₃O).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, at a temperature between 2° and 30°, protected from light.

USP Reference standards <11>—

USP Endotoxin RS

USP Ondansetron Hydrochloride RS

USP Ondansetron Related Compound A RS

3[(Dimethylamino)methyl]-1,2,3,9-tetrahydro-9-methyl-4H-carbazol-4-one.

USP Ondansetron Related Compound C RS

1,2,3,9-Tetrahydro-9-methyl-4H-carbazol-4-one.

USP Ondansetron Related Compound D RS

1,2,3,9-Tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one.

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test <85>—It contains not more than 9.9 USP Endotoxin Units per mg of ondansetron hydrochloride.

pH <791>: between 3.3 and 4.0.

Particulate Matter in Injections <788>: meets the requirements for small-volume injections.

Limit of ondansetron related compound D—

Mobile phase, Standard solution, System suitability solution, and Chromatographic system—Proceed as directed in the test for *Limit of ondansetron related compound D* under *Ondansetron Hydrochloride*.

Test solution—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of ondansetron, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of ondansetron related compound D in the volume of Injection taken by the formula:

$$(2.5 / V)(C_S / C_A)(r_U / r_S)$$

in which V is the volume, in mL, of Injection taken; C_S is the concentration, in µg per mL, of ondansetron related compound D in the *Standard preparation*; C_A is the concentration, in mg per mL, of ondansetron in the Injection, as determined in the *Assay*; and r_U and r_S are the peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 0.12% is found.

Chromatographic purity—

Mobile phase and Chromatographic system—Proceed as directed in the *Assay*.

System suitability solution—Use the *System suitability solution* prepared as directed in the test for *Limit of ondansetron related compound D* under *Ondansetron Hydrochloride*.

Test solution—Use the *Assay preparation*.

Procedure—Inject about 20 μ L of the *System suitability solution*, record the chromatogram, and identify the peaks due to ondansetron related compound C and ondansetron related compound D based on their approximate relative retention times of 0.35 and 0.37, respectively. Inject a volume (about 10 μ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. [NOTE—Ignore the peak due to ondansetron related compound D.] Calculate the percentage of each impurity in the volume of Injection taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses of all of the peaks: not more than 0.2% of any individual impurity is found, and the total of all impurities, including the percentage of ondansetron related compound D determined in the test for *Limit of ondansetron related compound D*, is not more than 0.5%.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 0.02 M monobasic potassium phosphate (previously adjusted with 1 M sodium hydroxide to a pH of 5.4), and acetonitrile (50:50). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Ondansetron Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Hydrochloride RS and USP Ondansetron Related Compound A RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.1 mg per mL and 50 μ g per mL, respectively.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 2 mg of ondansetron, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm \times 20-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for ondansetron and 1.1 for ondansetron related compound A; and the resolution, R , between ondansetron related compound A and ondansetron is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ondansetron ($C_{18}H_{19}N_3O$) in each mL of the Injection taken by the formula:

$$(293.36 / 329.83)(25C / V)(r_U / r_S)$$

in which 293.36 and 329.83 are the molecular weights of ondansetron and anhydrous ondansetron hydrochloride, respectively; C is the concentration, in mg per mL, on the anhydrous basis, of USP Ondansetron Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Injection

taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ondansetron Oral Solution

» Ondansetron Oral Solution is a solution of Ondansetron Hydrochloride in a suitable vehicle. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of ondansetron ($C_{18}H_{19}N_3O$).

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Ondansetron Hydrochloride RS

USP Ondansetron Related Compound A RS

3[(Dimethylamino)methyl]-1,2,3,9-tetrahydro-9-methyl-4H-carbazol-4-one.

USP Ondansetron Related Compound C RS

1,2,3,9-Tetrahydro-9-methyl-4H-carbazol-4-one.

USP Ondansetron Related Compound D RS

1,2,3,9-Tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one.

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

Test solution—Dilute a portion of Oral Solution with a mixture of methanol and water (50:50) to obtain a solution containing about 0.2 mg of ondansetron per mL.

Standard solution: 0.25 mg per mL in methanol.

Developing solvent system: chloroform, ethyl acetate, methanol, and ammonium hydroxide (90:50:40:1).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Escherichia coli*. The total aerobic microbial count does not exceed 100 cfu per g, the *Enterobacteriaceae* count does not exceed 10 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

Deliverable volume (698): meets the requirements.

pH (791): between 3.3 and 4.0.

Limit of ondansetron related compound D—

Mobile phase—Proceed as directed in the test for *Limit of ondansetron related compound D* under *Ondansetron Hydrochloride*.

System suitability solution—Dissolve suitable quantities of USP Ondansetron Related Compound D RS and USP Ondansetron Related Compound C RS in *Mobile phase*; and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.5 μ g per mL and 2 μ g per mL, respectively.

Standard solution—Dissolve an accurately weighed quantity of USP Ondansetron Related Compound D RS in *Mobile phase*; and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.5 μ g per mL.

Test solution—Quantitatively dilute, if necessary, an accurately measured volume of Oral Solution with *Mobile phase* to obtain a solution containing about 0.8 mg of ondansetron per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 328-nm detector and a 4.6-mm \times 25-cm column that contains packing L10.

The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between ondansetron related compound D and ondansetron related compound C is not less than 2.0; the tailing factor for ondansetron related compound D is not more than 2.0; and the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ondansetron related compound D in the volume of Oral Solution taken by the formula:

$$100D(C_S / C_A)(r_U / r_S)$$

in which *D* is the dilution factor for the Oral Solution in the *Test solution*; *C_S* is the concentration, in μ g per mL, of USP Ondansetron Related Compound D RS in the *Standard solution*; *C_A* is the concentration, in μ g per mL, of ondansetron in the Oral Solution, as determined in the *Assay*; and *r_U* and *r_S* are the peak responses of ondansetron related compound D obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.

Related compounds—

Mobile phase, System suitability solution, and Chromatographic system—Proceed as directed in the *Assay* under *Ondansetron Hydrochloride*.

Standard solution—Prepare as directed for the *Standard preparation*, in the *Assay* under *Ondansetron Hydrochloride*.

Test solution—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound in the volume of Oral Solution taken by the formula:

$$(293.36 / 329.83)10,000(1 / F)(1 / V)(C_S / C_A)(r_i / r_S)$$

in which 293.36 and 329.83 are the molecular weights of ondansetron and anhydrous ondansetron hydrochloride, respectively; *F* is the relative response factor for each known and unknown impurity (the values of relative response factors [RRF] and the limits can be obtained from Table 1); *V* is the volume, in mL, of Oral Solution taken; *C_S* is the concentration, in mg per mL, on the anhydrous basis, of USP Ondansetron Hydrochloride RS in the *Standard solution*; *C_A* is the concentration, in mg per mL, of ondansetron in the Oral Solution; *r_i* is the peak response for any related compound obtained from the *Test solution*; and *r_S* is the peak response for ondansetron obtained from the *Standard solution*.

Table 1

Related Compound	Approx. RRT	RRF	Limit (%)
Ondansetron related compound D*	0.34	—	0.1
Imidazole	0.40	0.46	0.2
2-Methyl imidazole	0.53	0.54	0.2
Des-C-methyl ondansetron hydrochloride	0.62	0.76	0.2
N-Desmethyl ondansetron maleate	0.83	0.73	0.2
Ondansetron related compound A	1.2	0.81	0.2
Unknown		1.0	0.2
Total (including ondansetron related compound D)		—	0.5

*Quantified from Limit of related compound D test

Assay—

Mobile phase, System suitability solution, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Ondansetron Hydrochloride*.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 9 mg of ondansetron, to a 100-mL volumetric flask; dilute with *Mobile phase* to volume; and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 216-nm detector and a 4.6-mm \times 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.1 for ondansetron related compound A and 1.0 for ondansetron; and the resolution, *R*, between ondansetron related compound A and ondansetron is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ondansetron ($C_{18}H_{19}N_3O$) in each mL of Oral Solution taken by the formula:

$$(293.36 / 329.83)100(C / V)(r_U / r_S)$$

in which 293.36 and 329.83 are the molecular weights of ondansetron and anhydrous ondansetron hydrochloride, respectively; *C* is the concentration, in mg per mL, on the anhydrous basis, of USP Ondansetron Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Oral Solution taken; and *r_U* and *r_S* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ondansetron Tablets

DEFINITION

Ondansetron Tablets contain Ondansetron Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ondansetron ($C_{18}H_{19}N_3O$).

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

Sample: Transfer a portion of the powder from finely powdered Tablets, equivalent to 100 mg of ondansetron hydrochloride, to a suitable conical flask. Add 50 mL of alcohol, and swirl. Pass the liquid through a PTFE filter of 0.45- μ m pore size into a 50-mL beaker. Evaporate the solvent on a rotary evaporator. Dry the precipitate in an air oven for 1 h at 105°. Prepare a suitable dispersion of the residue in potassium bromide, and record the spectra of the *Sample* and the standard specimen in the spectral range 3800–650 cm^{-1} . [NOTE—It is recommended that a solution of USP Ondansetron Hydrochloride RS in alcohol be prepared at a concentration of 2 mg/mL before the evaporation, followed by the drying steps.]

Acceptance criteria: The *Sample* shows strong bands at 1621, 1481, 1281, and 758 cm^{-1} , similar to the potassium bromide dispersion of USP Ondansetron Hydrochloride RS.

- B.** The retention time of the major peak of the *Sample* solution corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Buffer: 2.7 g/L of monobasic potassium phosphate. Adjust with 1 N sodium hydroxide to a pH of 5.4.

Mobile phase: Acetonitrile and Buffer (1:4)

Diluent: Acetonitrile and Buffer (1:1)

Standard solution: 0.05 mg/mL of ondansetron (free base) in Diluent from USP Ondansetron Hydrochloride RS

Sample stock solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 50 mg of ondansetron, based on the label claim, to a 100-mL volumetric flask. Add 70 mL of Diluent, and sonicate for about 20 min. Dilute with Diluent to volume. Centrifuge a portion of the solution.

Sample solution: Quantitatively dilute the supernatant with Diluent to obtain a solution having a nominal concentration of 0.05 mg/mL of ondansetron, based on the label claim. Pass through a suitable nylon filter of 0.45-μm pore size, and use the filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 216 nm

Column: 4.6-mm × 25-cm; 5-μm packing L10

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the label claim of ondansetron ($C_{18}H_{19}N_3O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of ondansetron (free base) in the Standard solution (mg/mL)

C_U = nominal concentration of ondansetron in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**• DISSOLUTION (711)****Test 1**

Medium: Water; 500 mL, deaerated

Apparatus 2: 50 rpm

Time: 15 min

Standard solution: USP Ondansetron Hydrochloride RS in Medium in a concentration similar to the one expected in the Sample solution

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size, and dilute, if necessary, with Medium.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV

Analytical wavelength: 310 nm

Blank: Medium

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of ondansetron ($C_{18}H_{19}N_3O$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of the Standard solution (mg/mL)

L = label claim (mg/Tablet)

M_{r1} = molecular weight of ondansetron, 293.36

M_{r2} = molecular weight of ondansetron hydrochloride (anhydrous), 329.83

V = volume of Medium, 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of $C_{18}H_{19}N_3O$ is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium, Apparatus 2, Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed for Test 1.

Time: 30 min

Tolerances: NLT 80% (Q) of the labeled amount of $C_{18}H_{19}N_3O$ is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 3.

Medium: 0.01 N hydrochloric acid; 500 mL, deaerated

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: Known concentration of USP Ondansetron Hydrochloride RS in Medium, close to the expected concentration of the Sample solution

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size, and dilute, if necessary, with Medium.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV

Analytical wavelength: 248 nm

Blank: Medium

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of ondansetron ($C_{18}H_{19}N_3O$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of the Standard solution (mg/mL)

L = label claim (mg/Tablet)

M_{r1} = molecular weight of ondansetron, 293.36

M_{r2} = molecular weight of ondansetron hydrochloride (anhydrous), 329.83

V = volume of Medium, 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of $C_{18}H_{19}N_3O$ is dissolved.

Test 4: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 4.

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard stock solution: 450 μg/mL of USP Ondansetron Hydrochloride RS in Medium

Standard solution: Dilute the Standard stock solution quantitatively and stepwise, if necessary, with Medium to obtain a final concentration of about (L/500) mg/mL, where L is the Tablet label claim, in mg.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV

Analytical wavelength: 249 nm

Cell path: 1 cm for Tablets labeled to contain 4 or 8 mg; 0.2 cm for Tablets labeled to contain 16 or 24 mg

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of ondansetron ($C_{18}H_{19}N_3O$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

M_{r1} = molecular weight of ondansetron, 293.36

M_{r2} = molecular weight of ondansetron hydrochloride (anhydrous), 329.83

V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of ondansetron is dissolved.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium, Apparatus 2, Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed for *Test 1*.

Time: 30 min

Tolerances: NLT 70% (Q) of the labeled amount of ondansetron is dissolved.

Test 6: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium: Water; 500 mL, deaerated

Apparatus 2: 50 rpm

Time: 30 min

Buffer: 3.12 g/L of monobasic sodium phosphate dihydrate. Adjust with 1 N sodium hydroxide to a pH of 5.4.

Mobile phase: Acetonitrile and *Buffer* (40:60)

Standard solution

For Tablets labeled to contain 4 or 24 mg: 0.01 mg/mL of USP Ondansetron Hydrochloride RS in *Medium*

For Tablets labeled to contain 8 mg: 0.02 mg/mL of USP Ondansetron Hydrochloride RS in *Medium*

Sample solution

For Tablets labeled to contain 4 or 8 mg: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

For Tablets labeled to contain 24 mg: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size. Further dilute 4.0 mL of this solution with *Medium* to 25.0 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 216 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L10

Flow rate: 2.0 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of ondansetron ($C_{18}H_{19}N_3O$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times D \times 100$$

r_U = peak response of the *Sample solution*

r_S = peak response of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

M_{r1} = molecular weight of ondansetron, 293.36

M_{r2} = molecular weight of ondansetron hydrochloride (anhydrous), 329.83

V = volume of *Medium*, 500 mL

D = dilution factor of the *Sample solution*

Tolerances: NLT 75% (Q) of the labeled amount of ondansetron is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer and Mobile phase: Proceed as directed in the *Assay*.

System suitability solution: 0.05 and 0.1 mg/mL of USP Ondansetron Related Compound A RS and USP Ondansetron Hydrochloride RS, respectively, in *Mobile phase*

Standard stock solution: Use the *Standard solution* in the *Assay*.

Standard solution: 1.5 μ g/mL of ondansetron in *Mobile phase* from the *Standard stock solution*

Sample solution: Weigh and crush NLT 20 Tablets.

Transfer a quantity of powder, equivalent to 50 mg of ondansetron, to a 100-mL volumetric flask. Add about 70 mL of *Mobile phase*, and sonicate for about 20 min. Dilute with *Mobile phase* to volume. Centrifuge the solution. Pass a portion of the solution through a suitable nylon filter of 0.45- μ m pore size, and use the filtrate.

Chromatographic system: Proceed as directed in the *Assay*.

Run time: At least 45 min for the *Sample solution*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between ondansetron related compound A and ondansetron, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of ondansetron from the *Standard solution*

C_S = concentration of ondansetron (free base) in the *Standard solution* (mg/mL)

C_U = nominal concentration of ondansetron in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Ondansetron Orally Disintegrating Tablets

DEFINITION

Ondansetron Orally Disintegrating Tablets contain the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of ondansetron (C₁₈H₁₉N₃O).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Diluent: 0.01 N hydrochloric acid

Buffer: 2.72 g/L of monobasic potassium phosphate in water. Adjust with 1 N sodium hydroxide or 0.5 N sodium hydroxide to a pH of 5.4.

Mobile phase: Acetonitrile and *Buffer* (48:52)

Standard solution: 40 µg/mL of USP Ondansetron RS in *Diluent*

System suitability solution: 0.02 mg/mL of USP Ondansetron Related Compound A RS and 0.006 mg/mL of USP Ondansetron RS in *Diluent*

Sample stock solution: Equivalent to 400 µg/mL of ondansetron. Transfer 10 Tablets to a suitable volumetric flask. Add *Diluent* to fill about 60% of the flask capacity. Shake by mechanical means for about 5 min, and dilute with *Diluent* to volume. Filter a portion of this solution through a polypropylene membrane of 0.45-µm pore size, discarding the first 5 mL of the filtrate.

Sample solution: 40 µg/mL of ondansetron in *Diluent*, from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 216 nm

Column: 4.6-mm × 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ondansetron and ondansetron related compound A are 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 1.5 between ondansetron related compound A and ondansetron, *System suitability solution*

Tailing factor: NMT 2.0 for the ondansetron peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ondansetron (C₁₈H₁₉N₃O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Ondansetron RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ondansetron in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISINTEGRATION (701):** NMT 10 s

- **DISSOLUTION (711)**

Medium: 0.1 N hydrochloric acid; 500 mL, deaerated

Apparatus 2: 50 rpm

Time: 10 min

Detector: UV 310 nm

Cell: 1 cm for 4-mg and 8-mg Tablets; 0.5 cm for 16-mg Tablets; 0.2 cm for 24-mg Tablets

Standard solution: (L/500) mg/mL of USP Ondansetron RS in *Medium*, where L is the label claim in mg

Sample solution: Pass a portion of the solution under test through a suitable filter.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ondansetron released:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Ondansetron RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 500 mL

Tolerances: NLT 80% (Q) of the labeled amount of C₁₈H₁₉N₃O is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Buffer: Prepare as directed in the *Assay*.

Mobile phase: Acetonitrile and *Buffer* (1:4)

Standard solution: 2 µg/mL of USP Ondansetron RS in *Mobile phase*

System suitability solution: 2 µg/mL each of USP Ondansetron Related Compound D RS, 2-methylimidazole, and USP Ondansetron RS in *Mobile phase*. [NOTE—First dissolve in acetonitrile, then dilute with *Mobile phase* to volume.]

System sensitivity solution: 0.2 µg/mL of USP Ondansetron RS, from the *Standard solution* in *Mobile phase*

Sample solution: Equivalent to 400 µg/mL of ondansetron. Transfer 10 Tablets to a suitable volumetric flask. Add *Mobile phase* to fill about 60% of the flask capacity. Shake by mechanical means for about 5 min, and dilute with *Mobile phase* to volume. Centrifuge a portion of this solution at 3000 rpm for 10 min. Use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 216 nm

Column: 4.6-mm × 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution*, *System suitability solution*, and *System sensitivity solution*

Suitability requirements

Resolution: NLT 1.5 between ondansetron and any adjacent peak, *System suitability solution*

Column efficiency: NLT 8000 theoretical plates for ondansetron, *System suitability solution*

Tailing factor: NMT 2.0 for the ondansetron peak, *System suitability solution*

Signal-to-noise ratio: NLT 15, *System sensitivity solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak area of any impurity in the *Sample solution*

r_s = peak area of ondansetron from the *Standard solution*

C_s = concentration of USP Ondansetron RS in the *Standard solution* (µg/mL)

C_u = nominal concentration of the *Sample solution* (µg/mL)

F = relative response factor for each impurity (see *Table 1*)

Acceptance criteria: See *Table 1*.

[NOTE—The run time is about 60 min.]

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
2-Methylimidazole	0.16	0.5	0.2
Ondansetron related compound D	0.45	1.2	0.12
Ondansetron	1.0	—	—
Individual unknown impurity	—	1.0	0.2
Total impurities	—	—	0.5

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant containers. Store at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Ondansetron RS

USP Ondansetron Related Compound A RS

3[(Dimethylamino)methyl]-1,2,3,9-tetrahydro-9-methyl-4H-carbazol-4-one.

USP Ondansetron Related Compound D RS

1,2,3,9-Tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one.

Bland Lubricating Ophthalmic Ointment

DEFINITION

Bland Lubricating Ophthalmic Ointment is a sterile ointment of white petrolatum and mineral oil. It may contain Lanolin, Modified Lanolin, or Lanolin Alcohols. It may also contain a suitable antimicrobial preservative.

SPECIFIC TESTS

• APPEARANCE

Analysis: Transfer a portion of it to a suitable test tube, and examine the sample in front of a light source.

Acceptance criteria: The sample appears translucent.

• STERILITY TESTS (71):

Meets the requirements

• ACIDITY OR ALKALINITY

Sample solution: Transfer 20.0 g of Ophthalmic Ointment to a 400-mL beaker. Add 100 mL of a mixture of neutralized alcohol and water (1 in 2), agitate thoroughly, and gradually heat to boiling. Boil for 10 min.

Analysis: To the *Sample solution* add 1 mL of phenolphthalein TS, and rapidly titrate with vigorous agitation with either 0.1 N sodium hydroxide VS (from a colorless alcohol-water layer to a sharp pink endpoint) or 0.1 N hydrochloric acid VS (from a pink alcohol-water layer to a colorless endpoint).

Acceptance criteria: NMT 0.40 mL of 0.1 N hydrochloric acid VS or 0.1 N sodium hydroxide VS is required to produce the color change.

• COLOR

Analysis: Examine the extruded Ophthalmic Ointment for color.

Acceptance criteria: Colorless to light yellow

• OTHER REQUIREMENTS:

It meets the requirements in *Ophthalmic Products—Quality Tests* (771).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in suitable collapsible ophthalmic ointment tubes.

Opium

» Opium is the air-dried milky exudate obtained by incising the unripe capsules of *Papaver somniferum* L. or its variety *album* De Candolle (Fam. Papaveraceae). It yields not less than 9.5 percent of anhydrous morphine.

Botanic characteristics—More or less rounded, oval, brick-shaped or elongated, somewhat flattened masses usually about 8 cm to 15 cm in diameter and weighing about 300 g to 2 kg each. Externally, it is pale olive-brown or olive-gray, having a coarse surface and being covered with a thin coating consisting of fragments of poppy leaves and, at times, with fruits of a species of *Rumex* adhering from the packing; it is more or less plastic when fresh, becoming hard or tough on storage. Internally, it is reddish brown and coarsely granular.

Assay—

Chromatographic tubes, Citrate buffer, and Standard preparation—Prepare as directed in the Assay under *Paregoric*.

Assay preparation—Transfer about 2 g of Opium, accurately weighed, to a 250-mL beaker, add 20 mL of dimethyl sulfoxide, and heat for 20 minutes on a steam bath, intermittently dispersing the substance with a flat-end stirring rod. Allow to stand for 15 minutes to permit undissolved material to settle, and carefully decant the supernatant into a 100-mL volumetric flask. Add another 20 mL of dimethyl sulfoxide to the residue, rinsing the sides of the beaker with dimethyl sulfoxide. Disperse and heat the substance as before, allow to settle, and decant into the volumetric flask. Repeat the dissolution one or two times, until the opium is dissolved (other than for small leaf fragments, sand-like particles, gelatinous materials, etc.). Rinse the beaker, and transfer the residue to the flask with the aid of water. Dilute with water to about 90 mL, and mix. If necessary, add 1 drop of alcohol to dispel any foam. Cool to room temperature, adjust with water to volume, and mix. Pass the resulting solution through a medium-porosity filter paper, discarding the first 20 mL of the filtrate.

Chromatographic columns—Pack a pledget of glass wool at the base of each of the three tubes, and fill with adsorbent using chromatographic siliceous earth as the base of the adsorbent, and tamping it firmly in place. Prepare the tubes as follows. Pack *Column I* in two layers, the lower layer consisting of 3 g of chromatographic siliceous earth mixed with 2 mL of *Citrate buffer* and the upper layer consisting of 3 g of chromatographic siliceous earth mixed with 2.0 mL of the *Assay preparation* and 0.5 mL of *Citrate buffer*. Dry-rinse the beaker in which the components of the two layers have been mixed with 1 g of chromatographic siliceous earth, and add it also to the top of *Column I*. Pack *Column II* with 3 g of chromatographic siliceous earth mixed with 2 mL of dibasic potassium phosphate solution (1 in 5.75). Pack *Column III* with 3 g of chromatographic siliceous earth mixed with 2 mL of sodium hydroxide solution (1 in 50). Place a small pad of glass wool above each column packing.

Procedure—Proceed as directed in the Assay under *Paregoric*. Calculate the percentage of anhydrous morphine in the Opium taken by the formula:

$$0.25(C/W)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of anhydrous morphine in the *Standard preparation*; *W* is the weight, in g, of Opium taken; and *A_U* and *A_S* are the corrected absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Powdered Opium

» Powdered Opium is Opium dried at a temperature not exceeding 70°, and reduced to a very fine powder.

Powdered Opium yields not less than 10.0 percent and not more than 10.5 percent of anhydrous morphine. It may contain any of the diluents, with the exception of starch, permitted for powdered extracts under *Extracts* (1151).

Packaging and storage—Preserve in well-closed containers.

Botanic characteristics—Consists chiefly of yellowish brown to yellow, more or less irregular and granular fragments of latex, varying from 15 to 150 µm in diameter; a

few fragments of strongly lignified, thick-walled, 4- to 5-sided or narrowly elongated, epidermal cells of the poppy capsule; very few fragments of tissues of poppy leaves, poppy capsules, and, occasionally, *Rumex* fruits. In addition, there will be the microscopic characteristics of the diluent if any has been used in the preparation of the powder.

Assay—Proceed with Powdered Opium as directed in the Assay under *Opium*.

Opium Tincture

» Opium Tincture contains, in each 100 mL, not less than 0.90 g and not more than 1.10 g of anhydrous morphine.

Opium Tincture may be prepared as follows.

Place 100 g of granulated or sliced Opium in a suitable vessel. [NOTE—Do not use Powdered Opium.] Add 500 mL of boiling water, and allow to stand, with frequent stirring, for 24 hours. Transfer the mixture to a percolator, allow it to drain, percolate with water as the menstruum to complete extraction, and evaporate the percolate to a volume of 400 mL. Boil actively for not less than 15 minutes, and allow to stand overnight. Heat the mixture to 80°, add 50 g of paraffin, and heat until the paraffin is melted. Beat the mixture thoroughly, and cool.

Remove the paraffin, and filter the concentrate, washing the paraffin and the filter with sufficient water to make the filtrate measure 750 mL. Add 188 mL of alcohol to the filtrate, mix, and assay a 10-mL portion of the resulting solution as directed in the Assay. Dilute the remaining solution with a mixture of 1 volume of alcohol and 4 volumes of water to obtain a Tincture containing 1 g of anhydrous morphine in each 100 mL. Mix.

Packaging and storage—Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

Alcohol Determination (611): between 17.0% and 21.0% of C₂H₅OH, determined by the gas-liquid procedure, acetone being used as the internal standard.

Assay—

Chromatographic tubes, Citrate buffer, Standard preparation, and Chromatographic columns—Prepare as directed in the Assay under *Paregoric*.

Assay preparation—Transfer 10.0 mL of Tincture to a 50-mL volumetric flask containing 10.0 mL of alcohol, add purified water to volume, and mix. Transfer a 2.0-mL aliquot of the solution, equivalent to about 4 mg of Morphine, to a 50-mL beaker, and add 0.5 mL of *Citrate buffer*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Paregoric*. Calculate the weight of anhydrous morphine, in g per 100 mL of the Tincture taken by the formula:

$$0.250W(A_U / A_S)$$

in which *W* is the weight, in mg, of anhydrous morphine in the 50 mL of *Standard preparation*, and *A_U* and *A_S* are the corrected absorbances of the solution from the *Assay preparation* and the *Standard preparation*, respectively.

Orbifloxacin

$C_{19}H_{20}F_3N_3O_3$ 395.38
1-Cyclopropyl-7-(*cis*-3,5-dimethyl-1-piperazinyl)-5,6,8-trifluoro-1,4-dihydro-4-oxo-3-quinolinecarboxylic acid [113617-63-3].

» Orbifloxacin contains not less than 98.5 percent and not more than 101.5 percent of $C_{19}H_{20}F_3N_3O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

USP Reference standards (11)—
USP Orbifloxacin RS

Identification—

A: *Infrared Absorption* (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

C: *X-Ray Diffraction* (941)—The X-ray diffraction pattern conforms to that of USP Orbifloxacin RS, similarly determined.

Microbial enumeration tests (61)—The total combined molds and yeasts count does not exceed 100 cfu per g.

pH (791): between 6.5 and 7.8, in a solution containing 10 mg per mL.

Water Determination, Method 1c (921): between 1.5% and 2.9%.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II** (231): not more than 20 ppm.

• (Official 1-Jan-2018)

Related compounds—

Buffer, Mobile phase, System suitability preparation, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay*.

Standard solution—Dilute, quantitatively with *Buffer*, the *Standard preparation* to obtain a solution having a known concentration of about 0.00004 mg per mL.

Test solution—Transfer about 40 mg of Orbifloxacin, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Buffer* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—Inject the *Buffer* as directed for *Procedure* to verify that there are no interfering peaks.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the percentage of related compounds in the portion of Orbifloxacin taken by the formula:

$$20,000(C_S)(r_i / r_S)(1 / F)$$

in which C_S is the concentration, in mg per mL, of orbifloxacin in the *Standard solution*; r_i is the peak area response for each impurity obtained from the *Test solution*; r_S is the peak area response for the orbifloxacin peak obtained from the *Standard solution*; and F is the relative response factor for each impurity, as presented in *Table 1*.

Assay—

Buffer—In a 2-L flask, dissolve about 11.8 g of sodium citrate in 1600 mL of water, and mix. Add 180 mL of acetic acid, and mix. Adjust with 6 N sodium hydroxide to a pH of 3.5, dilute with water to about 2 L, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer*, methanol, and dioxane (86:11:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard stock preparation—Dissolve in *Buffer* an accurately weighed quantity of USP Orbifloxacin RS to obtain a solution having a known concentration of about 0.2 mg per mL.

Standard preparation—Accurately transfer a quantity of *Standard stock preparation*, and dilute with *Buffer* to obtain a solution having a known concentration of about 0.02 mg per mL.

System suitability preparation—Dissolve about 40 mg of methyl 4-aminobenzoate in 2 mL of methanol, and dilute with *Buffer* to 200 mL. Pipet 10.0 mL of this solution and

Table 1

Component/Impurity	Approximate Relative Retention Time	Relative Response Factor (F)	Limit %

1-Cyclopropyl-5,6,7,8-tetrafluoro-1,4-dihydro-4-oxo-3-quinolinecarboxylic acid	6.8	0.16	NMT 0.2
Unknown	—	1.0	—
Total known and unknown	—	—	NMT 0.4

10.0 mL of *Standard stock preparation* into a 100-mL volumetric flask. Dilute with *Buffer* to volume, and mix.

Assay preparation—Transfer about 40 mg of Orbifloxacin accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Buffer* to volume, and mix. Dilute with *Buffer* an aliquot of the resulting solution to obtain a solution having a known concentration of about 0.02 mg per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 290-nm detector and 4.6-mm × 3.0-cm column that contains 3-μm packing L1. The flow rate is about 1.0 mL per minute. Prior to injecting the *System suitability preparation*, flush the column with approximately 50 mL of a mixture of acetonitrile and water (9:1). Chromatograph the *System suitability preparation*, and record the peak response as directed for *Procedure*: the relative retention times are about 1.3 for methyl 4-aminobenzoate and 1.0 for orbifloxacin; the resolution, R , between methyl 4-aminobenzoate and orbifloxacin is not less than 2; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatographs, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{19}H_{20}F_3N_3O_3$ in the portion of Orbifloxacin taken by the formula:

$$2000C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Orbifloxacin RS in the *Standard preparation*; and r_u and r_s are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Orbifloxacin Tablets

» Orbifloxacin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of orbifloxacin ($C_{19}H_{20}F_3N_3O_3$).

Packaging and storage—Preserve in tight containers, and store between 2° and 30°.

Labeling—Label to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Orbifloxacin RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201).

Absorbent: silica gel.

Diluent: a mixture of chloroform, methanol, and glacial acetic acid (8:1:1).

Test solution—Crush 1 Tablet and transfer into a centrifuge tube. Add *Diluent* quantitatively, and mix to obtain a final concentration of about 0.56 mg per mL of orbifloxacin. Centrifuge the solution.

Standard solution—Prepare a solution of USP Orbifloxacin RS in *Diluent* having a concentration of about 0.56 mg per mL.

Application volume: 5 μL

Developing solvent system: a mixture of chloroform, methanol, water, and ammonium hydroxide (18:7:1:0.02).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the

chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 1000 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{19}H_{20}F_3N_3O_3$ dissolved by employing the following procedure.

Standard solution—Prepare a solution of USP Orbifloxacin RS in *Medium* with a final concentration of about $L/100$, where L is the Tablet label claim in mg. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Medium* to volume, and mix.

Test solution—Pass a portion of the solution under test through a suitable 0.8-μm filter, discarding the first 3 mL.

Procedure—Determine the amount of $C_{19}H_{20}F_3N_3O_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 291 nm on portions of the *Test solution* in comparison with the *Standard solution* using *Medium* as blank. Calculate the amount of orbifloxacin dissolved by the formula:

$$100,000(A_u / A_s)(C_s / L)$$

in which A_u and A_s are the absorbances obtained with the *Test solution* and the *Standard solution*, respectively; C_s is the concentration, in mg per mL, of orbifloxacin in the *Standard solution*; and L is the Tablet label claim in mg.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{19}H_{20}F_3N_3O_3$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method 1c (921): between 3.5% and 7.0%.

Test preparation—Accurately weigh 5 Tablets, and transfer into a 50-mL centrifuge tube. Add 25 mL of anhydrous methanol, and cap.

Blank: 25 mL of anhydrous methanol in a 50-mL centrifuge tube.

Procedure—Rotate the *Test preparation* and the *Blank* for 16 hours. Centrifuge. Titrate an equal volume of the *Test preparation* and the *Blank* so that the amount of water titrated will be approximately 1000 μg to 1500 μg.

Chromatographic purity—

Buffer, Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system—Prepare as directed in the *Assay*.

Standard solution—Dilute quantitatively with *Buffer* the *Standard preparation* to obtain a solution having a known concentration of about 0.00004 mg per mL.

Test solution—Transfer 10 Tablets into a volumetric flask. Add *Buffer* to fill the flask about 70%, shake for 2 hours, and sonicate for 5 minutes. Dilute quantitatively, and stepwise if necessary, with *Buffer* to obtain a solution having a concentration of about 0.22 mg per mL. Pass a portion of the solution through a 0.8-μm filter.

Chromatographic system (see *Chromatography* (621))—Inject the *Buffer* as directed for *Procedure* to verify that there are no interfering peaks.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the percentage of related compounds in the portion of Tablets taken by the formula:

$$100(C_s / C_T)(r_i / r_s)(1 / F)$$

Table 1

Component	Relative Retention Time	Relative Response Factor (F)	Limit (%)
<i>cis</i> -1-Cyclopropyl-7-(3,5-dimethyl-1-piperazinyl)-5,6,8-trifluoro-4(1 <i>H</i>)-quinolinone	0.57	0.29	NMT 0.5
Orbifloxacin	1.0	1.00	—
<i>cis</i> -1-Cyclopropyl-7-(3,5-dimethyl-1-piperazinyl)-6,8-difluoro-1,4-dihydro-5-hydroxy-4-oxo-3-quinolinecarboxylic acid	2.9	0.71	NMT 0.5

in which C_s is the concentration, in mg per mL, of USP Orbifloxacin RS in the *Standard solution*; C_t is the concentration, in mg per mL, of the *Test solution*; r_i is the peak area response for each impurity obtained from the *Test solution*; r_s is the peak area response for the orbifloxacin peak obtained from the *Standard solution*; and F is the relative response factor for each impurity, as presented in Table 1.

Assay—

Buffer—In a 2-L flask, dissolve about 11.8 g of sodium citrate in 1600 mL of water, and mix. Add 180 mL of glacial acetic acid, and mix. Adjust with 6 N sodium hydroxide to a pH of 3.5, dilute with water to volume, and mix.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer*, methanol, and dioxane (91:6:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Orbifloxacin RS in *Buffer*, and dilute quantitatively, and stepwise if necessary, with *Buffer* to obtain a solution having a known concentration of about 0.2 mg per mL.

Standard preparation—Accurately transfer a quantity of *Standard stock preparation* and dilute quantitatively, and stepwise if necessary, with *Buffer* to obtain a solution having a known concentration of about 0.02 mg per mL.

System suitability preparation—Dissolve about 40 mg of methyl 4-aminobenzoate in 2 mL of methanol, and dilute with *Buffer* to 200 mL. Pipet 10.0 mL of this solution and 10.0 mL of the *Standard stock preparation* into a 100-mL volumetric flask. Dilute with *Buffer* to volume, and mix.

Assay preparation—Transfer 10 Tablets into a volumetric flask. Add *Buffer* to fill the flask about 70%, shake for 2 hours, and sonicate for 5 minutes. Dilute quantitatively, and stepwise if necessary, with *Buffer* to obtain a solution having a known concentration of about 0.02 mg per mL. Pass a portion of the solution through a 0.8- μ m filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 290-nm detector and 4.6-mm \times 3-cm column that contains 3- μ m packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability preparation*, and record the peak response as directed for *Procedure*: the relative retention times are about 1.3 for methyl 4-aminobenzoate and 1.0 for orbifloxacin; the resolution, R , between methyl 4-aminobenzoate and orbifloxacin is not less than 2; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of orbifloxacin ($C_{19}H_{20}F_3N_3O_3$) in the portion of Tablets taken by the formula:

$$C(D_u)(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Orbifloxacin RS in the *Standard preparation*; D_u is the dilution factor of the *Assay preparation*, in mL; and r_u and r_s are

the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Orlistat

$C_{29}H_{53}NO_5$ 495.73
L-Leucine, *N*-formyl-, 1-[(3-hexyl-4-oxo-2-oxetanyl)-methyl]dodecyl ester, [2*S*-(2 α (*R**), 3 β)]-;
N-Formyl-L-leucine, ester with (3*S*,4*S*)-3-hexyl-4-[(2*S*)-2-hydroxytridecyl]-2-oxetanone [96829-58-2].

DEFINITION

Orlistat contains NLT 98.0% and NMT 101.5% of orlistat ($C_{29}H_{53}NO_5$), calculated on the anhydrous, solvent-free basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (197K)**
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

[NOTE—Avoid the use of plastic flasks for the preparation or containment of any solution in this analysis.]

Mobile phase: Acetonitrile, phosphoric acid, and water (860:0.05:140)

Standard solution: 0.5 mg/mL of USP Orlistat RS in *Mobile phase*. Inject immediately after preparation or store at 5°.

Sample solution: 0.5 mg/mL of Orlistat in *Mobile phase*. Inject immediately after preparation or store at 5°.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 195

Column: 3.9-mm \times 15-cm; 4- μ m packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of orlistat ($C_{29}H_{53}NO_5$) in the portion of Orlistat taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Orlistat RS in the *Standard solution* (mg/mL)
 C_U = concentration of Orlistat in the *Sample solution* (mg/mL)
 Acceptance criteria: 98.0%–101.5% on the anhydrous, solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm • (Official 1-

Jan-2018)

- **LIMIT OF ORLISTAT RELATED COMPOUND A**

Standard solution: 0.1 mg/mL of USP Orlistat Related Compound A RS in acetone

Sample solution: 50 mg/mL of Orlistat in acetone

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Toluene and ethyl acetate (4:1)

Detection solution: Transfer 2.5 g of phosphomolybdic acid and 1 g of ceric sulfate into a 100-mL volumetric flask, and dissolve in and dilute with methanol to volume.

Analysis

Samples: *Standard solution* and *Sample solution*

Remove the plate, and air-dry it thoroughly. Spray the dried plate with *Detection solution*, and place the plate in an oven at 120° for 30 min.

Acceptance criteria: Any secondary spot from the *Sample solution* corresponding to orlistat related compound A is not more intense than the corresponding spot from the *Standard solution* (0.2%).

- **LIMIT OF ORLISTAT RELATED COMPOUND B**

Standard solution: 0.025 mg/mL of USP Orlistat Related Compound B RS in methylene chloride

Sample solution: 50 mg/mL of Orlistat in methylene chloride

Spiked sample solution: 50 mg/mL of Orlistat in *Standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 30-m fused silica, coated with a 0.25- μ m G27 stationary phase

Temperatures

Injector: 270°

Detector: 280°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	4	170	—
170	30	300	30

Carrier gas: Helium

Flow rate: 1 mL/min

Split ratio: 20:1

Injection volume: 2 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 10.0%

Analysis

Samples: *Standard solution*, *Sample solution*, and *Spiked sample solution*

Calculate the percentage of orlistat related compound B in the portion of Orlistat taken:

$$\text{Result} = \{r_U/[r_{SP} - r_U \times (C_T/C_U)]\} \times (C_S/C_U) \times 100$$

r_U = peak response of orlistat related compound B from the *Sample solution*

r_{SP} = peak response of orlistat related compound B from the *Spiked sample solution*

C_T = concentration of Orlistat in the *Spiked sample solution* (mg/mL)

C_U = concentration of Orlistat in the *Sample solution* (mg/mL)

C_S = concentration of USP Orlistat Related Compound B RS in the *Standard solution* (mg/mL)

Acceptance criteria: NMT 0.05% of orlistat related compound B is found.

- **ORGANIC IMPURITIES**

[NOTE—Avoid the use of plastic flasks for the preparation or containment of any solution in this analysis.]

Mobile phase, Standard solution, and Sample solution: Prepare as directed in the *Assay*.

System suitability solution: 10 μ g/mL of USP Orlistat RS and 0.1 μ g/mL of USP Orlistat Related Compound C RS in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 195 nm

Column: 3.9-mm \times 15-cm; 4- μ m packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 μ L

System suitability

Sample: *System suitability solution*

Suitability requirements

Signal-to-noise ratio: NLT 3 for orlistat related compound C

Relative standard deviation: NMT 10.0% for the orlistat peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity other than orlistat related compound A, orlistat related compound B, orlistat related compound D, orlistat open ring amide, and orlistat related compound E in the portion of Orlistat taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of orlistat from the *Standard solution*

C_S = concentration of USP Orlistat RS in the *Standard solution* (mg/mL)

C_U = concentration of Orlistat in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Formylleucine ^a	0.10	4.0	0.2

Sample: System suitability solution

Suitability requirements

Signal-to-noise ratio: NLT 3 for the orlistat related compound D peak

Relative standard deviation: NMT 10.0% for the orlistat peak

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of orlistat related compound D and orlistat open ring amide in the portion of Orlistat taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of orlistat related compound D or orlistat open ring amide from the Sample solution

r_s = peak response of orlistat from the Standard solution

C_s = concentration of USP Orlistat RS in the Standard solution (µg/mL)

C_u = concentration of Orlistat in the Sample solution (µg/mL)

F = relative response factor (see Table 3)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Orlistat related compound D	0.94	1.0	0.2
Orlistat	1.00	—	—
Orlistat open ring amide ^a	1.25	4.3	0.1

^a N-Formyl-L-leucine (S)-1-[(2S,3S)-2-hydroxy-3-[1-phenyl-R-ethyl-carbomoyl]nonyl]-dodecyl ester.

• LIMIT OF ORLISTAT RELATED COMPOUND E

Buffer: 0.4 N borate solution, adjusted to a pH of 10.2

Derivatizing agent: o-Phthalaldehyde (OPA) solution.

[NOTE—If unable to obtain commercially, the Derivatizing agent can be prepared as 1% each of 3-mercaptopropionic acid and o-phthalaldehyde in 0.4 M borate buffer solution.]

Solution A: Transfer 4.1 g of sodium acetate trihydrate and 40 mg of ethylenediaminetetraacetic acid (EDTA) into a 1-L volumetric flask. Dissolve in 950 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 7.2. Dilute with water to volume, add 2.5 mL of tetrahydrofuran, and mix. Filter, and degas.

Solution B: Transfer 2.7 g of sodium acetate trihydrate and 40 mg of EDTA into a 1-L volumetric flask. Dissolve in 200 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 7.2. Add 800 mL of acetonitrile, filter, and degas.

Mobile phase: See Table 4.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	96.7	3.3
20	60	40
24	0	100
38	0	100
38	96.7	3.3
45	96.7	3.3

Standard solution: Transfer a weighed quantity of about 0.2 mg of USP Orlistat Related Compound E RS into a 20-mL headspace vial. Add 10 mL of 4 N sodium hydroxide, and close the vial. Heat the vial to 100° for 1 h, then allow to cool to room temperature. Transfer 2 mL of the resulting solution into a 50-mL volumetric flask, and dilute with water to volume. To 0.5 mL of this solution add 2.0 mL of Buffer and 0.5 mL of Derivatizing agent.

Sample solution: Proceed as directed for the Standard solution, except use 25 mg of Orlistat to replace the 0.2 mg of USP Orlistat Related Compound E RS.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: Fluorescence 340 nm (excitation); 450 nm (emission)

Columns

Guard: 2.1-mm × 2-cm; 5-µm packing L1

C₁₈H₂₃NO 269.38**Orphenadrine Citrate Injection****DEFINITION**Orphenadrine Citrate Injection is a sterile solution of Orphenadrine Citrate in Water for Injection, prepared with the aid of Sodium Hydroxide. It contains NLT 93.0% and NMT 107.0% of the labeled amount of orphenadrine citrate (C₁₈H₂₃NO · C₆H₈O₇).**IDENTIFICATION****• A.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.**• B. IDENTIFICATION TESTS—GENERAL (191), Citrate:** Meets the requirements**ASSAY****• PROCEDURE****Buffer:** 5.8 g/L of monobasic ammonium phosphate in water. Adjust with ammonium hydroxide or phosphoric acid to a pH of 7.9 ± 0.05.**Mobile phase:** Methanol, acetonitrile, and *Buffer* (45:15:40)**System suitability solution:** 0.01 mg/mL each of USP Orphenadrine Related Compound B RS, USP Orphenadrine Related Compound C RS, USP Methylbenzhydrol RS, and 0.9 mg/mL of USP Orphenadrine Citrate RS in *Mobile phase***Standard solution:** 0.9 mg/mL of USP Orphenadrine Citrate RS in *Mobile phase***Sample solution:** Nominally 0.9 mg/mL of orphenadrine citrate from a known volume of the Injection con-

taining NLT 90 mg of orphenadrine citrate in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 20 μL

Run time: NLT 2.5 times the retention time of orphenadrine

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between orphenadrine related compound B and orphenadrine related compound C; NLT 3.0 between orphenadrine related compound C and methylbenzhydrol

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) in the portion of the injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Orphenadrine Citrate RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

IMPURITIES

• ORGANIC IMPURITIES

Buffer, *Mobile phase*, *System suitability solution*, *Sample solution*, and *Chromatographic system*: Proceed as directed in the *Assay*.

Standard solution: 0.002 mg/mL of USP Orphenadrine Citrate RS in *Mobile phase*

Sensitivity solution: 0.001 mg/mL of USP Orphenadrine Citrate RS from the *Standard solution* in *Mobile phase*

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 3.0 between orphenadrine related compound B and orphenadrine related compound C; NLT 3.0 between orphenadrine related compound C and methylbenzhydrol

Orphenadrine Citrate Extended-Release Tablets

DEFINITION

Orphenadrine Citrate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$).

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**PROCEDURE**

Buffer: 5.8 g/L of monobasic ammonium phosphate.

Adjust with phosphoric acid to a pH of 3.2.

Mobile phase: Acetonitrile and *Buffer* (40:60)

System suitability solution: 0.1 mg/mL of USP Orphenadrine Citrate RS and 0.01 mg/mL each of USP Orphenadrine Related Compound B RS and USP Orphenadrine Related Compound C RS, in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Orphenadrine Citrate RS

Sample stock solution: Nominally 0.5 mg/mL of orphenadrine citrate prepared as follows. Transfer a quantity of powder equivalent to NLT 100 mg of orphenadrine citrate, from finely powdered Tablets (NLT 20), to a suitable volumetric flask. Add 50% of the flask volume of *Mobile phase*. Sonicate for 5 min and shake for 15 min. Dilute with *Mobile phase* to volume. Pass through a suitable filter.

Sample solution: 0.1 mg/mL of orphenadrine citrate in *Mobile phase* from *Sample stock solution*

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 3.9-mm × 30-cm; 10-μm L1 packing

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 1.2 between orphenadrine and orphenadrine related compound C; NLT 2.0 between orphenadrine citrate and orphenadrine related compound B

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Orphenadrine Citrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of orphenadrine citrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**DISSOLUTION (711)****Test 1**

Medium: Water; 900 mL, deaerated

Apparatus 2: 50 rpm

Times: 1, 2, 6, and 12 h

Buffer: 5.8 g/L of monobasic ammonium phosphate in water

Mobile phase: Acetonitrile and *Buffer* (40:60). Adjust with phosphoric acid to a pH of 3.2 ± 0.1 .

Standard stock solution: 1 mg/mL of USP Orphenadrine Citrate RS in *Mobile phase*. Sonication may be used to promote dissolution.

Standard solution: 0.1 mg/mL of USP Orphenadrine Citrate RS in *Medium* from a suitable volume of *Standard stock solution* and *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter with 0.45-μm pore size and discard the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 3.9-mm × 30-cm; 10-μm packing L1

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis:

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved in the portion of the sample withdrawn at each time point (i) (mg/mL):

$$C_i = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_1 \times V_3)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{C_3 \times [V - (2 \times V_3)] + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{C_4 \times [V - (3 \times V_3)] + [(C_3 + C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

C_i = concentration of orphenadrine citrate in the portion of sample withdrawn at time point (i) (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 1*.

Table 1

Time point (i)	Time (h)	Amount Dissolved (%)
1	1	10–40
2	2	30–50
3	6	50–80
4	12	NLT 80

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 1, 4, and 12 h

Standard solution: 0.02 mg/mL of USP Orphenadrine Citrate RS in *Medium*

Sample solution: Withdraw 10 mL of the solution under test from each vessel at each specified time point. Replace 10 mL of *Medium* in each vessel. Pass a portion of the solution under test through a suitable filter having a porosity of 0.45 μm. Transfer 1.0 mL of

the filtrate to a 50-mL volumetric flask, and dilute with Medium to volume.

Blank: Medium

Instrumental conditions

Mode: UV 210 nm

Analysis

Samples: Standard solution and Sample solution

Calculate the concentration (C_i) of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result} = (A_U/A_S) \times C_S \times D_S \times (1/L) \times V \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of the Standard solution (mg/mL)

D_S = dilution factor of the Sample solution, 50

L = label claim (mg/Tablet)

V = volume of Medium, 900 mL

Calculate the percentage of the labeled amounts (Q) of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = [(C_3 \times V) + [(C_2 + C_1) \times V_3]] \times (1/L) \times 100$$

C_i = concentration of orphenadrine citrate in the portion of sample withdrawn at time point (i) (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

V_3 = volume of the Sample solution withdrawn at each time point (mL)

Tolerances: See Table 2.

Table 2

Time point (i)	Time (h)	Amount Dissolved (%)
1	1	10–40
2	4	40–70
3	12	NLT 80

^aThe peak is due to counter ion and is not to be reported or included in total degradation products.

^bAlso known as phenyl(o-tolyl)methanol.

^cAlso known as phenyl(o-tolyl)methanone.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, tight, light-resistant containers, and store at controlled room temperature.
- **LABELING:** When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
 - USP Orphenadrine Citrate RS
 - USP Orphenadrine Related Compound B RS
 - N-Ethyl-N,N-dimethyl [2-(2-methylbenzhydryloxy)ethyl]ammonium chloride; also known as N-ethyl-N,N-dimethyl-2-[phenyl(o-tolyl)methoxy]ethanaminium chloride. $C_{20}H_{28}ClNO$ 333.90
 - USP Orphenadrine Related Compound C RS
 - N-Methyl [2-(2-methylbenzhydryloxy)ethyl]amine hydrochloride; also known as N-methyl-2-[phenyl(o-tolyl)methoxy]ethanamine hydrochloride. $C_{17}H_{22}ClNO$ 291.82

Orphenadrine Citrate, Aspirin, and Caffeine Tablets

DEFINITION

Orphenadrine Citrate, Aspirin, and Caffeine Tablets contain NLT 90.0% and NMT 110.0% each of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$), aspirin ($C_9H_8O_4$), and caffeine ($C_8H_{10}N_4O_2$).

IDENTIFICATION

- **A.** The retention times of the orphenadrine, aspirin, and caffeine peaks in the chromatogram of the Sample solution correspond to those of the orphenadrine, aspirin, and caffeine peaks in the chromatogram of the Standard solution, as obtained in the Orphenadrine Citrate and Aspirin and Caffeine tests in the Assay.

ASSAY• **ORPHENADRINE CITRATE**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.6. To each L of this solution add 5.8 g of sodium dodecyl sulfate, and dissolve.

Mobile phase: Acetonitrile and *Buffer* (50:50)

Diluent: Methanol and glacial acetic acid (92:8)

Standard solution: 0.1 mg/mL of USP Orphenadrine Citrate RS prepared as follows. Transfer the weighed amount of standard to a suitable volumetric flask with the aid of methanol. Add glacial acetic acid to fill 8% of final volume and methanol to fill 75% of final volume. Sonicate with occasional shaking for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate.

Sample stock solution: Nominally 0.5 mg/mL of orphenadrine citrate from Tablets (NLT 5), prepared as follows. To the volumetric flask containing the Tablets, add glacial acetic acid to fill 8% of final volume and methanol to fill 75% of final volume. Sonicate with occasional hand shaking for NLT 15 min. Shake mechanically for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume. [NOTE—This solution also contains 7.7 mg/mL of aspirin and 0.6 mg/mL of caffeine.]

Sample solution: Nominally 0.1 mg/mL of orphenadrine citrate by diluting a suitable portion of the *Sample stock solution* with *Diluent*. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate. [NOTE—This solution also contains 1.5 mg/mL of aspirin and 0.1 mg/mL of caffeine.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 257 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 15 μ L

Run time: 1.5 times the retention time of orphenadrine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Orphenadrine Citrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of orphenadrine citrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

• **ASPIRIN AND CAFFEINE**

Buffer: Dissolve 0.8 g/L of hexanesulfonic acid sodium salt in water. Adjust with glacial acetic acid to a pH of 3.0.

Mobile phase: Methanol and *Buffer* (40:60)

Diluent: Methanol and glacial acetic acid (92:8)

Standard solution: 1.5 mg/mL of USP Aspirin RS and 0.1 mg/mL of USP Caffeine RS prepared as follows. Transfer the weighed amount of standards to a suitable volumetric flask with the aid of methanol. Add glacial acetic acid to fill 8% of final volume and methanol to

fill 75% of final volume. Sonicate with occasional hand shaking for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate.

Sample stock solution: Nominally 7.7 mg/mL of aspirin from Tablets (NLT 5), prepared as follows. To the volumetric flask containing the Tablets, add glacial acetic acid to fill 8% of final volume and methanol to fill 75% of final volume. Sonicate with occasional hand shaking for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume. [NOTE—This solution also contains 0.6 mg/mL of caffeine and 0.5 mg/mL of orphenadrine citrate.]

Sample solution: Nominally 1.5 mg/mL of aspirin by diluting a suitable portion of the *Sample stock solution* with *Diluent*. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate. [NOTE—This *Sample solution* also contains 0.1 mg/mL of caffeine and 0.1 mg/mL of orphenadrine citrate.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L1

Flow rate: 1.2 mL/min

Injection volume: 15 μ L

Run time: 3 times the retention time of aspirin

System suitability

[NOTE—The relative retention time for caffeine and for aspirin is 0.70 and 1.0, respectively.]

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between caffeine and aspirin peaks

Relative standard deviation: NMT 2.0% each for both the caffeine and aspirin peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aspirin ($C_9H_8O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Aspirin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of aspirin in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of caffeine ($C_8H_{10}N_4O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Caffeine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of caffeine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of aspirin and caffeine

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 45 min for aspirin and caffeine; 60 min for orphenadrine

Separate dissolution baths must be run for the different time points.

Orphenadrine citrate

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.6. To each L of this solution add 5.8 g of sodium dodecyl sulfate, and dissolve.

Mobile phase: Acetonitrile and *Buffer* (50:50)

Standard solution: (L/900) mg/mL of USP Orphenadrine Citrate RS in *Medium*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 257 nm

Column: 3.9-mm × 30-cm; 10-μm packing L1

Flow rate: 2 mL/min

Injection volume: 100 μL

Run time: 1.2 times the retention time of orphenadrine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 3.0%

Calculate the percentage (Q) of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response for orphenadrine from the *Sample solution*

r_S = peak response for orphenadrine from the *Standard solution*

C_S = concentration of USP Orphenadrine Citrate RS in the *Standard solution* (mg/mL)

L = label claim for orphenadrine (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of orphenadrine is dissolved in 60 min.

Aspirin and caffeine

Buffer: 0.8 g/L of hexanesulfonic acid sodium salt in water

Mobile phase: Methanol and *Buffer* (40:60). Adjust with glacial acetic acid to a pH of 3.0.

Standard stock solution: 1.0 mg/mL of USP Aspirin RS, 0.1 mg/mL of USP Caffeine RS, and 0.1 mg/mL of USP Salicylic Acid RS prepared as follows. Transfer the weighed amount of standards to a suitable volumetric flask with the aid of methanol. Add glacial acetic acid to fill 8% of final volume and methanol to fill 75% of final volume. Sonicate with occasional shaking for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume.

Standard solution: Dilute a suitable volume of the *Standard stock solution* with methanol to obtain a final concentration of about 0.25 mg/mL of USP Aspirin RS and 0.025 mg/mL each of USP Caffeine RS and USP Salicylic acid RS.

Sample solution: At the time specified, withdraw the solution under test and pass through a suitable filter. If necessary, dilute the filtrate with methanol to obtain a final concentration similar to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; 10-μm packing L1

Flow rate: 1.2 mL/min

Injection volume: 15 μL

Run time: 2 times the retention time of aspirin

System suitability

[NOTE—The relative retention times for caffeine, aspirin, and salicylic acid are 0.70, 1.0, and 1.3, respectively.]

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0% for both the caffeine and aspirin peaks

Calculate the percentage (Q) of the labeled amount of aspirin ($C_9H_8O_4$) or caffeine ($C_8H_{10}N_4O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times V \times 100$$

r_U = peak response for aspirin or caffeine from the *Sample solution*

r_S = peak response for aspirin or caffeine from the *Standard solution*

C_S = concentration of USP Aspirin RS or USP Caffeine RS in the *Standard solution* (mg/mL)

L = label claim for aspirin or caffeine (mg/Tablet)

D = dilution factor, if applicable

V = volume of *Medium*, 900 mL

Calculate the percentage of salicylic acid ($C_7H_6O_3$), relative to the labeled amount of aspirin, dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times V \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response for salicylic acid from the *Sample solution*

r_S = peak response for salicylic acid from the *Standard solution*

C_S = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)

L = label claim for aspirin (mg/Tablet)

D = dilution factor

M_{r1} = molecular weight of aspirin, 180.16

M_{r2} = molecular weight of salicylic acid, 138.12

V = volume of *Medium*, 900 mL

The percentage of salicylic acid dissolved should be added to the percentage of aspirin dissolved.

Tolerances: NLT 70% (Q) of the labeled amounts of aspirin and caffeine is dissolved in 45 min.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **LIMIT OF 2-METHYLBENZHYDROL**

Buffer: 6.8 g/L of monobasic potassium phosphate in water

Mobile phase: To 1 L of *Buffer* add 5.8 g of sodium dodecyl sulfate and 1 L of acetonitrile. Adjust with phosphoric acid to a pH of 3.6.

Standard solution: 7.5 μg/mL of USP 2-Methylbenzhydrol RS in methanol

Sample solution: Nominally 1.5 mg/mL of orphenadrine citrate in methanol from a portion of finely powdered Tablets (NLT 20 Tablets). [NOTE—This *Sample solution* also contains 0.6 mg/mL of caffeine and 0.5 mg/mL of orphenadrine citrate.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 213 nm

Column: 4.6-mm × 150-mm; 5-μm packing L1

Flow rate: 1.2 mL/min

Injection volume: 10 μL

Run time: 2.5 times the retention time of 2-methylbenzhydrol

System suitability

Sample: *Standard solution*

Suitability requirements:

Tailing factor: NMT 1.5

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of 2-methylbenzhydrol in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP 2-Methylbenzhydrol RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of orphenadrine citrate in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.5%

• ORGANIC IMPURITIES

Buffer: 0.8 g/L of sodium 1-hexanesulfonate in water. Adjust with glacial acetic acid to a pH of 3.0.

Mobile phase: Methanol and *Buffer* (40:60)

Diluent: Methanol and glacial acetic acid (92:8)

System suitability solution: 0.6 mg/mL of USP Salicylic Acid RS, 1.5 mg/mL of USP Aspirin RS, and 0.1 mg/mL of USP Caffeine RS prepared as follows.

Transfer the weighed amount of standards to a suitable volumetric flask with the aid of methanol. Add glacial acetic acid to fill 8% of final volume and methanol to fill 75% of final volume. Sonicate with occasional hand shaking for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate.

Standard solution: 0.04 mg/mL of USP Salicylic Acid RS prepared as follows. Transfer the weighed amount of standard to a suitable volumetric flask with the aid of methanol. Add glacial acetic acid to fill 8% of final volume, and dilute with methanol to volume. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate.

Sample stock solution: Nominally 7.7 mg/mL of aspirin from Tablets (NLT 5), prepared as follows. To the volumetric flask containing the Tablets, add glacial acetic acid to fill 8% of final volume and methanol to fill 75% of final volume. Sonicate with occasional hand shaking for NLT 15 min. Allow the solution to equilibrate to room temperature. Dilute with methanol to volume. [NOTE—This solution also contains 0.5 mg/mL of orphenadrine citrate and 0.6 mg/mL of caffeine.]

Sample solution: Nominally 1.5 mg/mL of aspirin by diluting a suitable portion of the *Sample stock solution* with *Diluent*. Filter a portion through a suitable filter of 0.45- μ m pore size, discarding at least the first 3 mL of the filtrate. [NOTE—This *Sample solution* also contains 0.1 mg/mL of orphenadrine citrate and 0.1 mg/mL of caffeine.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L1

Flow rate: 1.2 mL/min

Injection volume: 25 μ L

Run time: 3 times the retention time of the aspirin peak

System suitability

[NOTE—Refer to *Table 1* for relative retention times.]

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between the caffeine and aspirin peaks and NLT 1.5 between the aspirin and salicylic acid peaks, *System suitability solution*

Relative standard deviation: NMT 2.0% each for aspirin and caffeine peaks, *System suitability solution*; NMT 3.0% for salicylic acid, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of salicylic acid in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of aspirin in the *Sample solution* (mg/mL)

Calculate the percentage of other organic impurities in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = sum of the areas of all other organic impurities from the *Sample solution*

r_T = sum of the areas of all peaks from the *Sample solution*

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Caffeine	0.70	—
Aspirin	1.0	—
Salicylic acid	1.3	3.0
Total impurities ^a	—	2.0

^a Does not include salicylic acid and 2-methylbenzhydrol.

Total unspecified impurity	—	—	0.4

^a (3*R*,4*R*,5*S*)-4-Acetylamino-5-amino-3-(1-ethylpropoxy)-1-cyclohexene-1-carboxylic acid.

^b 4-Acetylamino-3-hydroxybenzoic acid ethyl ester.

• PROCEDURE 2: OSELTAMIVIR RELATED COMPOUND A

Buffer: 1.54 g/L of ammonium acetate in water

Mobile phase: Acetonitrile, water, and *Buffer* (3:6:1)

Stock solution A: 50 µg/mL of USP Oseltamivir Related Compound A RS, prepared as follows: Dissolve in alcohol, using 5% of final volume, and dilute with water to volume.

Solution A: 1 µg/mL of USP Oseltamivir Related Compound A RS in water from *Stock solution A*

Standard solution: 10 mg/mL of USP Oseltamivir Phosphate RS in *Solution A*

Sample solution: 10 mg/mL of Oseltamivir Phosphate in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detectors: UV 210 nm and mass spectrometer

Column: 3.0-mm × 5-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 1 µL

Temperature: 40°

Use electrospray (+) ionization, a selected ion monitoring mode with m/z of 356.2 (protonated oseltamivir related compound A). Adjust the dwell time, fragmentation voltage, drying gas temperature, drying gas flow, nebulizer pressure, and capillary voltage as appropriate for an optimal response. [NOTE—A post-column flow splitter with a split ratio of about 3:1 is used.]

System suitability

Sample: *Standard solution*

[NOTE—The relative retention time for oseltamivir related compound A versus oseltamivir is about 2.6.]

Suitability requirements

Resolution: The oseltamivir related compound A peak (detected by MD-SIM mode) and the oseltamivir peak (detected by UV) are baseline resolved.

[NOTE—The resolution of the two components minimizes background noise and ion suppression effects for the trace of oseltamivir related compound A by the oseltamivir matrix.]

Relative standard deviation: NMT 15.0%, oseltamivir related compound A peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oseltamivir related compound A in the portion of Oseltamivir Phosphate taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of oseltamivir related compound A from the *Sample solution*

- r_s = peak response of oseltamivir related compound A from the *Standard solution*
 C_s = concentration of USP Oseltamivir Related Compound A RS in the *Standard solution* (mg/mL)
 C_u = concentration of oseltamivir phosphate in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.01%

• **PROCEDURE 3: LIMIT OF TRIBUTYL PHOSPHINE OXIDE**

Blank: Transfer 1.0 mL of suitable derivatizing reagent¹ to a vial. Close the vial, shake, and heat for 20 min at 60°. Centrifuge the pyridinium salt precipitate.

Standard stock solution 1: 21 mg/mL of USP Tributyl Phosphine Oxide RS in pyridine

Standard stock solution 2: 21 mg/mL of USP Oseltamivir Phosphate RS in suitable derivatizing reagent. Close the vial, mix, and heat for 20 min at 60°. Centrifuge the pyridinium salt precipitate.

Standard solution: 21 µg/mL each of USP Tributyl Phosphine Oxide RS and USP Oseltamivir Phosphate RS in pyridine from *Standard stock solution 1* and *Standard stock solution 2*, respectively

Sample solution: Transfer 15 mg of Oseltamivir Phosphate to a vial. Add 1.0 mL of suitable derivatizing reagent. Close the vial, mix, and heat for 20 min at 60°. Centrifuge the pyridinium salt precipitate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m capillary column coated with a 0.25-µm phase G1

Split ratio: 1:50

Split flow: 64 mL/min

Injection size: 1 µL

Temperature

Detector: 260°

Injection port: 260°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
180	0	180	2
180	8	250	10

Linear velocity: 27 cm/s

Carrier gas: Helium

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for tributyl phosphine oxide and oseltamivir phosphate are about 0.54 and 1.00, respectively.]

Suitability requirements

Relative standard deviation: NMT 10.0% for the tributyl phosphine oxide and oseltamivir phosphate peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tributyl phosphine oxide in the portion of Oseltamivir Phosphate taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

¹ Tri-Sil Reagent (product number: 48999 0049001) may be obtained from Pierce: www.piercenet.com.

- r_u = peak response of tributyl phosphine oxide from the *Sample solution*
 r_s = peak response of tributyl phosphine oxide from the *Standard solution*
 C_s = concentration of tributyl phosphine oxide in the *Standard solution* (mg/mL)
 C_u = concentration of Oseltamivir Phosphate in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1%

SPECIFIC TESTS

• **WATER DETERMINATION, Method I (921):** NMT 0.5%

• **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 10 mg/mL in water

Acceptance criteria: Between -30.7 and -32.6

Oseltamivir Phosphate Capsules

DEFINITION

Oseltamivir Phosphate Capsules contain Oseltamivir Phosphate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of oseltamivir ($C_{16}H_{28}N_2O_4$).

IDENTIFICATION

• The retention time of the major peaks of the *Sample solution* corresponds to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **OSELTAMIVIR**

Solution A: Dissolve 6.8 g of potassium dihydrogen phosphate in 980 mL of water. Adjust with 1 M potassium hydroxide solution to a pH of 6.0, and dilute with water to 1 L.

Mobile phase: Methanol, acetonitrile, and *Solution A* (245:135:620)

Diluent: Methanol, acetonitrile, and 0.01 N phosphoric acid (245:135:620)

Standard solution: 1 mg/mL of USP Oseltamivir Phosphate RS in *Diluent*

Sample solution: Weigh the contents of 20 Capsules, and mix. Prepare the equivalent of about 1 mg of oseltamivir phosphate per mL, based on the label claim, by first dispersing a suitable portion of the powder in about 40% of the flask volume of *Diluent* using an ultrasonic bath for about 20 min, and diluting with *Diluent* to volume. Centrifuge an aliquot of this solution, and use the supernatant.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 207 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 1.2 mL/min

Injection size: 15 µL

System suitabilitySample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of oseltamivir (C₁₆H₂₈N₂O₄) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Oseltamivir Phosphate RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of oseltamivir in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of oseltamivir, 312.40
 M_{r2} = molecular weight of oseltamivir phosphate, 410.40

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**• DISSOLUTION (711)**

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 20 min

Detector: UV 240 nm

Standard solution: Prepare a solution in *Medium* having a known concentration of about 0.11 mg/mL of USP Oseltamivir Phosphate RS. Quantitatively dilute a portion of this solution with *Medium* to obtain a solution having a known concentration similar to the expected concentration in the solution under test.

Sample solution: Pass a portion of the solution under test through a suitable filter of 1-µm pore size.

Excipients solution: Suspend an amount of the placebo mixture equivalent to the weight of the excipients in one dosage unit and one empty Capsule shell in 900 mL of *Medium*. Heat to 37°, and filter.

AnalysisSamples: *Medium*, *Standard solution*, *Sample solution*, and *Excipients solution*

Determine the amount of oseltamivir phosphate (C₁₆H₂₈N₂O₄ · H₃PO₄) dissolved by measuring the absorbance at about 240 nm of the *Sample solution* and *Excipients solution* in comparison with the *Standard solution*, using the *Medium* as the blank. Calculate the percentage of oseltamivir phosphate dissolved:

$$\text{Result} = [(A_U - A_E) \times C_S \times V \times 100] / (A_S \times L)$$

- A_U = absorbance of the *Sample solution*
 A_E = absorbance of the *Excipients solution*
 C_S = concentration of USP Oseltamivir Phosphate RS in the *Standard solution*
 V = volume of *Medium*, 900 mL
 A_S = absorbance of the *Standard solution*
 L = label claim for oseltamivir phosphate (mg/Capsule)

Tolerances: NLT 75% (Q) of the labeled amount of oseltamivir phosphate is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements**IMPURITIES****• ORGANIC IMPURITIES**

Solution A, Mobile phase, Diluent, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

AnalysisSamples: *Standard solution* and *Sample solution*

Calculate the percentage of individual impurities in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response of each individual impurity from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Oseltamivir Phosphate RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of oseltamivir in the *Sample solution* (mg/mL)
 F = relative response factor from *Table 1*
 M_{r1} = molecular weight of oseltamivir, 312.40
 M_{r2} = molecular weight of oseltamivir phosphate, 410.40

Acceptance criteria: See *Table 1*.**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity A ^a	0.18	1.4	2.0
Impurity B ^b	0.49	2.7	0.3
Oseltamivir phosphate	1.00	1.0	—
Impurity C ^c	1.45	0.9	0.5

 4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-6-[[[(5-methyl-3-phenyl-4-isoxazolyl)-carbonyl]amino]-7-oxo-, monosodium salt, monohydrate, [2*S*-(2*α*,5*α*,6*β*)]-;

Monosodium (2S,5R,6R)-3,3-dimethyl-6-(5-methyl-3-phenyl-4-isoxazolecarboxamido)-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [7240-38-2].

Anhydrous

$C_{19}H_{18}N_3NaO_5S$ 423.43
[1173-88-2].

DEFINITION

Oxacillin Sodium contains the equivalent of NLT 815 µg/mg and NMT 950 µg/mg of oxacillin ($C_{19}H_{19}N_3O_5S$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL** (191), *Sodium*: Meets the requirements

ASSAY

PROCEDURE

Protect solutions containing oxacillin from light.

Solution A: 1.18 g/L of sodium 1-hexanesulfonate monohydrate and 0.8 mL/L of ammonium hydroxide in water, adjusted with phosphoric acid to a pH of 2.8–3.2

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
20	30	70

Return to the original conditions and re-equilibrate the system.

Diluent: Acetonitrile and water (15:85)

System suitability stock solution: 0.1 mg/mL of USP Oxacillin Related Compound C RS in *Diluent*. Sonicate as needed to dissolve.

System suitability solution: 0.01 mg/mL of USP Oxacillin Related Compound C RS from *System suitability stock solution* and 1 mg/mL of USP Oxacillin Sodium RS in *Diluent*. Store this solution at 4°.

Standard solution: 1 mg/mL of USP Oxacillin Sodium RS in *Diluent*. Sonicate as needed to dissolve. Store this solution at 4°.

Sample solution: 1 mg/mL of Oxacillin Sodium in *Diluent*. Sonicate as needed to dissolve. Store this solution at 4°.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Temperatures

Column: 40°

Autosampler: 4°

Flow rate: 1.5 mL/min

Injection volume: 2 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for oxacillin related compound C and oxacillin are about 0.96 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between oxacillin related compound C and oxacillin, *System suitability solution*

Tailing factor: 0.8–1.5, *Standard solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the quantity, in µg/mg, of oxacillin ($C_{19}H_{19}N_3O_5S$) in the portion of Oxacillin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxacillin Sodium RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxacillin Sodium in the *Sample solution* (mg/mL)

P = potency of oxacillin in USP Oxacillin Sodium RS (µg/mg)

Acceptance criteria: 815–950 µg/mg

IMPURITIES

ORGANIC IMPURITIES

Protect solutions containing oxacillin from light.

Solution A: 6 g/L of anhydrous monobasic sodium phosphate, 0.56 g/L of sodium 1-hexanesulfonate monohydrate, and 0.05 g/L of edetate disodium. Adjust with phosphoric acid to a pH of 3.0–3.2.

Solution B: Acetonitrile

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	90	10
3	90	10
30	50	50
40	15	85
45	15	85

Return to the original conditions and re-equilibrate the system.

Diluent: Acetonitrile and water (15:85)

System suitability stock solution: 0.1 mg/mL of USP Oxacillin Related Compound C RS in *Diluent*. Do not sonicate.

System suitability solution: 0.01 mg/mL of USP Oxacillin Related Compound C RS from *System suitability stock solution* and 1 mg/mL of USP Oxacillin Sodium RS in *Diluent*. Store this solution at 4°.

Standard solution: 0.01 mg/mL of USP Oxacillin Sodium RS in *Diluent*. Do not sonicate. Store this solution at 4°.

Sample solution: 1 mg/mL of Oxacillin Sodium in *Diluent*. Do not sonicate. Store this solution at 4°.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between oxacillin related compound C and oxacillin, *System suitability solution*

Tailing factor: 0.8–1.5, *Standard solution*

Relative standard deviation: NMT 2.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Oxacillin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (F_1/F_2) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxacillin Sodium RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxacillin Sodium in the *Sample solution* (mg/mL)

P = potency of oxacillin in USP Oxacillin Sodium RS ($\mu\text{g}/\text{mg}$)

F_1 = conversion factor, 0.001 mg/ μg

F_2 = relative response factor (see Table 3)

Acceptance criteria: See Table 3. The reporting threshold is 0.05%.

Table 3

Oxacillin Sodium Capsules**DEFINITION**

Oxacillin Sodium Capsules contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of oxacillin (C₁₉H₁₉N₃O₅S).

IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 2.7 g/L of monobasic potassium phosphate
Mobile phase: Acetonitrile, methanol, and *Solution A* (300:100:700)

Standard solution: 0.11 mg/mL of USP Oxacillin Sodium RS in water. Use this solution on the day prepared.

Sample stock solution: Nominally 0.5 mg/mL of oxacillin in water, prepared as follows. Remove, as completely as possible, the contents of NLT 10 Capsules, and weigh. Mix, and transfer a suitable portion of the powder to a volumetric flask. Add water to volume, and mix for 10 min with the aid of a magnetic stirrer. Pass a portion of the solution through a suitable filter, discarding the first 5 mL of the filtrate.

Sample solution: Nominally 0.1 mg/mL of oxacillin from *Sample stock solution* in water. Use this solution on the day prepared.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4-mm × 30-cm; packing L11

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 1.6

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxacillin ($C_{19}H_{19}N_3O_5S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Oxacillin Sodium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxacillin in the *Sample solution* (mg/mL)

P = potency of oxacillin in USP Oxacillin Sodium RS (µg/mg)

F = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: USP Oxacillin Sodium RS in *Medium*

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*, if necessary, to obtain a concentration that is similar to that of the *Standard solution*

Analysis: Determine the amount by a suitable validated spectrophotometric method.

Tolerances: NLT 75% (Q) of the labeled amount of oxacillin ($C_{19}H_{19}N_3O_5S$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements**SPECIFIC TESTS**• **WATER DETERMINATION** (921), *Method I*: NMT 6.0%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers, at controlled room temperature.• **USP REFERENCE STANDARDS** (11)

USP Oxacillin Sodium RS

Oxacillin Injection**DEFINITION**

Oxacillin Injection is a sterile isoosmotic solution of Oxacillin Sodium in Water for Injection. It contains the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of oxacillin ($C_{19}H_{19}N_3O_5S$). It contains dextrose as a tonicity-adjusting agent and one or more suitable buffer substances. It contains no preservatives.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 2.7 g/L of monobasic potassium phosphate
Mobile phase: Acetonitrile, methanol, and *Solution A* (300:100:700)

Standard solution: 0.11 mg/mL of USP Oxacillin Sodium RS. Use this solution on the day prepared.

Sample solution: Nominally 0.1 mg/mL of oxacillin from one container of Injection that has been allowed to thaw. Use this solution on the day prepared.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Detector: UV 225 nm

Column: 4-mm × 30-cm; packing L11

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 1.6

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxacillin ($C_{19}H_{19}N_3O_5S$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxacillin Sodium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxacillin in the *Sample solution* (mg/mL)

P = potency of oxacillin in USP Oxacillin Sodium RS (µg/mg)

F = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–115.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*.

- **pH** (791): 6.0–8.5

- **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections

- **PYROGEN TEST** (151): It meets the requirements, the test dose being a volume of undiluted Injection providing the equivalent of 20 mg/kg of oxacillin.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging*. Maintain in the frozen state.
- **LABELING:** It meets the requirements in *Labeling* (7), *Labels and Labeling for Injectable Products*. The label states that it is to be thawed just before use; it describes conditions for proper storage of the resultant solution; and it directs that the solution is not to be refrozen.
- **USP REFERENCE STANDARDS** (11)
USP Oxacillin Sodium RS

Oxacillin for Injection**DEFINITION**

Oxacillin for Injection contains an amount of Oxacillin Sodium equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of oxacillin ($C_{19}H_{19}N_3O_5S$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 2.7 g/L of monobasic potassium phosphate
Mobile phase: Acetonitrile, methanol, and *Solution A* (300:100:700)

Standard solution: 0.11 mg/mL of USP Oxacillin Sodium RS. Use on the day prepared.

Sample solution 1 (where it is represented as being in a single-dose container): Nominally 0.1 mg/mL of oxacillin in water, prepared as follows. Constitute Oxacillin for Injection in a volume of water corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents using a suitable hypodermic needle and syringe, and dilute with water to obtain a solution containing nominally 0.1 mg/mL of oxacillin. Use on the day prepared.

Sample solution 2 (where the label states the quantity of oxacillin in a given volume of constituted solution): Nominally 0.1 mg/mL of oxacillin in water, prepared as follows. Constitute Oxacillin for Injection with a volume of water corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution with water to obtain a solution containing nominally 0.1 mg/mL of oxacillin. Use on the day prepared.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- r_U = peak area from the *Sample solution*
 r_S = peak area from the *Standard solution*
 C_S = concentration of USP Oxacillin Sodium RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of oxacillin in the *Sample solution* (mg/mL)
 P = potency of oxacillin in USP Oxacillin Sodium RS (μ g/mg)
 F = conversion factor, 0.001 mg/ μ g
 Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

• UNIFORMITY OF DOSAGE UNITS (905)

For solids packaged in single-unit containers

Acceptance criteria: Meets the requirements

• DELIVERABLE VOLUME (698): Meets the requirements

SPECIFIC TESTS

• WATER DETERMINATION (921), Method I: NMT 1.0%

• pH (791)

Sample solution: Constitute as directed in the labeling.

Acceptance criteria: 5.0–7.5

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Oxacillin Sodium RS

DEFINITION

Oxaliplatin contains NLT 98.0% and NMT 102.0% of oxaliplatin ($C_8H_{14}N_2O_4Pt$), calculated on the dried basis.

[CAUTION—Great care should be taken in handling Oxaliplatin, because it is a potentially cytotoxic agent.]

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

[NOTE—Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the *Sample solution* within 20 min of preparation. Polypropylene HPLC autosampler vials should be used.]

Buffer: Weigh 2.72 g of monobasic potassium phosphate (anhydrous) and 1.80 g of 1-pentanesulfonic acid sodium salt into a suitable container. Add 2000 mL of water, and mix well to completely dissolve all solids. Transfer 0.5 mL of triethylamine to the buffer solution, and mix thoroughly. Adjust the solution by dropwise addition of phosphoric acid to a pH of 4.30 ± 0.05 .

Mobile phase: Methanol and *Buffer* (3:17)

Oxaliplatin standard stock solution: 0.5 mg/mL of USP Oxaliplatin RS in water

Oxaliplatin related compound B standard stock solution: Transfer USP Oxaliplatin Related Compound B RS to a suitable volumetric flask, add 25% of the final volume of methanol, and sonicate for approximately 2 min to disperse the solids. Add approximately 65% of the final volume of 0.001 M nitric acid, and sonicate for an additional 30 min to dissolve the solids. Allow to cool if necessary. Dilute with 0.001 M nitric acid to volume, and mix to obtain a solution having a known concentration of 0.125 mg/mL. [NOTE—USP Oxaliplatin Related Compound B RS is converted to (SP-4-2)-diacqua[(1R, 2R)-cyclohexane-1,2-diamine-N,N']platinum during preparation of this solution.]

Oxaliplatin related compound C standard stock solution: 0.1 mg/mL of USP Oxaliplatin Related Compound C RS in water

System suitability solution: 2 mg/mL of Oxaliplatin in 0.005 M sodium hydroxide. Allow this solution to stand at room temperature for at least 5 days. Transfer 10 mL of this solution, 10 mL of *Oxaliplatin related compound B standard stock solution*, and 5 mL of *Oxaliplatin related compound C standard stock solution* into a 100-mL volumetric flask, and dilute with water to volume. [NOTE—The preparation of the *System suitability solution* forms diquodiaminocyclohexaneplatinum dimer.]

Standard solution: 0.1 mg/mL of USP Oxaliplatin RS in water from *Oxaliplatin standard stock solution*

Sample solution: 0.1 mg/mL of Oxaliplatin in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection volume: 50 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times, measured with respect to oxaliplatin, of oxaliplatin related compound C, oxaliplatin related compound B, and diquodiaminocyclohexaneplatinum dimer are 0.8, 2.7, and 6, respectively.]

Suitability requirements

Resolution: NLT 2.0 between oxaliplatin and oxaliplatin related compound C, *System suitability solution*

Oxaliplatin

$C_8H_{14}N_2O_4Pt$

397.29

[SP-4-2-(1R-trans)]-(1,2-Cyclohexanediamine-N,N')

[ethanedioato(2-)-O,O']platinum;

cis-[(1R,2R)-1,2-Cyclohexanediamine-N,N'] [oxalato(2-)-O,O']platinum [61825-94-3].

Tailing factor: Between 0.8 and 2.0 for oxaliplatin, *System suitability solution*

Relative standard deviation: NMT 2.0% for oxaliplatin, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxaliplatin ($C_8H_{14}N_2O_4Pt$) in the portion of Oxaliplatin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxaliplatin RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxaliplatin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• LIMIT OF SILVER

Sample stock solution: Dissolve 100 mg of Oxaliplatin, weighed, in 50 mL of water to obtain a solution having a concentration of 2 mg/mL.

Sample solution: 1 mg/mL of Oxaliplatin in 0.5 M nitric acid from the *Sample stock solution*

Standard stock solution: Dilute a commercially available silver nitrate atomic absorption standard solution containing 1000 ppm of silver in 0.5 M nitric acid quantitatively, and stepwise if necessary, with 0.5 M nitric acid to obtain a 10-ppb solution.

Standard solution 1: Mix 20 μ L of the *Sample stock solution* and 8 μ L of the *Standard stock solution*, and dilute with 0.5 M nitric acid to 40 μ L.

Standard solution 2: Mix 20 μ L of the *Sample stock solution* and 16 μ L of the *Standard stock solution*, and dilute with 0.5 M nitric acid to 40 μ L.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometer equipped with a silver hollow-cathode lamp and graphite furnace

Analytical wavelength: Silver emission line of 328.1 nm

Blank: 0.5 M nitric acid

Analysis

Samples: *Sample solution*, *Standard solution 1*, and *Standard solution 2*

Plot the absorbances of the *Sample solution*, *Standard solution 1*, and *Standard solution 2* versus their concentrations, in ppb, of silver, and draw the straight line best fitting the three plotted points. The intercept on the x-axis of the extended regression line indicates the silver concentration in the *Sample solution*.

Calculate the concentration of silver, in ppm, in the portion of Oxaliplatin taken:

$$\text{Result} = (C/W) \times 100$$

C = absolute value of the intercept, in ppb of silver, on the x-axis

W = weight of Oxaliplatin taken for the preparation of the *Sample stock solution* (mg)

Acceptance criteria: NMT 5 ppm

Delete the following:

• HEAVY METALS

Standard stock solution: Transfer 1 mL each of 1000-ppm standard solutions of cadmium, chromium, copper, iron, nickel, and lead (commercially available) to a 100-mL volumetric flask. Add 5 mL of nitric acid, and dilute with water to volume.

Internal standard solution: Transfer 1 mL of a 10,000-ppm standard solution of yttrium (commercially available)

to a 100-mL volumetric flask, and dilute with 5% nitric acid to volume.

Standard solutions: Transfer 0.2, 2.0, and 20.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Add 1.0 mL of *Internal standard solution* and 5.0 mL of nitric acid to each flask, and dilute with water to volume. The concentrations of these solutions are 0.02, 0.20, and 2.00 ppm, respectively.

Blank solution: Transfer 1.0 mL of *Internal standard solution* and 5.0 mL of nitric acid to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Weigh 1 g of Oxaliplatin into a 100-mL volumetric flask, and add 80 mL of water. Stir vigorously for several min with a magnetic stirrer until no more sample seems to be dissolving. Add 5 mL of nitric acid, and mix again until the sample is completely dissolved. Remove the stirrer bar from the flask, rinsing it before removal. Add 1.0 mL of the *Internal standard solution*, and dilute with water to volume.

Instrumental conditions

(See *Plasma Spectrochemistry* (730).)

Measure the responses of the elements cadmium, chromium, copper, iron, nickel, lead, and yttrium (internal standard), using an inductively coupled plasma-atomic optical emission spectrometer (ICP-OES), by measuring the emissions at 226.502, 283.563, 327.395, 259.940, 221.648, 220.353, and 371.029 nm, respectively. Optimize the instrument settings as directed by the manufacturer.

System suitability

Before samples are analyzed, the instrument must pass a suitable performance check. Generate the calibration curve, using the *Blank solution* and the *Standard solutions*, and run these solutions in the following order: the *Blank solution*, then the 0.02-, 0.20-, and 2.00-ppm *Standard solutions*. The linear regression coefficient is NLT 0.99; the response of the *Blank solution* is between –5.0 and 5.0 ppb for each element; and the responses of yttrium obtained from the *Standard solutions* are drifted by NMT 5.0% of the response obtained from the *Blank solution*. Run the 0.20-ppm *Standard solution*, and record the responses of each element: the relative standard deviations for replicate runs are NMT 5.0%; and the recovery against the calibration curve is between 95% and 105%. After samples are analyzed, the instrument must pass the same suitable performance check to ensure that the calibration is still valid.

Analysis

Sample: *Sample solution*

Record the responses of each element, and determine the concentration of each element, using the calibration graph. Calculate the content of total elements, in ppm, in the portion of Oxaliplatin taken:

$$\text{Result} = [(\Sigma C)/W] \times 100$$

C_i = concentration of each element in the *Sample solution* (ppm)

W = weight of Oxaliplatin taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 20 ppm • (Official 1-Jan-2018)

• CONTENT OF PLATINUM

Sample: Ignite an empty porcelain crucible fitted with a lid in a furnace at 800° for 30 min. Cool in a desiccator, and weigh. Add 200 mg of the Oxaliplatin, weighed, to the crucible, and ignite in a furnace by stepwise increments as follows. Introduce into the furnace, and increase the temperature to 200° within 15 min, then to 400° within 15 min, then to 600° within 15 min, then finally to 800° within 15 min. Allow to remain in the furnace at 800° for 30 min. Remove, cool in a desiccator, and reweigh.

Calculate the percentage of platinum in the portion of Oxaliplatin taken:

$$\text{Result} = (W_2/W_1) \times 100$$

W_2 = weight of residue after ignition (mg)

W_1 = weight of oxaliplatin before ignition (mg)

Acceptance criteria: 48.1%–50.1% of the oxaliplatin taken, on the dried basis

• **ORGANIC IMPURITIES, PROCEDURE 1: LIMIT OF OXALIC ACID**

[NOTE—Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the *Sample solution* within 20 min of preparation. Polypropylene HPLC autosampler vials should be used.]

Buffer: Add 1.36 g of potassium dihydrogen phosphate to 10 mL of 10% tetrabutylammonium hydroxide in water, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.0.

Mobile phase: Acetonitrile and Buffer (1:4)

Standard stock solution: 0.06 mg/mL of USP Oxaliplatin Related Compound A RS in water

Standard solution: 15 µg/mL of USP Oxaliplatin Related Compound A RS in water from the *Standard stock solution*

System suitability solution: 0.05 mg/mL of sodium nitrate in water. Transfer 2 mL of this solution and 25 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with water to volume.

Sensitivity solution: 1.5 µg/mL of USP Oxaliplatin Related Compound A RS in water from the *Standard solution*

Sample solution: 2 mg/mL of Oxaliplatin in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Any individual unspecified impurity	—	—	0.10
Total impurities ^a	—	—	0.30

^a Total impurities include oxalic acid (from Procedure 1) and all impurities from Procedure 2.

• ORGANIC IMPURITIES, PROCEDURE 3: LIMIT OF OXALIPLATIN RELATED COMPOUND D

[NOTE—Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the *Sample solution* within 20 min of preparation. Polypropylene HPLC autosampler vials should be used.]

Mobile phase: Methanol and ethanol (7:3)

Oxaliplatin related compound D standard stock solution: 0.05 mg/mL of USP Oxaliplatin Related Compound D RS in methanol

Oxaliplatin related compound D standard solution: 15 µg/mL of USP Oxaliplatin Related Compound D RS in methanol from Oxaliplatin related compound D standard stock solution

Oxaliplatin standard stock solution: 0.75 mg/mL of USP Oxaliplatin RS in methanol

Oxaliplatin standard solution: 37.5 µg/mL of USP Oxaliplatin RS in methanol from Oxaliplatin standard stock solution

Oxaliplatin blank solution: Transfer 40 mL of Oxaliplatin standard stock solution to a 50-mL volumetric flask, and dilute with methanol to volume.

Standard solutions: Transfer 40 mL of Oxaliplatin standard stock solution to separate 50-mL volumetric flasks. Add 1.0, 3.0, and 5.0 mL of Oxaliplatin related compound D standard solution to each flask, and dilute with methanol to volume. The concentration of oxaliplatin in these solutions is 0.6 mg/mL. The concentrations of oxaliplatin related compound D in these solutions are 0.3, 0.9, and 1.5 µg/mL, respectively.

System suitability solution: Transfer 5.0 mL of Oxaliplatin standard solution and 4.0 mL of Oxaliplatin related compound D standard stock solution to a 50-mL volumetric flask, and dilute with methanol to volume.

Sample solution: Transfer 30 mg of Oxaliplatin into a 50-mL volumetric flask, and dilute with methanol to volume.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L70

Column temperature: 40°

Flow rate: 0.3 mL/min

Injection volume: 20 µL

Run time: 30 min

System suitability

Samples: 0.9-µg/mL Standard solution and System suitability solution

Suitability requirements

Resolution: NLT 1.5 between oxaliplatin and oxaliplatin related compound D, System suitability solution

Relative standard deviation: NMT 3.0% for the peak height ratio of oxaliplatin related compound D to the sum of oxaliplatin and oxaliplatin related compound D; 0.9-µg/mL Standard solution

Analysis

Samples: Standard solutions and Sample solution

Subtract the oxaliplatin related compound D peak height obtained in the Oxaliplatin blank solution from the oxaliplatin related compound D peak height obtained in the Standard solutions. [NOTE—USP Oxaliplatin RS may contain a small amount of oxaliplatin related compound D.] Plot a calibration curve for the Standard solutions with the peak height ratios of oxaliplatin related compound D to the sum of oxaliplatin and oxaliplatin related compound D on the y-axis and the concentration ratios of oxaliplatin related compound D, in µg/mL, to the sum of oxaliplatin and oxaliplatin related compound D concentrations, in mg/mL, on the x-axis. Read the concentration ratio of oxaliplatin related compound D, in µg/mL, to the sum of oxaliplatin and oxaliplatin related compound D, in mg/mL, in the Sample solution from the calibration curve.

Calculate the percentage of oxaliplatin related compound D in the portion of Oxaliplatin taken:

$$\text{Result} = R/10$$

- R = concentration ratio of oxaliplatin related compound D, in µg/mL, to the sum of oxaliplatin and oxaliplatin related compound D, in mg/mL, in the Sample solution from the calibration curve

Acceptance criteria: NMT 0.1%

SPECIFIC TESTS

• ACIDITY

Sample solution: Dissolve 100 mg in 50 mL of carbon dioxide-free water, and add 0.5 mL of phenolphthalein TS.

Acceptance criteria: The solution is colorless, and NMT 0.6 mL of 0.01 M sodium hydroxide is required to change the color to pink.

• BACTERIAL ENDOTOXINS TEST (85): NMT 1.0 USP Endotoxin Unit/mg of oxaliplatin

• LOSS ON DRYING (731)

Analysis: Dry 1 g at 100°–105° for 2 h.

Acceptance criteria: NMT 0.5%

• MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62): The total aerobic microbial count does not exceed 20 cfu/g, and the total combined molds and yeast count does not exceed 5 cfu/g.

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: 5 mg/mL in water

Acceptance criteria: Between +74.5° and +78.0°, measured at 20°

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers, protected from light. Store at room temperature.

• USP REFERENCE STANDARDS (11)

Oxaliplatin Injection

DEFINITION

Oxaliplatin Injection is a sterile solution of Oxaliplatin in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of oxaliplatin ($C_8H_{14}N_2O_4Pt$).

IDENTIFICATION

• A. ULTRAVIOLET ABSORPTION (197U)

Sample solution: 100 µg/mL

Medium: Water

• B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

[NOTE—All HPLC autosampler vials should be made of polypropylene.]

• PROCEDURE

Acidified water: Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Acidified water* (1:99)

System suitability solution: 0.1 mg/mL of USP Oxaliplatin RS and 0.1 mg/mL of USP Oxaliplatin System

Suitability RS in water. [NOTE—USP Oxaliplatin System Suitability RS is [SP-4-2-(1*R*-trans)]-(1,2-cyclohexanediamine-*N,N'*) dichloridoplatinum(II).]

Standard solution: 0.1 mg/mL of USP Oxaliplatin RS in water

Sample solution: 0.1 mg/mL of oxaliplatin in water, from the combined contents of NLT three vials of Injection

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for USP Oxaliplatin System Suitability RS and oxaliplatin are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between USP Oxaliplatin System Suitability RS and oxaliplatin

Tailing factor: NMT 2.0 for the oxaliplatin peak

Relative standard deviation: NMT 1.0% for the oxaliplatin peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxaliplatin ($C_8H_{14}N_2O_4Pt$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxaliplatin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• LIMIT OF OXALIC ACID

[NOTE—All HPLC autosampler vials should be made of polypropylene.]

Solution A: Dissolve 1.36 g of monobasic potassium phosphate in 10 mL of 10% tetrabutylammonium hydroxide, dilute with water to 1 L, and adjust with phosphoric acid to a pH of 6.0.

Mobile phase: Acetonitrile and *Solution A* (1:4)

Standard solution: 35 µg/mL of USP Oxaliplatin Related Compound A RS in water. [NOTE—USP Oxaliplatin Related Compound A RS is available as dihydrate oxalic acid.]

System suitability solution: 0.1 mg/mL of succinic acid in the *Standard solution*

Sensitivity solution: 3.5 µg/mL of USP Oxaliplatin Related Compound A RS in water from the *Standard solution*

Sample solution: Combined contents of NLT three vials of Injection

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Samples: *Standard solution*, *System suitability solution*, and *Sensitivity solution*

[NOTE—The relative retention times for succinic acid and oxalic acid are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between succinic acid and oxalic acid, *System suitability solution*

Tailing factor: 0.5–2.0 for the oxalic acid peak, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxalic acid in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of oxalic acid from the *Sample solution*

r_S = peak response of oxalic acid from the *Standard solution*

C_S = concentration of USP Oxaliplatin Related Compound A RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous oxalic acid, 90.03

M_{r2} = molecular weight of oxaliplatin related compound A, 126.07

Acceptance criteria: NMT 0.6%

• LIMIT OF (SP-4-2)-DIAQUA[(1R,2R)-CYCLOHEXANE-1,2-DIAMINE-N,N']PLATINUM AND UNSPECIFIED IMPURITIES

[NOTE—All HPLC autosampler vials should be made of polypropylene.]

Solution A: Dissolve 1.36 g of monobasic potassium phosphate and 0.55 g of sodium heptanesulfonate in 1 L of water. Adjust with phosphoric acid to a pH of 3.0.

Solution B: Methanol and *Solution A* (19:81)

Solution C: Methanol and *Solution A* (50.5:49.5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution B (%)	Solution C (%)
0	100	0
45.0	0	100
45.5	100	0
53.0	100	0

System suitability solution: 2 mg/mL of USP Oxaliplatin RS in 0.005 M sodium hydroxide. Allow this solution to stand at room temperature for at least 5 days. Transfer 5 mL of this solution into a 50-mL volumetric flask, and dilute with water to volume. [NOTE—The preparation of the *System suitability solution* forms (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum and diaquodiaminocyclohexaneplatinum dimer.]

Standard stock solution: Transfer a weighed quantity of USP Oxaliplatin Related Compound B RS into a suitable volumetric flask, add a volume of methanol equivalent to about 25% of the final volume, and sonicate for approximately 2 min to disperse the solids. Add a volume of 0.01 M nitric acid equivalent to about 65% of the final volume, and sonicate for approximately 30 min to dissolve. Allow to cool if necessary, and dilute with 0.01 M nitric acid to volume to obtain a solution with a concentration of 0.125 mg/mL.

Standard solution: 31.25 µg/mL of USP Oxaliplatin Related Compound B RS in 0.01 M nitric acid, from the *Standard stock solution*. [NOTE—USP Oxaliplatin Related Compound B RS is converted to (SP-4-2)-diaqua[(1R,

2R)-cyclohexane-1,2-diamine-N,N']platinum in the *Standard solution* preparation.]

Sample solution: Combined contents of NLT three vials of Injection

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 7.5-cm; 3-µm packing L1

Column temperature: 10°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 8.0 between the peaks of (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum and diaquodiaminocyclohexaneplatinum dimer, *System suitability solution*

Tailing factor: NMT 2.0 for the (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum peak, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum from the *Standard solution*

C_S = concentration of USP Oxaliplatin Related Compound B RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum, 345.30

M_{r2} = molecular weight of oxaliplatin related compound B, 433.28

F = relative response factor for each individual impurity (see *Table 2*)

Acceptance criteria

Individual impurities: See *Table 2*.

Total impurities: NMT 2.45%, from *Limit of Oxalic Acid* and *Limit of (SP-4-2)-Diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum and Unspecified Impurities*

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
(SP-4-2)-Diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum	1.0	1.0	0.65
Diaquodiaminocyclohexaneplatinum dimer ^a	1.4	2.5	0.50
Any individual unspecified impurity	—	4.0	0.2

^a (SP-4-2)-Di-µ-oxobis[(1R,2R)-cyclohexane-1,2-diamine-kN,kN']diplatinum.

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 1.0 USP Endotoxin Unit/mg of oxaliplatin.

- **STERILITY TESTS** (71): It meets the requirements when tested as directed for *Membrane Filtration* in the *Test for Sterility of the Product to Be Examined*.
- **PH** (791): 4.0–7.0 using a polymer combination electrode
- **PARTICULATE MATTER IN INJECTIONS** (788): It meets the requirements for small-volume injections.
- **OTHER REQUIREMENTS**: It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature. Do not freeze.
- **LABELING**: Label it to indicate that it is to be diluted with a 5% dextrose solution. Oxaliplatin Injection must not be diluted in sodium chloride solutions or in chloride-containing solutions.
- **USP REFERENCE STANDARDS** (11)
 - USP Endotoxin RS
 - USP Oxaliplatin RS
 - USP Oxaliplatin Related Compound A RS
 - Oxalic acid dihydrate.
 - $C_2H_2O_4 \cdot 2H_2O$ 126.07
 - USP Oxaliplatin Related Compound B RS
 - [SP-4-2-(1*R-trans*)]-(1,2-Cyclohexanediamine-*N,N'*) dinitratoplatinum(II).
 - $C_6H_{14}N_4O_6Pt$ 433.28
 - USP Oxaliplatin System Suitability RS
 - [SP-4-2-(1*R-trans*)]-(1,2-Cyclohexanediamine-*N,N'*) dichloridoplatinum(II).
 - $C_6H_{14}Cl_2N_2Pt$ 380.17

Oxaliplatin for Injection

DEFINITION

Oxaliplatin for Injection is a sterile, lyophilized mixture of Oxaliplatin and Lactose Monohydrate. It contains NLT 90.0% and NMT 110.0% of the labeled amount of oxaliplatin ($C_8H_{14}N_2O_4Pt$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

[NOTE—Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the *Sample solution* within 20 min of preparation. Use polypropylene HPLC autosampler vials.]

Acidified water: Adjust water with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Acidified water* (1:99)

System suitability solution: 0.1 mg/mL each of USP Oxaliplatin RS and USP Oxaliplatin System Suitability RS in water. [NOTE—USP Oxaliplatin System Suitability RS is compound [SP-4-2-(1*R-trans*)]-(1,2-cyclohexanediamine-*N,N'*) dichloridoplatinum(II).]

Standard solution: 0.1 mg/mL of USP Oxaliplatin RS in water

Sample solution: Constitute a suitable number of vials of Oxaliplatin for Injection with the appropriate amount of water to obtain a solution having a known concentration of about 0.1 mg/mL of oxaliplatin, based on the label claim.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection size: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for USP Oxaliplatin System Suitability RS and oxaliplatin are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the peaks of USP Oxaliplatin System Suitability RS and oxaliplatin, *System suitability solution*

Tailing factor: NMT 2.0 for the oxaliplatin peak, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxaliplatin ($C_8H_{14}N_2O_4Pt$) in the portion of Oxaliplatin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxaliplatin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

IMPURITIES

LIMIT OF OXALIC ACID

[NOTE—Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the *Sample solution* within 20 min of preparation. Use polypropylene HPLC autosampler vials.]

Buffer: Add 1.36 g of potassium dihydrogen phosphate to 10 mL of 10% tetrabutylammonium hydroxide in water, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.0.

Mobile phase: Acetonitrile and *Buffer* (1:4)

Standard stock solution: 0.06 mg/mL of USP Oxaliplatin Related Compound A RS in water. [NOTE—USP Oxaliplatin Related Compound A RS is available as oxalic acid dihydrate.]

Standard solution: 15 μg/mL of USP Oxaliplatin Related Compound A RS in water, from the *Standard stock solution*

System suitability stock solution: 0.05 mg/mL of sodium nitrate in water

System suitability solution: 1.0 μg/mL of sodium nitrate and 15 μg/mL of oxaliplatin related compound A in water, from the *System suitability stock solution* and *Standard stock solution*, respectively

Sensitivity solution: Make a 1-to-10 dilution of the *Standard solution* in water.

Sample solution: 2.0 mg/mL of oxaliplatin in water from Oxaliplatin for Injection

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 205 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Column temperature:** 40°**Flow rate:** 2 mL/min**Injection size:** 20 μL**System suitability****Samples:** *Standard solution*, *System suitability solution*, and *Sensitivity solution*

[NOTE—The relative retention times for sodium nitrate and oxalic acid are about 0.6 and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 2.0 between oxalic acid and sodium nitrate, *System suitability solution***Relative standard deviation:** NMT 3.0% for the oxalic acid peak, *Standard solution***Sensitivity:** The signal-to-noise ratio of the peak at approximately the same retention time as that in the *Standard solution* is NLT 10, *Sensitivity solution*.**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of oxalic acid in the portion of Oxaliplatin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

 r_U = peak response of oxalic acid from the *Sample solution* r_S = peak response of oxalic acid from the *Standard solution* C_S = concentration of USP Oxaliplatin Related Compound A RS in the *Standard solution* (mg/mL) C_U = concentration of oxaliplatin in the *Sample solution* (mg/mL) M_{r1} = molecular weight of anhydrous oxalic acid, 90.03 M_{r2} = molecular weight of USP Oxaliplatin Related Compound A RS, 126.07**Acceptance criteria:** NMT 0.5%**• LIMIT OF (SP-4-2)-DIAQUA[(1R,2R)-CYCLOHEXANE-1,2-DIAMINE-N,N']PLATINUM**[NOTE—Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the *Sample solution* within 20 min of preparation. Use polypropylene HPLC autosampler vials.]**Buffer:** Dissolve 1.36 g of potassium dihydrogen phosphate and 1 g of sodium 1-heptanesulfonate in 1 L of water. Adjust with phosphoric acid to a pH of 3.0.**Mobile phase:** Acetonitrile and *Buffer* (1:4)**System suitability solution:** 2 mg/mL of USP Oxaliplatin RS in 0.005 M sodium hydroxide. Allow this solution to stand at room temperature for at least 5 days.[NOTE—Sonicate if necessary.] Transfer 5 mL of this solution into a 50-mL volumetric flask, and dilute with water to volume. [NOTE—The preparation of the *System suitability solution* forms diaquodiaminocyclohexaneplatinum dimer and (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum.]**Standard solution:** Transfer USP Oxaliplatin Related Compound B RS to a suitable volumetric flask, add 25% of the final volume of methanol, and sonicate for approximately 30 min to dissolve. Allow to cool if necessary, and dilute with water to volume to obtain a solution having a known concentration of about 0.0125 mg/mL. [NOTE—When preparing the solution, USP Oxaliplatin Related Compound B RS is converted to (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum.]**Sample solution:** Use the *Sample solution* from the test for *Limit of Oxalic Acid*.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 215 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Column temperature:** 40°**Flow rate:** 2 mL/min**Injection size:** 20 μL**System suitability****Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum and diaquodiaminocyclohexaneplatinum dimer are about 1.0 and 1.5, respectively.]

Suitability requirements**Resolution:** NLT 2.0 between (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N']platinum and diaquodiaminocyclohexaneplatinum dimer, *System suitability solution***Relative standard deviation:** NMT 3.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*

Suitability requirements

Resolution: NLT 2.0 between [SP-4-2-(1*R-trans*)]-(1,2-cyclohexanediamine-*N,N'*) dichloridoplatinum(II) and oxaliplatin, *System suitability solution*

Tailing factor: NMT 2.0 for the oxaliplatin peak, *System suitability solution*

Relative standard deviation: NMT 3.0% each for the oxaliplatin and oxaliplatin related compound C peaks, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of oxaliplatin related compound C in the portion of Oxaliplatin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of oxaliplatin related compound C from the *Sample solution*

r_S = peak response of oxaliplatin related compound C from the *Standard solution*

C_S = concentration of USP Oxaliplatin Related Compound C RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified impurity in the portion of Oxaliplatin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of oxaliplatin from the *Standard solution*

C_S = concentration of USP Oxaliplatin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Oxaliplatin related compound C ^a	0.6	0.3
[SP-4-2-(1 <i>R-trans</i>)]-(1,2-Cyclohexanediamine- <i>N,N'</i>) dichloridoplatinum(II) ^b	0.8	—
Oxaliplatin	1.0	—
Any individual unspecified impurity	—	0.2
Total impurities ^c	—	1.5

^a [1*R-trans*-(1,2-Cyclohexanediamine-*N,N'*)]-*trans*-dihydroxido-[oxalato(2-)-O,O']platinum(IV).

^b The relative retention time of [SP-4-2-(1*R-trans*)]-(1,2-cyclohexanediamine-*N,N'*) dichloridoplatinum(II) has been included for system suitability purposes only.

^c Includes oxalic acid, (SP-4-2)-diaqua[(1*R,2R*)-cyclohexane-1,2-diamine-*N,N'*]platinum, oxaliplatin related compound C, and the total of the individual unspecified impurities.

SPECIFIC TESTS

- PH (791):** 4.0–7.0 using a polymer combination electrode, determined in a solution constituted as directed in the labeling
- PARTICULATE MATTER IN INJECTIONS (788):** It meets the requirements for small-volume injections.
- CONSTITUTED SOLUTION:** At the time of use, it meets the requirements under *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

- BACTERIAL ENDOTOXINS TEST (85):** NMT 1.0 USP Endotoxin Unit/mg of oxaliplatin
- STERILITY TESTS (71):** Meets the requirements
- WATER DETERMINATION, Method 1 (921):** NMT 4.0%
- OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS**Change to read:**

- PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017). Store at controlled room temperature.
- LABELING:** Label it to indicate that it is to be diluted with a suitable parenteral vehicle before intravenous infusion.

Oxandrolone

C₁₉H₃₀O₃ 306.44

2-Oxaandrostan-3-one, 17-hydroxy-17-methyl-, (5α,17β)-17β-Hydroxy-17-methyl-2-oxa-5α-androstan-3-one [53-39-4].

» Oxandrolone contains not less than 98.0 percent and not more than 102.0 percent of C₁₉H₃₀O₃, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

- USP Oxandrolone RS
- USP Oxandrolone Related Compound A RS (7,8-Didehydro-oxandrolone) or (17β-hydroxy-17α-methyl-2-oxa-5α-androst-7-en-3-one).
- USP Oxandrolone Related Compound B RS (4-Oxa-isomer) or (17β-hydroxy-17α-methyl-4-oxa-5α-androstan-3-one).
- USP Oxandrolone Related Compound C RS Anhydro-oxandrolone or (17,17-dimethyl-18-nor-2-oxa-5α-androst-13-en-3-one).

Identification—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Specific rotation (781S): between -18° and -24° .

Test solution: 10 mg per mL, in chloroform.

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.2%.

Related compounds—

Solution A: acetonitrile.

Solution B: water.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Blank solution—Prepare a mixture of *Solution A* and *Solution B* (50:50).

Standard stock solution—Dissolve accurately weighed quantities of USP Oxandrolone Related Compound A RS, USP Oxandrolone Related Compound B RS, USP Oxandrolone Related Compound C RS, and USP Oxandrolone RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having known concentrations of about 4 μg of USP Oxandrolone Related Compound A RS per mL, 120 μg of USP Oxandrolone Related Compound B RS per mL, 4 μg of USP Oxandrolone Related Compound C RS per mL, and 200 μg of USP Oxandrolone RS per mL. [NOTE—Sonicate if necessary to dissolve.]

Standard solution—Dilute 1.0 mL of the *Standard stock solution* with 4.0 mL of acetonitrile and 5.0 mL of water, and mix.

Test solution—Weigh accurately 40 mg of Oxandrolone into a 10-mL volumetric flask, dissolve in 5.0 mL of acetonitrile using an ultrasonic bath, dilute with water to volume, and mix. [NOTE—The *Test solution*, the *Standard solution*, and the *Blank solution* are made up fresh and injected immediately.]

Chromatographic system—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm \times 25-cm column that contains 5- μm packing L1. The column temperature is maintained at 40° . The flow rate is about 0.7 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	50	50	equilibration
0–30	50→100	50→0	linear gradient
30–32	100→50	0→50	linear gradient
32–40	50	50	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between oxandrolone related compound A and oxandrolone related compound B is not less than 1.5, and the resolution, R , between oxandrolone related compound B and oxandrolone is not less than 2.0; the tailing factor is not more

than 1.5; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 μL) of the *Blank solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of oxandrolone related compound A in the portion of Oxandrolone taken by the formula:

$$(C/W)(r_U / r_S)$$

in which C is the concentration, in μg per mL, of oxandrolone related compound A in the *Standard solution*; W is the weight, in mg, of Oxandrolone taken to prepare the *Test solution*; r_U is the peak area of oxandrolone related compound A in the chromatogram of the *Test solution*; and r_S is the peak area obtained for oxandrolone related compound A in the chromatogram of the *Standard solution*.

Calculate the percentage of oxandrolone related compound C, methyltestosterone, $\Delta 1$ -mestalone, specified unknown impurity 1, and each impurity eluting at a relative retention time greater than or equal to 2.2 (relative to retention time of oxandrolone) by the formula:

$$(1/F)(C/W)(r_U / r_S)$$

in which F is the relative response factor (see accompanying table for values); C is the concentration, in μg per mL, of oxandrolone related compound C in the *Standard solution*; W is the weight, in mg, of Oxandrolone taken to prepare the *Test solution*; r_U is the peak area of oxandrolone related compound C, methyltestosterone, $\Delta 1$ -mestalone, specified unknown impurity 1, or each impurity eluting at a relative retention time greater than or equal to 2.2 in the chromatogram of the *Test solution*; and r_S is the peak area obtained for oxandrolone related compound C in the chromatogram of the *Standard solution*.

Calculate the percentage of each impurity, except oxandrolone related compound A, oxandrolone related compound C, methyltestosterone, $\Delta 1$ -mestalone, specified unknown impurity 1, and other impurities eluting at relative retention times greater than or equal to 2.2 by the formula:

$$(1/F)(C/W)(r_U / r_S)$$

in which F is the relative response factor for each impurity (see accompanying table for values); C is the concentration, in μg per mL, of USP Oxandrolone RS in the *Standard solution*; W is the weight, in mg, of Oxandrolone taken to prepare the *Test solution*; r_U is the peak area of each impurity, in the chromatogram of the *Test solution*, other than peak areas of oxandrolone related compound A, oxandrolone related compound C, methyltestosterone, $\Delta 1$ -mestalone, specified unknown impurity 1, and other impurities eluting at relative retention times greater than or equal to 2.2; and r_S is the peak area obtained for oxandrolone in *Standard solution*. Disregard any peak observed in the chromatogram obtained from the *Blank solution*. Disregard any impurity peak that is less than 0.05%. The impurities meet the requirements specified in the accompanying table.

Compound	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Secodicarboxylic acid ¹	0.46	4.1	0.1
7,8-Didehydro-oxandrolone ² (Oxandrolone related compound A)	0.90	—	0.1
4-Oxa-isomer ³ (Oxandrolone related compound B)	0.94	1.4	0.3

¹¹ 17,17-Dimethyl-18-nor-2-oxa-5 α -andro-13-en-3-one.

^a F values relative to oxandrolone related compound C.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Oxandrolone RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 3 mg per mL. [NOTE—Sonicate if necessary to dissolve.]

Assay preparation—Transfer to a suitable volumetric flask an accurately weighed quantity of Oxandrolone, and dissolve in and dilute with acetonitrile to volume to obtain a solution having a concentration of about 3 mg per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm \times 25-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of C₁₉H₃₀O₃ in the portion of Oxandrolone taken by the formula:

$$VC(r_u / r_s)$$

in which V is the final volume, in mL, of the *Assay preparation*; C is the concentration, in mg per mL, of USP Oxandrolone RS in the *Standard preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Oxandrolone Tablets

» Oxandrolone Tablets contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of oxandrolone (C₁₉H₃₀O₃).

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.

USP Reference standards (11)—

USP Oxandrolone RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

Standard solution: 5 mg per mL in chloroform.

Test solution—Transfer a portion of finely powdered Tablets, equivalent to about 20 mg of oxandrolone, to a 50-mL stoppered centrifuge tube, add 4 mL of chloroform, shake by mechanical means for 10 minutes, centrifuge for about 15 minutes, and filter a portion of the chloroform layer.

Application volume: 10 μ L.

Developing solvent system: a mixture of chloroform and methanol (19:1).

Procedure—Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear: the R_f value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Change to read:

Dissolution (711)—

TEST 1—

Medium: a solution of water and isopropanol (7:3); 500 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

Determine the amount of C₁₉H₃₀O₃ dissolved by employing the following method.

Internal standard solution—Dissolve accurately weighed quantities of 17 α -methyltestosterone, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 0.2 mg per mL (for Tablets with a 2.5-mg label claim) and about 0.8 mg per mL (for Tablets with a 10-mg label claim).

Standard solution—Dissolve an accurately weighed quantity of USP Oxandrolone RS, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a concentration of about 1 mg per mL.

Working standard solution—For Tablets labeled to contain 2.5 mg: combine 100 μ L of the *Standard solution*, 400 μ L of the *Internal standard solution*, and 1500 μ L of acetonitrile. For Tablets labeled to contain 10 mg: combine 100 μ L of the *Standard solution*, 100 μ L of the *Internal standard solution*, and 1800 μ L of acetonitrile.

Test solution—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45- μ m polytetrafluoroethylene filter. Transfer 20 mL of the filtrate to a separatory funnel, add 400 μ L of the *Internal standard solution*, 40 mL of a 10% potassium chloride solution, and 8 mL of chloroform. In separate separatory funnels, prepare an extraction blank and an internal standard blank in a similar manner using 20 mL of filtered *Medium* in place of the solution under test and excluding the *Internal standard solution* from the extraction blank. Shake each funnel, and allow the layers to separate. Collect the lower chloroform layer. Repeat the extraction procedure one more time. Evaporate the solvents under a stream of nitrogen at 45° until just dry. Reconstitute the dried residue with 2 mL of acetonitrile (for Tablets with a 2.5-mg label claim) or with 8 mL of acetonitrile (for Tablets with a 10-mg label claim), and sonicate for 10 minutes.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm \times 30-m column coated with a 0.5- μ m phase G27. The carrier gas is helium, flowing at a rate of about 16.8 mL per minute. The injection port and detector temperatures are maintained at 190° and 320°, respectively. The chromatograph is programmed as follows. The column temperature is initially 180°. Upon injection, the column temperature is increased at a rate of 25° per minute to 280°, and maintained at 280° for 3 minutes. Then the column temperature is increased at a rate of 10° per minute to 320°, and maintained at 320° for 3 minutes. Chromatograph the acetonitrile, the extraction blank, and the internal standard blank, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5. Make two injections of the *Working standard solution*, and record the peak responses. The average oxandrolone/*Internal standard solution* peak area percent comparison is between 98.0% and 102.0%. The resolution, *R*, between the oxandrolone peak and the nearest eluting peak is equal to or greater than 1.5.

Procedure—Separately inject equal volumes (0.5 μ L) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{C_s \times \text{sample ratio} \times V_{UF} \times 500 \times 100}{\text{Standard ratio} \times V_{UI} \times LC}$$

in which C_s is the concentration, in mg per mL, of oxandrolone in the *Standard solution*; sample ratio is the area ratio of oxandrolone to 17 α -methyltestosterone in the sample injection for each *Test solution*; V_{UF} is the final volume, in mL, of the sample after reconstitution of the dry residue; 500 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; standard ratio is the mean area ratio of oxandrolone to 17 α -methyltestosterone in all injections of the *Standard solution*; V_{UI} is the initial sample volume, in mL, used in the extraction; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 75% (*Q*) of the labeled amount of oxandrolone ($C_{19}H_{30}O_3$) is dissolved in 60 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets *USP Dissolution Test 2*.

Medium: 1% polysorbate 80 in water; 500 mL, deaerated.

Apparatus 2: 100 rpm.

Time: 120 minutes.

Determine the amount of $C_{19}H_{30}O_3$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard stock solution—Transfer about 20 mg of USP Oxandrolone RS, accurately weighed, to a 200-mL volumetric flask. Add about 20 mL of acetonitrile, and sonicate to dissolve. Dilute with *Medium* to volume, and mix.

Working standard solution—Quantitatively dilute the *Standard stock solution* with *Medium* to obtain a solution having a final concentration of about 5 μ g per mL for Tablets with a label claim of 2.5 mg, or a final concentration of about 20 μ g per mL for Tablets with a label claim of 10 mg.

Test solution—Withdraw about 10 mL of the solution under test from the vessel. Centrifuge in a glass tube at 2000 rpm for 10 minutes.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L1. The column is maintained at 30°, and the detector is maintained at 50°. The flow rate is about 1.5 mL per minute. Chromatograph the *Working standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; the column efficiency is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 100 μ L) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{19}H_{30}O_3$ released by the formula:

$$\frac{r_U \times C_s \times D \times 500 \times 100}{r_s \times LC}$$

in which r_U and r_s are the peak responses obtained from the *Test solution* and *Working standard solution*, respectively; C_s is the concentration, in mg per mL, of the *Working standard solution*; *D* is the dilution factor of the *Test solution*; 500 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 65% (*Q*) of the labeled amount of $C_{19}H_{30}O_3$ is dissolved in 120 minutes.

TEST 3—If the product complies with this test, the labeling indicates that it meets *USP Dissolution Test 3*.

Medium: 0.1 N hydrochloric acid containing 0.75% of sodium lauryl sulfate; 500 mL for Tablets labeled to contain 2.5 mg, 900 mL for Tablets labeled to contain 10 mg, deaerated with helium.

Apparatus 2: 75 rpm.

Time: 90 minutes.

Determine the amount of $C_{19}H_{30}O_3$ released by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard stock solution—Transfer about 20 mg, accurately weighed, of USP Oxandrolone RS to a 100-mL volumetric flask. Dissolve in approximately 5 mL of acetonitrile, and sonicate for 10 minutes. Dilute with *Medium* to volume, and mix.

Working standard solution—Transfer 8.0 mL of the *Standard stock solution* to a 200-mL volumetric flask, dilute with *Medium* to volume, and mix.

Test solution—Pass the solution under test through a suitable filter having a porosity of 0.45 μ m.

Chromatographic system—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 3-cm column (ERR 1-Jun-2016) that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. The temperatures of the detector and the column are both maintained at 35°. Chromatograph the *Working standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 200 μL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of C₁₉H₃₀O₃ dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses for the *Test solution* and the *Working standard solution*, respectively; C_S is the concentration, in mg per mL, of oxandrolone in the *Working standard solution*; 500 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and LC is the Tablet label claim, in mg.

Tolerances—Not less than 75% (Q) of the labeled amount of C₁₉H₃₀O₃ is dissolved in 90 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (62:38). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluent—Prepare a mixture of water and acetonitrile (1:1).

Standard preparation—Dissolve an accurately weighed quantity of USP Oxandrolone RS in *Diluent*, and dilute with *Diluent* to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of oxandrolone, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, sonicate for 30 minutes with frequent shaking, and shake for an additional 15 minutes using a mechanical shaker. Dilute with *Diluent* to volume, and centrifuge. Use the supernatant as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The column is maintained at 30°, and the detector is maintained at 50°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; the column efficiency is not less than 5000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the oxandrolone peaks. Calculate the quantity, in percent of label claim, of oxandrolone (C₁₉H₃₀O₃) in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of oxandrolone in the *Standard preparation*; C_U is the concentration, in mg per mL, of oxandrolone in the *Assay preparation*, based on the label claim; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Oxaprozin

C₁₈H₁₅NO₃ 293.32
2-Oxazolepropanoic acid, 4,5-diphenyl-;
4,5-Diphenyl-2-oxazolepropionic acid [21256-18-8].

DEFINITION

Oxaprozin contains NLT 98.0% and NMT 102.0% of oxaprozin (C₁₈H₁₅NO₃), calculated on the dried basis.

[NOTE—Because of light sensitivity, protect all oxaprozin samples and standard solutions from light.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Previously dried at 105° for 2 h
- **B.** The retention time of the oxaprozin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 0.1% phosphoric acid, pH 2.0 ± 0.1

Mobile phase: *Solution A* and acetonitrile (550:450)

Standard solution: 0.2 mg/mL of USP Oxaprozin RS in acetonitrile

Sample solution: 0.2 mg/mL of Oxaprozin in acetonitrile

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 25°

Flow rate: 1.0 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxaprozin (C₁₈H₁₅NO₃), in the portion of Oxaprozin taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response of oxaprozin from the *Sample solution*

r_S = peak response of oxaprozin from the *Standard solution*

C_S = concentration of USP Oxaprozin RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxaprozin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%
- **ARSENIC, Method II** (211): NMT 1 ppm

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 ppm (Official 1-Jan-2018)

• **ORGANIC IMPURITIES**

Solution A: 0.1% phosphoric acid adjusted with phosphoric acid to a pH of 2.00 ± 0.1

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
20	70	30
21	70	30
60	0	100
61	70	30
70	70	30

Diluent A: Acetonitrile, methylene chloride, and water (48:1:1)

Diluent B: Acetonitrile and water (1:1)

Standard stock solution: 200 µg/mL of USP Oxaprozin RS in acetonitrile

Standard solution: 5 µg/mL of USP Oxaprozin RS in Diluent A from the Standard stock solution

System suitability stock solution: 200 µg/mL of benzil in acetonitrile

System suitability solution: 10 µg/mL each of benzil and USP Oxaprozin RS in Diluent A from the System suitability stock solution and Standard stock solution, respectively

Sample solution A: 1 mg/mL of Oxaprozin prepared as follows. Transfer about 100 mg of Oxaprozin to a 100-mL volumetric flask. Add 2 mL of methylene chloride, 2 mL of water, and 75 mL of acetonitrile. Sonicate after each solvent is added. Dilute with acetonitrile to volume. [NOTE—This is used to monitor all known and unknown impurities, except imidazolic acid and oximide.]

Sample solution B: 1 mg/mL of Oxaprozin in Diluent B. [NOTE—This is used to monitor only imidazolic acid and oximide.]

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 238 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Samples: Standard solution and System suitability solution

[NOTE—The relative retention times for oxaprozin and benzil are about 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 3.0 between oxaprozin and benzil, System suitability solution

Tailing factor: NMT 2.0, Standard solution

Relative standard deviation: NMT 5.0%, Standard solution

Analysis

Samples: Sample solution A and Sample solution B
Calculate the percentage of imidazolic acid and oximide in the portion of Oxaprozin taken:

$$\text{Result} = (r_U/r_T) \times F \times 100$$

r_U = peak areas of imidazolic acid or oximide from Sample solution B

r_T = sum of the peak areas from Sample solution B

F = relative response factor (see Table 2)

Calculate the percentage of any other impurity in the portion of Oxaprozin taken:

$$\text{Result} = (r_U/r_T) \times F \times 100$$

r_U = peak area of each other impurity from Sample solution A

r_T = sum of the peak areas from Sample solution A

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Imidazolic acid	0.14	1.15	0.1
Unidentified impurity 1	0.42	1.21	0.1
Oximide	0.73	0.91	0.1
Unidentified impurity 2	0.84	0.85	0.1
Unidentified impurity 3	1.08	1.29	0.1
Unidentified impurity 4	1.50	1.46	0.1
Unidentified impurity 5	1.57	2.09	0.1
Total impurities	—	—	0.5

[NOTE—The values of F for all known impurities, except imidazolic acid and oximide, are found using Sample solution A. The values of F for imidazolic acid and oximide are found using Sample solution B.]

SPECIFIC TESTS• **LOSS ON DRYING (731)**

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 0.3%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Oxaprozin RS

Oxaprozin Tablets**DEFINITION**

Oxaprozin Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of oxaprozin ($C_{18}H_{15}NO_3$).

[NOTE—Because of light sensitivity, protect all oxaprozin samples and standard solutions from light.]

IDENTIFICATION• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Sample solution: 2 mg/mL of oxaprozin in acetone

Developing solvent system: Ethyl acetate and glacial acetic acid (99:1)

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY• **PROCEDURE**

Solution A: 0.1% Phosphoric acid. Add phosphoric acid, dropwise, to water to obtain a pH of 2.00 ± 0.10 .

Mobile phase: Acetonitrile and Solution A (45:55)

Standard solution: Dissolve an accurately weighed quantity of USP Oxaprozin RS in acetonitrile to obtain a solution having a concentration of about 12 µg/mL of oxaprozin.

Sample stock solution: Nominally 0.6 mg/mL of oxaprozin prepared as follows. Transfer a suitable amount of oxaprozin from NLT 20 powdered Tablets to an appropriate volumetric flask. Add water to 10% of the final volume, and sonicate for 10 min. Add 40% of the final volume of acetonitrile, and sonicate for 30 min. Shake by mechanical means for an additional 30 min.

Add 30% of the final volume of acetonitrile, and sonicate for 10 min. Dilute with acetonitrile to volume. Pass through a suitable filter. Use the filtrate.

Sample solution: Nominally equivalent to 12 µg/mL of oxaprozin from the *Sample stock solution* in acetonitrile

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxaprozin (C₁₈H₁₅NO₃) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Oxaprozin RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of oxaprozin in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.05 M monobasic potassium phosphate buffer, pH 7.4; 1000 mL

Apparatus 2: 75 rpm

Time: 45 min

Detector: UV 286 nm (maximum absorbance)

Standard solution: A known concentration of USP Oxaprozin RS in *Medium*. [NOTE—A quantity of methanol, not exceeding 5% of the final volume, can be added to help solubilize the USP Reference Standard.]

Sample solution: Filter portions of the solution under test, suitably diluted with *Medium*, if necessary.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxaprozin (C₁₈H₁₅NO₃) dissolved by using UV absorption from the *Sample solution* in comparison with the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of oxaprozin (C₁₈H₁₅NO₃) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solution A and Mobile phase: Proceed as directed in the Assay.

Standard solution: 0.001 mg/mL of USP Oxaprozin RS in acetonitrile

Sample solution: Nominally 1 mg/mL of oxaprozin prepared as follows. Transfer a suitable amount of oxaprozin from NLT 20 powdered Tablets to an appropriate volumetric flask. Add water to 10% of the final volume, and sonicate for 10 min. Add 40% of the final volume of acetonitrile, and sonicate for 30 min. Shake by mechanical means for an additional 30 min. Add 30% of the final volume of acetonitrile, and sonicate for 10 min. Dilute with acetonitrile to volume. Pass through a suitable filter. Use the filtrate.

Chromatographic system: Proceed as directed in the Assay except use a column temperature of 20°.

USP Oxaprozin RS

Oxazepam

C₁₅H₁₁ClN₂O₂ 286.71

2H-1,4-Benzodiazepin-2-one, 7-chloro-1,3-dihydro-3-hydroxy-5-phenyl-, (±)-;

(±)-7-Chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one [604-75-1].

DEFINITION

Oxazepam contains NLT 98.0% and NMT 102.0% of oxazepam (C₁₅H₁₁ClN₂O₂), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION (197K)**• **B. ULTRAVIOLET ABSORPTION (197U)**

Sample solution: 4 µg/mL in alcohol

Analytical wavelength: 229 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, differ by NMT 3.0%.

ASSAY• **PROCEDURE**

Sample solution: Transfer about 400 mg of Oxazepam, accurately weighed, to a beaker, and dissolve in 100 mL of dimethylformamide.

Analysis: Titrate the Sample solution with 0.1 N tetrabutylammonium hydroxide VS. Determine the endpoint potentiometrically, using a calomel-glass electrode system and taking precautions against absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 28.67 mg of oxazepam ($C_{15}H_{11}ClN_2O_2$).

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES• **RESIDUE ON IGNITION (281):** NMT 0.3%• **ORGANIC IMPURITIES**

Prepare the solutions immediately before use.

Diluent: Acetonitrile and water (50:50)

Solution A: Dissolve 3.5 g of dipotassium hydrogen phosphate in 900 mL of water. Adjust with 1 N sodium hydroxide to a pH of 10.5, and dilute with water to 1 L.

Solution B: Acetonitrile

Mobile phase: See Table 1.

Samples: System suitability solution and Standard solution

Suitability requirements

Resolution: NLT 1.5 between chlordiazepoxide related compound A and oxazepam related compound A, System suitability solution

Relative standard deviation: NMT 5.0%, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Oxazepam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

 r_U = peak area of any impurity from the Sample solution r_S = peak area of oxazepam from the Standard solution C_S = concentration of USP Oxazepam RS in the Standard solution (mg/mL) C_U = concentration of oxazepam in the Sample solution (mg/mL) F = relative response factor, see Table 2

Acceptance criteria: See Table 2. Disregard any peak representing less than 0.05% of the area of the main peak.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of oxazepam from the *Standard solution*

C_S = concentration of USP Oxazepam RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of oxazepam in the *Sample solution* (μ g/mL)

Acceptance criteria

Individual impurities: See Impurity Table 1. [NOTE—Disregard peaks less than 0.05%.]

Total impurities: NMT 0.5%, not including 2-amino 5-chlorobenzophenone

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Oxazepam	1.0	—
2-Amino 5-chlorobenzophenone	2.7	0.5
Any individual unspecified degradation product	—	0.1

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**
USP Oxazepam RS

Oxazepam Tablets

DEFINITION

Oxazepam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxazepam ($C_{15}H_{11}ClN_2O_2$).

IDENTIFICATION

- **A.** The *Sample solution* in the Assay exhibits a maximum absorbance at 229 ± 2 nm.

ASSAY

• PROCEDURE

Standard solution: 4 µg/mL of USP Oxazepam RS in alcohol

Sample stock solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, nominally equivalent to 50 mg of oxazepam, to a medium-pore size, sintered-glass funnel that is fitted into a small suction flask. Add 25 mL of alcohol, mix with the aid of a stirring rod, and after about 5 min apply gentle suction to remove the extract. Repeat the extraction with four additional 25-mL portions of alcohol, transfer the extracts to a 250-mL volumetric flask, and dilute with alcohol to volume.

Sample solution: Dilute 2.0 mL of *Sample stock solution* with alcohol to 100 mL.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 229 nm

Cell: 1 cm

Blank: Alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxazepam ($C_{15}H_{11}ClN_2O_2$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Oxazepam RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of oxazepam in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 1000 mL

Apparatus 2: 50 rpm

Time: 60 min

Mobile phase: Methanol, glacial acetic acid, and water (60:1:40)

Sample solution: Pass a portion of the solution under test through a suitable filter.

Standard solution: Prepare a known concentration of USP Oxazepam RS in *Medium* at a known concentration similar to the *Sample solution*. [NOTE—A volume of alcohol not to exceed 10% of the final total volume may be used to dissolve USP Oxazepam RS.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 232 nm

Column: 4-mm × 30-cm; packing L7

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxazepam ($C_{15}H_{11}ClN_2O_2$) dissolved, using the peak response of oxazepam from the *Sample solution* in comparison to that from the *Standard solution*.

Tolerances: NLT 80% (Q) of the labeled amount of oxazepam ($C_{15}H_{11}ClN_2O_2$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**
USP Oxazepam RS

Oxcarbazepine

$C_{15}H_{12}N_2O_2$ 252.27
5*H*-Dibenz[*b,f*]azepine-5-carboxamide, 10,11-dihydro-10-oxo-;
10,11-Dihydro-10-oxo-5*H*-dibenz[*b,f*]azepine-5-carboxamide
[28721-07-5].

DEFINITION

Oxcarbazepine contains NLT 98.0% and NMT 102.0% of oxcarbazepine ($C_{15}H_{12}N_2O_2$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

[NOTE—If the spectrum obtained shows differences, dissolve the substance to be examined in chloroform, and evaporate to dryness. Compare the spectrum of the residue to that of a similarly prepared USP Oxcarbazepine RS.]

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: 6.8 g/L of monobasic potassium phosphate in water. For each liter prepared, add 2 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 6.0 ± 0.1 .

Mobile phase: Methanol, acetonitrile, and *Buffer* (11:8:31)

Standard solution: 0.1 mg/mL of USP Oxcarbazepine RS in *Mobile phase*

Sample solution: 0.1 mg/mL of Oxcarbazepine in *Mobile phase*

Oxcarbazepine Oral Suspension**DEFINITION**

Oxcarbazepine Oral Suspension contains NLT 95.0% and NMT 105.0% of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂).

IDENTIFICATION

- **A.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Protect all solutions from light.

Buffer: Dissolve 1.36 g of sodium acetate trihydrate and 0.6 g of glacial acetic acid in 1 L of water. Adjust with glacial acetic acid to a pH of 4.4.

Solution A: Acetonitrile, tetrahydrofuran, *tert*-butyl methyl ether, and *Buffer* (130:30:9:830)

Solution B: Acetonitrile, tetrahydrofuran, *tert*-butyl methyl ether, and *Buffer* (670:30:9:290)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	93	7
2	90	10
10	90	10
25	10	90
26	93	7
35	93	7

Diluent: Dissolve 0.1 g of ascorbic acid and 1 mL of acetonitrile in 1 L of water.

Standard stock solution: 1 mg/mL of USP Oxcarbazepine RS in acetonitrile. Sonicate to aid in dissolution.

Standard solution: 0.25 mg/mL of USP Oxcarbazepine RS from the *Standard stock solution*, prepared as follows. Dilute a suitable volume of the *Standard stock solution* first in *Diluent*, using 70% final volume. Allow the solution to equilibrate to room temperature, and dilute with acetonitrile to volume.

Sample solution: 0.25 mg/mL of oxcarbazepine from a portion of Oral Suspension, prepared as follows. Dissolve first in *Diluent* using 8% of final volume, fill 30% of final volume with acetonitrile. Sonicate for 15 min. Add *Diluent* to fill 36% of final volume. Shake the flask

vigorously. Allow the solution to equilibrate to room temperature, and dilute with *Diluent* to volume.

System suitability stock solution: 0.01 mg/mL of USP Oxcarbazepine Related Compound A RS and 0.02 mg/mL of USP Oxcarbazepine Related Compound C RS in acetonitrile

System suitability solution: 0.5 µg/mL of USP Oxcarbazepine Related Compound A RS and 1 µg/mL of USP Oxcarbazepine Related Compound C RS from the *System suitability stock solution*, in *Standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.0-mm × 25-cm; 3-µm packing L1

Column temperature: 50°

Flow rate: 0.6 mL/min

Injection volume: 5 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—Refer to *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.3 between oxcarbazepine related compound C and oxcarbazepine related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of oxcarbazepine from the *Sample solution*

r_S = peak response of oxcarbazepine from the *Standard solution*

C_S = concentration of USP Oxcarbazepine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxcarbazepine in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 1% sodium dodecyl sulfate in water; 890 mL

Apparatus 2: 75 rpm

Time: 30 min

Analysis: Shake manually a bottle of Oral Suspension for about 20 s. Using a 10-mL syringe, draw 10.0 mL of the Oral Suspension. Attach a long needle to the syringe. Deliver carefully 10.0 mL of Oral Suspension through the needle to the bottom of the vessel containing preheated *Medium*. Take about 10 mL of the *Medium* from the vessel to clean the syringe, and transfer it back to the vessel. Start the paddle rotation immediately after introduction of each sample.

Mobile phase: Methanol, acetic acid, and water (24:1:75)

Standard solution: 0.7 mg/mL of USP Oxcarbazepine RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 1-µm pore size, discard the first few mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 310 nm

Column: 4.6-mm × 25-cm; 10-µm packing L10

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxcarbazepine RS in the *Standard solution* (mg/mL)

L = label claim (mg in 10 mL)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂) is dissolved.

• **DELIVERABLE VOLUME** (698): Meets the requirements

IMPURITIES

• ORGANIC IMPURITIES

Protect all solutions from light.

Solution A, Solution B, Mobile phase, Diluent, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution: 0.5 mg/mL of USP Carbamazepine RS in acetonitrile. Sonicate to aid in dissolution.

Standard solution: 0.5 µg/mL of USP Carbamazepine RS from the *Standard stock solution* prepared as follows. Dilute a volume of the *Standard stock solution* first in *Diluent*, using 70% of final volume. Cool to room temperature, and dilute with acetonitrile to volume.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.3 between oxcarbazepine related compound C and oxcarbazepine related compound A peaks, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of carbamazepine from the *Standard solution*

C_S = concentration of USP Carbamazepine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxcarbazepine in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

USP Carbamazepine RS

USP Oxcarbazepine RS

USP Oxcarbazepine Related Compound A RS

N-Formyl-10-oxo-10,11-dihydro-5*H*-dibenzo[*b,f*]azepine-5-carboxamide.C₁₆H₁₂N₂O₃ 280.28

USP Oxcarbazepine Related Compound C RS

Acridin-9(10*H*)-one.C₁₃H₉NO 195.22**Oxcarbazepine Tablets****DEFINITION**Oxcarbazepine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂).**IDENTIFICATION**• **A. INFRARED ABSORPTION (197K)**

Sample: Weigh about 840 mg of crushed Tablet powder, and add to a 50-mL volumetric flask. Add 45 mL of chloroform, and shake the flask for 30 min on a mechanical shaker. Add chloroform to volume, centrifuge, and collect the supernatant in a Petri dish. Evaporate the supernatant on a water bath at 60°. Dry the residue, and crush the residue thoroughly with potassium bromide in the ratio of 1:100.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Add 2 mL of triethylamine. Adjust with phosphoric acid to a pH of 6.0.

Diluent: Methanol and water (80:20)

Mobile phase: Methanol, acetonitrile, and *Buffer* (22:16:62)

Standard stock solution: 0.5 mg/mL of USP Oxcarbazepine RS in *Diluent*. Sonication may be used to aid in dissolution.

Standard solution: 0.1 mg/mL of USP Oxcarbazepine RS in *Mobile phase* from the *Standard stock solution*

Sample stock solution: Nominally equivalent to 1.2 mg/mL of oxcarbazepine from a portion of finely powdered (NLT 20) Tablets, prepared as follows. Transfer a weighed quantity of powdered Tablets, equivalent to 600 mg of oxcarbazepine, to a 500-mL volumetric flask. Add *Diluent* to fill 50% of the final volume. Sonicate for 15 min with intermittent swirling, cool to room temperature, and dilute with *Diluent* to volume. Pass this solution through a suitable 2-μm glass filter, and discard the first portion of the filtrate.

Sample solution: 0.1 mg/mL of oxcarbazepine in *Mobile phase* from a portion of the filtrate obtained from the *Sample stock solution*

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μL

Temperatures

Sample: 5°

Column: 50°

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxcarbazepine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxcarbazepine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Test 1

Medium

For Tablets labeled to contain 150 mg: 0.3% (w/v)

sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 300 mg: 0.6% (w/v)

sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 600 mg: 1.0% (w/v)

sodium dodecyl sulfate in water; 900 mL, deaerated

Apparatus 2: 60 rpm

Times: 30 and 60 min

Standard stock solution: 0.35 mg/mL of USP Oxcarbazepine RS in methanol

Standard solution: Dilute the *Standard stock solution* with the corresponding *Medium* to obtain a final concentration of 0.0175 mg/mL of USP Oxcarbazepine RS.

Sample solution: Use portions of the solution under test passed through a suitable filter of 0.45- μ m pore size. The volume of the solution under test withdrawn must be replaced by the same volume of corresponding *Medium*. Dilute with the appropriate *Medium* if necessary, according to the Tablet strength, to obtain a final concentration similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 256 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxcarbazepine ($C_{15}H_{12}N_2O_2$) dissolved at 30 min (Q_{30}):

$$Q_{30} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

Calculate the percentage of the labeled amount of oxcarbazepine ($C_{15}H_{12}N_2O_2$) dissolved at 60 min (Q_{60}):

$$Q_{60} = [(A_U/A_S) \times (C_S/L) \times D \times V \times 100] + [Q_{30} \times (V_S/V)]$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)
 D = dilution factor of the *Sample solution*
 V = volume of *Medium*, 900 mL
 V_S = volume of the solution under test withdrawn (mL)

Tolerances: NLT 70% (Q) of the labeled amount of oxcarbazepine is dissolved in 30 min, and NLT 80% (Q) of the labeled amount of oxcarbazepine is dissolved in 60 min.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium

For Tablets labeled to contain 150 mg: 0.3% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 300 mg: 0.6% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 600 mg: 1.0% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

Apparatus 2: 60 rpm

Times: 30 and 60 min

Standard stock solution: 3.3 mg/mL of USP Oxcarbazepine RS in methanol. [NOTE—This solution is stable for 22 h at 10°.]

Standard solution: Dilute the *Standard stock solution* with the corresponding *Medium*, according to the Tablet strength, to obtain a final concentration of ($L/900$) mg/mL, where L is the label claim in mg/Tablet.

Sample solution: Use portions of the solution under test passed through a suitable filter of 0.45- μ m pore size. The volume of the solution under test withdrawn must be replaced by the same volume of corresponding *Medium*.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 304 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxcarbazepine ($C_{15}H_{12}N_2O_2$) dissolved at 30 min (Q_{30}):

$$Q_{30} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

Calculate the percentage of the labeled amount of oxcarbazepine ($C_{15}H_{12}N_2O_2$) dissolved at 60 min (Q_{60}):

$$Q_{60} = [(A_U/A_S) \times (C_S/L) \times D \times V \times 100] + [Q_{30} \times (V_S/V)]$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)
 D = dilution factor of the *Sample solution*
 V = volume of *Medium*, 900 mL
 V_S = volume of the solution under test withdrawn (mL)

Tolerances

For Tablets labeled to contain 150 or 300 mg: NLT 70% (Q) of the labeled amount of oxcarbazepine is dissolved in 30 min, and NLT 80% (Q) of the labeled amount of oxcarbazepine is dissolved in 60 min.

For Tablets labeled to contain 600 mg: NLT 50% (Q) of the labeled amount of oxcarbazepine is dissolved in 30 min, and NLT 80% (Q) of the labeled amount of oxcarbazepine is dissolved in 60 min.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

[NOTE—On the basis of the synthetic route, perform either *Organic Impurities, Procedure 1* or *Organic Impurities, Procedure 2*. If methoxycarbamazepine is a potential degradation product, *Procedure 1* is recommended. If carbamazepinedione or dibenzazepinodione is a potential degradation product, *Procedure 2* is recommended.]

• ORGANIC IMPURITIES, PROCEDURE 1

Buffer and Chromatographic system: Proceed as directed in the *Assay*.

Diluent: Methanol and water (60:40)

Mobile phase: Methanol, acetonitrile, and *Buffer* (29:21:75)

System suitability solution: 0.5 mg/mL of USP Oxcarbazepine RS and 1.0 μ g/mL of USP Carbamazepine RS in *Mobile phase*

Standard solution: 0.5 μ g/mL of USP Oxcarbazepine RS in *Mobile phase*

Sample stock solution: Nominally equivalent to 1.2 mg/mL of oxcarbazepine from a portion of finely powdered (NLT 20) Tablets, prepared as follows. Transfer a weighed quantity of powdered Tablets, equivalent to 600 mg of oxcarbazepine, to a 500-mL volumetric flask. Add *Diluent* to fill 50% of the final volume. Sonicate for 15 min with intermittent swirling, cool to room temperature, and dilute with *Diluent* to volume. Pass this solution through a suitable 2- μ m glass filter, and discard the first portion of the filtrate.

Sample solution: 0.5 mg/mL of oxcarbazepine from the *Sample stock solution* in *Mobile phase*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 8.0 between oxcarbazepine and carbamazepine, *System suitability solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of oxcarbazepine from the *Standard solution*

- C_s = concentration of USP Oxcarbazepine RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of oxcarbazepine in the *Sample solution* (mg/mL)
 F = relative response factor for the corresponding impurity (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

• ORGANIC IMPURITIES, PROCEDURE 2

Buffer A: 4.2 g of tris(hydroxymethyl)amino methane and 0.2 g of edetate disodium in 1 L of water

Buffer B: 18 g of tris(hydroxymethyl)amino methane and 0.9 g of edetate disodium in 1 L of water

Diluent: Acetonitrile and 1.8 g/L of ascorbic acid in water (1:99)

Solution A: Acetonitrile, tetrahydrofuran, and Buffer A (5:10:85)

Solution B: Acetonitrile, tetrahydrofuran, and Buffer B (70:10:20)

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	95	5
33.0	30	70
33.1	95	5
45.0	95	5

System suitability stock solution: 1 µg/mL of USP Oxcarbazepine Related Compound C RS and 12 µg/mL of USP Carbamazepine RS in acetonitrile. Sonication may be used to aid in dissolution. [NOTE—The water bath temperature should not exceed 23°.]

System suitability solution: 0.05 µg/mL of USP Oxcarbazepine Related Compound C RS, 0.6 µg/mL of USP Carbamazepine RS, and 0.06 mg/mL of USP Oxcarbazepine RS prepared as follows. Transfer a suitable volume of *System suitability stock solution* to a volumetric flask containing 50% of the final volume of *Diluent*. Allow the solution to reach ambient temperature, and dilute with acetonitrile to volume.

Standard stock solution: 12 µg/mL of USP Carbamazepine RS in acetonitrile. Sonication may be used to aid in dissolution. [NOTE—The water bath temperature should not exceed 23°.]

Standard solution: 0.6 µg/mL of USP Carbamazepine RS from *Standard stock solution* prepared as follows. Transfer a suitable volume of *Standard stock solution* to a flask containing 50% of the final volume of *Diluent* and 20% of the final volume of acetonitrile. Allow the solution to reach ambient temperature, and dilute with acetonitrile to volume.

Sample stock solution: 1.5 mg/mL of oxcarbazepine from a portion of finely powdered (NLT 20) Tablets prepared as follows. Transfer a weighed quantity of powdered Tablets, equivalent to about 375 mg of oxcarbazepine, to a 250-mL volumetric flask. Add 150 mL of acetonitrile, and sonicate for 15 min. Shake for 15 min, and dilute with acetonitrile to volume. Mix, and allow the suspension to settle for 30 min. Use the supernatant. [NOTE—The water bath temperature should not exceed 23°.]

Sample solution: 0.3 mg/mL of oxcarbazepine from the *Sample stock solution* prepared as follows. Transfer a suitable volume of *Sample stock solution* to a volumetric flask containing 50% of the final volume of *Diluent* and 20% of the final volume of acetonitrile. Allow the solution to warm to ambient temperature, and dilute with acetonitrile to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used. If a test for *Organic Impurities* other than *Procedure 1* is used, the labeling states the test with which the article complies.
- **USP REFERENCE STANDARDS (11)**
 - USP Carbamazepine RS
 - USP Oxcarbazepine RS
 - USP Oxcarbazepine Related Compound C RS
 - Acridin-9(10H)-one.
 - C₁₃H₉NO 195.22

Oxfendazole

C₁₅H₁₃N₃O₃S 315.35

Carbamic acid, 5-(phenylsulfinyl)-1H-benzimidazol-2-yl-, methyl ester.

Methyl 5-(phenylsulfinyl)-2-benzimidazolecarbamate [53716-50-0].

» Oxfendazole contains not less than 98.0 percent and not more than 100.5 percent of C₁₅H₁₃N₃O₃S, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Fenbendazole RS

USP Oxfendazole RS

Identification—

A: *Infrared Absorption* (197K).

B: The appearance of the principal spot in the chromatogram of the *Test solution* corresponds to that in the chromatogram of *Standard solution 1*, as obtained in the test for *Related compounds*.

Loss on drying (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 105° for 2 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Related compounds—

Diluent—Prepare a mixture of ethyl acetate and glacial acetic acid (4:1).

Standard solution 1—Dissolve a quantity of USP Oxfendazole RS in *Diluent* to obtain a solution having a concentration of 0.1 mg per mL.

Standard solution 2—Dissolve a quantity of USP Fenbendazole RS in *Diluent* to obtain a solution having a concentration of 0.05 mg per mL.

Standard solution 3—Prepare a mixture of *Standard solution 1* and *Standard solution 2* (1:2).

Test solution—Dissolve 25 mg of Oxfendazole in *Diluent*, dilute with *Diluent* to 5 mL, and mix.

Procedure—Separately apply 20 µL portions of *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate and glacial acetic acid (95:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, and allow to air-dry. Examine the plate under short-wavelength UV light: the chromatogram obtained from *Standard solution 3* shows two clearly separated principal spots. In the chromatogram obtained from the *Test solution*, no spot corresponding to fenbendazole is more intense than the spot in the chromatogram obtained from *Standard solution 2* (1%), and no spot other than the principal spot and no spot corresponding to fenbendazole is more intense than the spot in the chromatogram obtained from *Standard solution 1* (2%).

Assay—Dissolve about 300 mg of Oxfendazole, accurately weighed, in 3 mL of anhydrous formic acid. Add 40 mL of acetic anhydride, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 31.54 mg of C₁₅H₁₃N₃O₃S.

Oxfendazole Oral Suspension

» Oxfendazole Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxfendazole (C₁₅H₁₃N₃O₃S).

Packaging and storage—Preserve in tight containers, and protect from excessive heat.

Labeling—Label the Suspension to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Oxfendazole RS

Identification—The relative retention time of the oxfendazole peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

pH (791): between 4.3 and 4.9.

Assay—

Mobile phase—Prepare a solution of sodium acetate in water containing 2.5 mg per mL, and adjust with glacial acetic acid to a pH of 4.75 ± 0.1. Prepare a mixture of this solution and acetonitrile (800:225). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Prepare a solution in *Mobile phase* containing in each mL about 1.2 µg of methylparaben, 12 µg of sulfabenzamide, and 72 µg of USP Oxfendazole RS.

Internal standard solution—Prepare a solution of sulfabenzamide in *Mobile phase* containing about 0.3 mg per mL.

Standard preparation—Prepare a solution of USP Oxendazole RS in methanol having a known concentration of about 900 µg per mL. Transfer 20.0 mL of this solution to a 100-mL volumetric flask, add 4.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix. This solution contains about 180 µg of USP Oxendazole RS per mL.

Assay preparation—Transfer an accurately measured volume of the Suspension, previously well-mixed and free from air bubbles, equivalent to about 450 mg of oxendazole, to a 500-mL volumetric flask. Add about 30 mL of water, and swirl to disperse. Add about 300 mL of methanol, and dissolve with the aid of sonication. Transfer 20.0 mL of this solution to a 100-mL volumetric flask, add 4.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector, a guard column containing packing L2, and a 4.6-mm × 25-cm analytical column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for sulfabenzamide, 0.8 for methylparaben, and 1.0 for oxendazole; the resolution, R_s , between the methylparaben peak and the oxendazole peak is not less than 2.0; the column efficiency determined from the oxendazole peak is not less than 2000 theoretical plates; and the relative standard deviation of replicate injections is not more than 1.5%. [NOTE—The detector sensitivity may be changed between the peaks to keep the responses on scale.]

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the responses for the major peaks. Calculate the quantity, in mg, of oxendazole ($C_{15}H_{13}N_3O_3S$) in each mL of the Suspension taken by the formula:

$$2.5(C/V)(R_U/R_S)$$

in which C is the concentration, in µg per mL, of USP Oxendazole RS in the *Standard preparation*; V is the volume, in mL, of Suspension taken to prepare the *Assay preparation*; and R_U and R_S are the ratios of the oxendazole peak response to the sulfabenzamide peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Oxprenolol Hydrochloride

$C_{15}H_{23}NO_3 \cdot HCl$ 301.81

2-Propanol, 1-(*o*-allyloxyphenoxy)-3-isopropylamino-, hydrochloride.

1-(*o*-Allyloxyphenoxy)-3-isopropylamino-2-propanol hydrochloride [6452-73-9].

» Oxprenolol Hydrochloride contains not less than 98.5 percent and not more than 101.0 percent of $C_{15}H_{23}NO_3 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Oxprenolol Hydrochloride RS

Clarity of solution—Dissolve 1 g in 10 mL of water: solution is clear.

Identification—

A: Infrared Absorption (197K).

B: A solution of it responds to the tests for *Chloride* (191).

pH (791): between 4.0 and 6.0, in a solution (1 in 10).

Loss on drying (731)—Dry about 3 g of it in vacuum at 60° for 6 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II** (231): 0.001%. • (Official 1-Jan-2018)

Chromatographic purity—

Diluting solvent—Prepare a mixture of chloroform and dehydrated alcohol (1:1).

Standard solution A—Prepare a solution of USP Oxprenolol Hydrochloride RS in *Diluting solvent* containing 20 mg per mL.

Standard solution B—Dilute an accurately measured volume of *Standard solution A* quantitatively, and stepwise if necessary, with *Diluting solvent* to obtain a solution containing 0.08 mg per mL.

Test solution—Transfer 200 mg of it to a 10-mL volumetric flask, dissolve in *Diluting solvent*, dilute with *Diluting solvent* to volume, and mix.

Procedure—Apply separate 5-µL portions of the *Test solution* and the *Standard solutions* to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, previously washed with methanol until the solvent front reaches the top of the plate, dried first in air and then at 100° for 20 minutes, and cooled in a desiccator. Allow the spots to dry. Line a suitable chromatographic chamber with filter paper, saturate the paper with 100 mL of a solvent system consisting of a mixture of ethyl acetate, glacial acetic acid, and water (15:5:5), and allow to stand for about 30 minutes. Place the plate in the chamber, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber and dry at 100° for 15 minutes. Spray the plate uniformly with a detection reagent consisting of a freshly prepared mixture of equal volumes of potassium ferricyanide solution (1 in 100) and ferric chloride solution (1 in 5). Dry the plate in a current of warm air for about 5 minutes or until a spot from *Standard solution B* is visible. Examine the chromatograms in ordinary light: the R_f value of the principal spot from the *Test solution* corresponds to that obtained from *Standard solution A*. No spot other than the principal spot obtained from the *Test solution* exceeds in size or intensity the principal spot obtained from *Standard solution B* (0.4%, corresponding to 0.2% of related compounds, the response factors for which are about double that of oxprenolol hydrochloride).

Assay—Dissolve about 450 mg of Oxprenolol Hydrochloride in 100 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass-calomel electrode system (with a salt bridge of a saturated solution of lithium chloride in glacial acetic acid). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 30.18 mg of $C_{15}H_{23}NO_3 \cdot HCl$.

Oxprenolol Hydrochloride Tablets

» Oxprenolol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxprenolol hydrochloride ($C_{15}H_{23}NO_3 \cdot HCl$).

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Oxprenolol Hydrochloride RS
